KEY TO PRONUNCIATION

ā	as in ale, fate. Also see æ , below.	D	as in the Spanish Almodovar, <i>algada</i> , where it is nearly like <i>th</i> English then, this.
ā	" " senate, chaotic.	g	" " go, get.
ā	" " glare, care, and as <i>e</i> in there See æ , below.	g	" " the German Landtag, <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
ā	" " am, at.	H	" <i>j</i> in the Spanish Jijona, the Spanish gila; where it is a <i>h</i> somewhat resembling the sound <i>h</i> in English hue or <i>y</i> in yet, but <i>stiffer</i> .
ā	" " arm, father.	hw	" <i>wh</i> in which.
ā	" " ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> (<i>ū</i>).	K	" <i>ch</i> in the German ich, Albt, and <i>g</i> in the German Arensburg, Menburg, where it is a fricative sound between the tongue and the hard <i>p</i> toward which the tongue is raised. resembles the sound of <i>h</i> in hue, on yet, or the sound made by beginning to pronounce a <i>k</i> , but not complete stoppage of the breath. The char <i>k</i> is also used to indicate the rough rates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word <i>m</i> .
a	" " final, regal, where it is of a neutral or obscure quality.	n	" in sinker, longer.
a	" " all, fall.	ng	" " sing, long.
a	" " eve.	N	" " the French bon, Bourbon and <i>m</i> in the French Étampes, where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>N</i> , as in the word São Antão.
ā	" " clate, evade.	sh	" " shine, shut.
ā	" " end, pet. The characters <i>æ</i> , <i>ā</i> , and <i>ā</i> are used for <i>a</i> , <i>ae</i> in German, as in Baedeker, Grafe, Handel, to the values of which they are the nearest English vowel sounds. The sound of Swedish <i>ä</i> is also sometimes indicated by <i>æ</i> , sometimes by <i>ā</i> or <i>ī</i> .	th	" " thrust, thin.
ā	" " fern, her, and as <i>i</i> in sir. Also for <i>o</i> , <i>oe</i> , in German, as in Gothe, Goethe, Ortel, Oertel, and for <i>eu</i> and <i>oeu</i> in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.	TH	" " then, this.
e	" " agency, judgment, where it is of a neutral or obscure quality.	zh	" <i>z</i> in azure, and <i>s</i> in pleasu
i	" " ice, quiet.	An apostrophe [<i>'</i>] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kǎz'm (chasm).	
i	" " quiescent.	Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.	
i	" " ill, fit.	When the pronunciation is scientifically shown by indicating the accented syllable, this is done without respelling; as in the case of very common English words, and words which so spelled as to insure their correct pronunciation if they are correctly accented. Pronunciation is discussed in the NEW INTERNATIONAL ENCYCLOPEDIA.	
ō	" " old, sober.		
ō	" " obey, sobriety.		
ō	" " orb, nor.		
ō	" " odd, forest, not.		
o	" " atom, carol, where it has a neutral or obscure quality.		
oi	" " oil, boil, and for <i>eu</i> in German, as in Feuerbach.		
oo	" " food, fool, and as <i>u</i> in rude, rule.		
ou	" " house, mouse.		
ū	" " use, mule.		
ū	" " unite.		
ū	" " cut, but.		
u	" " full, put, or as <i>oo</i> in foot, book. Also for <i>u</i> in German, as in Munchen, Müller, and <i>u</i> in French, as in Buchez, Budé; to which it is the nearest English vowel sound.		
ū	" " urn, burn.		
y	" " yet, yield.		
B	" " the Spanish Habana, Córdoba, where it is like a <i>v</i> made with the lips alone, instead of with the teeth and lips.		
ch	" chair, cheese.		

M

McADOO, WILLIAM GIBBS (1863-). An American cabinet officer (see VOL XV). In 1913 he was appointed Secretary of the Treasury by President Wilson. His tenure of this office was marked by the enormous complications and transactions of the entrance of the United States into the World War, and in this work he showed great versatility and efficiency. In addition to his duties as Secretary of the Treasury, he was also Director General of Railways in 1917-19 and *ex-officio* chairman of the Federal Reserve Board. He resigned as Secretary of the Treasury on Dec. 10, 1918, and as Director General of Railways on Jan. 10, 1919. On May 7, 1914, he married Eleanor Wilson, daughter of President Woodrow Wilson. In the Democratic National Convention held in New York City in 1924, McAdoo and Governor Smith of New York controlled enough votes to checkmate each other. The result was that neither was nominated, and John W. Davis was selected as a compromise candidate after more than 100 ballots had been cast. Later, Mr. McAdoo engaged in law practice at Los Angeles and Washington, D. C., taking little part in the presidential campaign of 1928. See RAILWAYS.

MACALESTER COLLEGE. A coeducational liberal arts college under Presbyterian auspices at St. Paul, Minn., opened in 1885, as the outgrowth of two academies founded by a pioneer missionary in Minnesota, the Rev. Edward Duffield Neill, D.D. The number of students increased from 399 in 1913 to 497 in 1927-28, the faculty from 21 to 56 members, and the library from 13,600 to 19,300 volumes. The endowment of the college in 1928 amounted to \$1,259,837 and the income to \$220,832 in 1927-28. The Macalester Forward Movement, launched in 1925, secured for the college \$825,000 in pledges and gifts, of which amount over \$400,000 was given by the Board of Trustees; between 1924 and 1928, four new buildings were erected on the campus: a gymnasium and a men's dormitory, each costing approximately \$200,000; a central heating plant; and the president's residence. Among the outstanding gifts to the college was that of \$50,000 from Thomas W. Synott to be held in trust by the Board of Christian Education of the Presbyterian Church, U. S. A., for the maintenance of a chair in the Department of Religious Education. President, John C. Acheson, A. M., LL. D.

McALEXANDER, ULYSSES GRANT (1864-). An American army officer, born in Dundas, Mich. He was graduated from the United States Military Academy in 1887 and commissioned second lieutenant in the same year. During the Spanish-American War, he served in the field and was recommended for promotion for gallantry under fire. He saw service also in the Philippines and in 1906 was a member of the General Staff Corps. After serving as instructor of troops in 1916-17, he was given command of

the 18th Infantry in France. As commander of the 38th Infantry, he took part in the second Battle of the Marne and in other campaigns. He was credited with breaking the great German offensive on the Marne on July 15, 1918, and won the sobriquet of "The Rock of the Marne." In July, 1924, he was promoted to the rank of major general and in the same year retired on account of physical disability. He received decorations from the American, French, and Italian governments. He wrote *History of the Thirtieth Regiment* (1905).

McALLISTER, ADDAMS STRATTON (1875-). An American electrical engineer (see VOL. XIV). During 1918 he became connected with the Ordnance Department, Washington, D. C., and in 1921 with the Bureau of Standards. Since 1923 he has been engineer-physicist of the Bureau of Standards. He contributed many articles on engineering subjects to technical publications during the period 1914-24 and published *The Descendants of John Thomson* (1917). He compiled and edited the *National Directory of Commodity Specifications* (U. S. Dept. of Commerce, 1925), *Standard Year Book* (1927); *Directory of Commercial Testing and College Research Laboratories* (1927), *Standards and Specifications in the Wood-Using Industries* (1927).

McANDREW, WILLIAM (1863-). An American school administrator and editor. He was born at Ypsilanti, Mich., and graduated at the University of Michigan (1886). He was superintendent of schools at St. Clair, Mich., (1886-88), teacher and principal of the Hyde Park High School, Chicago (1889-91), and for two years district passenger agent of the Great Northern Railway at St. Paul, Minn. He then became principal of the Pratt Institute High School, Brooklyn, N. Y. (1892-98) and later organized the Washington Irving High School (for girls) of New York City, serving as principal until 1914. For ten years (1914-24), he was associate superintendent of schools in New York City and was then called to Chicago as superintendent of schools of that city. In the same year (1924), he became editor of the *Educational Review*. In 1927 his retention in office at Chicago became a political issue because of the campaign promise of Mayor William Hale Thompson to bring about his removal. A trial was begun on charges of insubordination, but various other accusations were injected into the proceedings. After hearings occupying several months, the Board of Education voted for his dismissal. His contract had already expired. He continued as editor of the *Educational Review* and in that capacity won commendation from well-known educators throughout the country. He is the author of *The Public and Its School* (1916).

MacARTHUR, DOUGLAS (1880-). An American soldier, born in Arkansas, graduated from the United States Military Academy in 1903 and was commissioned second lieutenant in the same year. He was

appointed colonel of infantry in the National Army and in the same year became Chief of Staff of the 42d Division. He commanded the 84th Infantry Brigade in 1918 and the 42d Division later in the same year. He took part in all the great operations in France and served with the Army of Occupation in Germany. He was made a brigadier general of the Regular Army in 1920, and major general in 1925. In 1919 he was appointed superintendent of the United States Military Academy and in 1922-25 commanded the Department of the Philippines. He received several divisional citations and decorations from the French, Italian, and Belgian governments.

McBAIN, HOWARD LEE (1880-). An American lawyer and educator, born in Toronto, Canada. He graduated from Richmond (Va.) College in 1900 and afterward studied at Columbia and the University of Chicago. After teaching in schools in Richmond, he lectured on constitutional history at the University of Virginia. He was appointed instructor of political science at Columbia in 1907, and in 1909 he became dean of the College of Political Science at George Washington University. From 1910 to 1913, he was associate professor of political science at the University of Wisconsin. In 1913-17 he was associate professor of municipal science and administration and in 1917-25 Eaton professor at Columbia University. Since 1925 he has been Ruggles professor of constitutional law there. He was a member of many legal and learned societies and the author of *How We Are Governed in Virginia and the Nation* (1908); *The Law and Practice of Municipal Home Rule* (1916); *American City Progress and the Law* (1917); *The New Constitutions of Europe* (with L. Rogers, 1922); *The Living Constitution* (1927); *Prohibition, Legal and Illegal* (1928).

McCARRISON, ROBERT (1878-). An Irish physician. Born in Lisburn, County Antrim, he was educated at Queen's College, Belfast, and entered the Indian Medical Service in 1901. He developed a special interest in goitre and cretinism and during 1913-14 investigated these affections for the Government. Later, he visited many medical centres in English-speaking countries to lecture on goitre and made a tour of the United States for this purpose in 1921. His major writings are *Collected Papers on Goitre and Cretinism* (1916); *The Thyroid Gland in Health and Disease* (1917); *Studies in Deficiency Disease* (1921), and *The Simple Goitres* (1928). He was placed in charge of the Pasteur Institute at Coonoor on its establishment and was a special worker for the Research Fund Association of India, 1918-26.

MACAULAY, ROSE (?-). A British novelist, who was also a journalist and a poetress. Her novels, full of humor and wit, powerful description and sound character studies, depict the age in which she lived, often with a satiric turn. They are *The Furnace* (1907); *What Not, A Prophetic Comedy* (1919); *Potatism* (1920); *Dangerous Ages* (1921); *Myself at Geneva* (1922); *Told by an Idiot* (1924); *Orphan Island* (1924); and *Crewe Train* (1925). Her poems include *The Two Blind Men* (1914). Her essays were collected in *Commentary* (1925), and she wrote one correct usage of the English language entitled *Words and Claptrap* (1915).

MACDONALD, CHARLES CALDWELL (1859-). A lawyer and public official (see from 1910 to 1926 he served as

a member of the Interstate Commerce Commission, being chairman at various periods after 1915. In 1918-19 he was a member of the Railway Wage Commission and arbitrator of the War Labor Board.

McCOLLUM, ELMER VERNER (1879-). An American physiological chemist, born near Ft. Scott, Kan., and educated at Kansas and Yale universities. From 1907 to 1917, he held the chair of agricultural chemistry in the University of Wisconsin, resigning to accept the professorship of biochemistry in the Johns Hopkins University School of Hygiene and Public Health. He has published many papers on nutrition, diet, vitamins, etc., and several textbooks, which include *Textbook of Organic Chemistry* (1916); *The Newer Knowledge of Nutrition* (1918); *The American House Diet* (1920); and *Foods, Nutrition, and Health* (1925). Professor McCollum has published an account of the fourth vitamin, known as Vitamin D, lack of which from the nutriment is believed to play an important rôle in the genesis of rickets. He received the Howard N. Potts Gold Medal of the Franklin Institute (1921), the Isaac Ridgeway Trimble Medal (1923), and the John Scott Medal from the City of Philadelphia (1924).

McCOMBS, WILLIAM FRANK (1875-1921). An American lawyer (see VOL. XIV). From 1912 until 1916, he was chairman of the Democratic National Committee. He was offered but declined the ambassadorship to France. A volume giving Mr. McCombs' side of his controversy with President Wilson concerning the recognition accorded him for securing the nomination of Mr. Wilson, was published in 1921.

McCONNELL, FRANCIS JOHN (1871-). An American bishop of the Methodist Episcopal Church (see VOL. XIV). In 1928 he was transferred from Pittsburgh to the New York area. At the same time, he was elected president of the Methodist Board of Foreign Missions, and shortly afterward he succeeded Dr. S. Parkes Cadman (q.v.) as president of the Federal Council of Churches of Christ in America. Bishop McConnell has had extensive experience in the mission fields and in social work. An investigation of the steel industry by the churches in 1920 was headed by him. He is the author of *Democratic Christianity* (1919); *Church Finance and Social Ethics* (1920); *Public Opinion and Theology* (1920), *Living Together* (1923); *Is God Limited?* (1924); *The Christ-like God* (1927); and *Humanism and Christianity* (1928).

McCORMICK, CYRUS HALL (1859-). An American manufacturer, born at Washington, D. C., and educated in the public schools. Entering his father's business, he invented the reaping machine and was president of the McCormick Harvesting Machine Company from 1894 to 1902 and of the International Harvester Company from 1902 to 1919, when he became chairman of the board. In 1917 he was a member of the special diplomatic mission of the United States to Russia. He was a trustee of Princeton University and a director of the McCormick Theological Seminary.

McCORMICK, PAUL JOHN (1879-). An American jurist, who was born in New York City and studied at the San Diego, Calif., High School; All Hallows College, Salt Lake City; and St. Ignatius College, San Francisco. For two years, he was assistant librarian at the Los

Angeles County Law Library. He served as assistant district attorney of Los Angeles County from 1905 to 1910, and as judge of the Superior Court of Los Angeles County from 1910 to 1924. By appointment of President Coolidge, he became United States district judge in the southern district of California in February, 1924. He decided the case of the United States v. Pan-American Petroleum Company, concerning the lease of 30,000 acres of land in the Naval Oil Reserve of California and involving the issue of fraud by Secretary of the Interior Fall in making the lease. For 12 years (1912-24), Judge McCormick was instructor in law at the University of Southern California. In May, 1929, President Hoover appointed him to the National Law Enforcement Commission.

MCCORMICK, RUTH HANNA (1880-). An American Congresswoman. She was born at Cleveland, Ohio, a daughter of the late Senator Marcus A. Hanna. Her formal education was received in private schools. In 1903 she married Modill McCormick (died, 1925). Interested in political, civic, and industrial problems, she took an active part in the Progressive movement in the Republican Party in 1912. Since 1924 she has been a member of the Republican National Committee from Illinois. In 1928 she was elected to Congress as Representative.

MCCORMICK, VANCE CRISWELL (1872-). An American newspaper publisher and public official, born in Harrisburg, Pa., and educated at Yale University. For several years, he was engaged in the newspaper business in Harrisburg. He served as mayor of that city from 1902 to 1905. In 1914 he was Democratic candidate for governor and in 1916 served as chairman of the Democratic National Campaign Committee. He was chairman of the War Trade Board from 1917 to 1919 and in the former year was also a member of the War Commission sent to Great Britain and France. At the peace conference in Paris, he acted as adviser to the American commission.

MCCOY, FRANK ROSS (1874-). An American soldier, born in Lewistown, Pa. He was graduated from the United States Military Academy in 1897 and was appointed 2d lieutenant of the 8th Cavalry in the same year. He served on the western frontier in Cuba, in the Philippines, and in the Santiago campaign. In Cuba and the Philippines, he acted as aide to General Wood and was for several years aide to President Roosevelt. He was appointed a member of the General Staff in 1911 and after service as military attaché in Mexico became a member of the General Staff of the American Expeditionary Forces in 1917. He commanded the 63d Infantry Brigade in 1918 and was director of the Army Transport Service and deputy director general and later director general of transportation for the A. E. F. in 1918-19. In the latter year, he also served as chief of staff to the American military mission to Armenia and as special commissioner to the Philippines. He was appointed by President Coolidge to supervise the presidential election of Nicaragua in 1928 and was also chairman of the commission to conciliate the boundary disputes between Bolivia and Paraguay in 1928-29. He was promoted to the rank of major general in 1929. He wrote *Principles of Military Training* (1918).

MACCRACKEN, WILLIAM PATTERSON, JR. (1888-). An American lawyer and public official, who was born in Chicago and educated at

the law school of the University of Chicago. Admitted to the Illinois bar in 1911, he began practice in Chicago and became Assistant Attorney General of Illinois in 1923 and assistant state's attorney of Cook County in 1924. During 1917-18 he served in the U. S. Air Service. From Aug. 11, 1926, to March, 1929, he was Assistant Secretary of Commerce for Aeronautics. He served also as secretary of the American Association.

MCCULLOUGH, ERNEST (1867-). An American civil engineer, born on Staten Island, N. Y., and educated at the Van der Naillen School of Engineering in San Francisco. During 1893-96 he was editor of *Engineer and Contractor* in San Francisco; he became associate editor of *Engineering-Contracting* (Chicago) in 1909 and of the *Railway Age* in 1910. He was later an associate editor of *The American Architect* and in 1925 became editor of *Building Age and National Builder*, New York. During the World War, he was a lieutenant colonel in the Chemical Warfare Service in France, and in 1919-20, director of the officers' school for that service at Lakehurst, N. J. He is the author of *Country Roads* (1891); *Farm Drainage* (1892); *Municipal Public Works* (1894); *Engineering Work in Towns and Cities* (1906); *Reinforced Concrete* (1908); *Engineering as a Vocation* (1911); *Practical Surveying* (1915); *Practical Structural Design* (1917); *Everybody's Money* (1923); and *Class Warfare* (1927).

MCCULLY, NEWTON ALEXANDER (1867-). An American naval officer, born in Anderson, S. C. He graduated from the United States Naval Academy in 1887 and in 1889 was made ensign. He was promoted to be commander in 1900, captain in 1913, and rear admiral in 1918. From 1914 to 1917, he was naval attaché at St. Petersburg and represented the Navy Department in connection with the Russian commission to the United States. In 1917-18 he commanded the patrol squadron off the coast of France and in 1919 was commander of the American naval forces in American waters. In 1920 he acted as special agent for the Department of State in southern Russia. He was chief of the Naval Mission to Brazil, 1925-27.

MACCURDY, GEORGE GRANT (1863-). An American anthropologist (see Vol. XIV). Since 1923 he has been research associate, with the rank of professor, and curator of anthropological collections at Yale. He was also director of the American School of Prehistoric Research in Europe (1921-22, and after 1924). He became a member of the National Research Council in 1925. Professor MacCurdy is the author of *Human Skeletal Remains from the Highlands of Peru* (1923); and *Human Origins—Manual of Prehistory* (2 vols., 1924).

MCOUTCHEON, GEORGE BARR (1866-1928). An American author (see Vol. XIV). He was president of the Author's League of America in 1924-26. He wrote *From the House Tops* (1916); *The Light That Lies* (1917); *Green Fancy* (1917); *Shot with Crimson* (1918); *The City of Masks* (1918); *Sherry* (1919); *Anderson Crow, Detective* (1920); *West Wind Drift* (1920); *Quill's Window* (1921); *Yol-lopp* (1922); *Viola Gwyn* (1922); *Oliver October* (1923); *East of the Setting Sun* (1924); *Romeo in Moon Village* (1925); *Kindling and Ashes* (1926); *The Inn of the Hawk and Raven* (1927); *Blades* (1928); and *The Meruales* (1929).

McCUTCHEON, JOHN TINNEY (1870-). An American author and cartoonist, born in Tippecanoe County, Ind., a brother of George Barr McCutcheon (see above). He was graduated at Purdue University. He was on the staff of the *Chicago Record* and *Record-Herald* (1889-1903), where he began drawing political cartoons in the national campaign of 1896. Much of his work, however, has been outside the field of politics. He was on the dispatch boat *McCulloch* in the Battle of Manila Bay, May 1, 1898. In the military occupation of the Philippines and in the Boer War, he was an observer and correspondent. He joined the Boers in the interest of the *Chicago Record*. He was at Vera Cruz, Mex., in 1914 and later in the year was with the Belgian and German armies in the World War. In 1915-16 he was in France, Saloniki, and the Balkans. He is the author of *Stories of Filipino Warfare* (1900); *Cartoons by McCutcheon* (1903); *Bird Center Cartoons* (1904); *The Mysterious Stranger* (1905); *Congressman Pumphrey, The People's Friend* (1907); *In Africa* (1910); *T R in Cartoons* (1910); *Dawson '11, Fortune Hunter*, (1912); *The Restless Age* (1921); and *An Heir at Large* (1923).

McDERMOTT, GEORGE ROBERT (1860-). An American naval architect, born at Glasgow, Scotland. After an academic and technical education in Glasgow, he served as naval architect for several shipbuilders in Scotland and in the naval construction works in England. He removed to the United States and was successively assistant professor of naval architecture and professor of naval architecture in charge of the Department of Naval Architecture and Marine Engineering at Sibley College in Cornell University. During the World War, he served with the U. S. Shipping Board and the Emergency Fleet Corporation and as technical adviser of the American Bureau of Shipping in 1919. He is the author of *Screw Propeller Computer* and *Text-Book on Screw Propellers* (1903).

McDONALD, ELLICE (1876-). An American cancer investigator and chemist. He was born at Fort Ellice, Can., and graduated at McGill University in 1897 (M.D., 1901). From 1907 to 1922, he was surgeon at the New York Post-Graduate Medical School. Since 1922 he has been assistant professor of gynecology and director of the cancer research laboratory of the University of Pennsylvania Graduate School of Medicine. He has studied particularly the application of the atomic theory to cancer research. He is the author of *Blood Studies in Cancer* (1929).

MACDONALD, THE RT HON. JAMES RAMSAY (1866-). A British Prime Minister and leader of the Labor Party (see VOL. XIV). He was not in sympathy with Great Britain's entry into the World War and resigned as leader of the Labor Party in 1914. He was defeated for Parliament in the "khaki election" of 1918, but was returned in 1922 and became official leader of the Opposition, the Labor Party having become the second party in the House of Commons. From January to November, 1924, he was Prime Minister, First Lord of the Treasury, and Secretary of State for Foreign Affairs in the first Labor government of Great Britain. His domestic policy was characterized by unexpected moderation. Great Britain recognized Soviet Russia on Feb. 2, 1924, and an Anglo-Russian treaty was signed which was never ratified. He also summoned the conference in

London which led to the adoption of the Dawes Plan and consistently advocated leniency toward the Central Powers and cooperation with the League of Nations. Publication by the Conservatives of the so-called "Zinovieff letter," the authenticity of which was later questioned, led to his overwhelming defeat in the general election in November. During a lecture tour of the United States in 1927, his health broke down but he gradually recovered and resumed his activities as leader of the Labor Party in Parliament. He became Prime Minister and First Lord of the Treasury for the second time in June, 1929, as a result of a Labor victory in the general election. He immediately renewed negotiations toward a naval armament limitation agreement with the United States and the resumption of diplomatic relations with Soviet Russia. In October, 1929, at the invitation of President Hoover, he paid an official visit to the United States to discuss with the President naval limitation and other Anglo-American problems. The first British Prime Minister to visit America while in office, he was enthusiastically received in New York, Washington, and Philadelphia, and by the United States Senate, which he was invited to address. A few days after his arrival in Washington, where he was the guest of President Hoover at the White House, and at the President's summer camp, a statement summarizing the discussions jointly prepared was issued at the conclusion of Premier MacDonald's visit. A call for a five-power naval conference to begin the third week in January, 1930, in London, was issued by the British Foreign Office during his stay in Washington. While at the capital he received the honorary degree of LL.D. from George Washington University. On his way back to London, Premier MacDonald made notable addresses in New York and visited several of the Canadian cities. Internally, the first months of his administration were marked by a strike of more than 500,000 cotton-mill workers in Lancashire. His writings include *National Defence: A Study in Militarism* (1917); *The Government of India* (1919); *Parliament and Revolution* (1920); *Socialism: Critical and Constructive* (1921); *Margaret Ethel MacDonald* (1924); and *Wanderings and Excursions* (1925). Consult *From Doughty Street to Downing Street*, by Herbert Tracy (1924); *J. Ramsay MacDonald, 1823-25*, by "Iconoclast" (Mary Agnes Hamilton) (1925); and *J. Ramsay MacDonald, Labor's Man of Destiny* by H. Hessel Tiltman (1929).

McDOUGALL, WILLIAM (1871-). An Anglo-American psychologist (see VOL. XIV). During the World War, he was attached to the medical service of the British Army. In 1920 he was called from his post at Oxford to head the psychology department at Harvard University. Since 1927 he has been professor of psychology at Duke University, Durham, N. C. In his *Outline of Psychology* (1923), he modified his conception of instinct so as to allow for growth and transformation of the presumed hereditary dispositions.

Professor McDougall's other works deal largely with the problems of national psychology which transcend mere science and involve ethical theory. *The Group Mind* (1920) and *Is America Safe for Democracy?* (1921) defend the superiority of the Nordic race. *Ethics and Some Modern World Problems* (1924) contains a warning against sentimental idealism as a guid-

ing principle of national conduct. He also wrote *Outline of Abnormal Psychology* (1926); *Janus* (1927); and *Character and the Conduct of Life* (1927). He took a leading part in the activities of both the British Societies for Psychological Research. See SOCIAL PSYCHOLOGY.

McELROY, ROBERT (McNUTT) (1872-). An American educator, born at Perryville, Ky., and educated at Princeton University, in Germany, and at Oxford. In 1898 he was instructor of history at Princeton and was successively assistant professor of American history and Edwards professor of American history (1909-25). He was also head of the department of history and politics at Princeton, 1912-16, was the first American exchange professor to China in 1916-17, and was educational director of the National Security League from 1917 to 1919. He was appointed Harmsworth professor of American history at Oxford for the term 1925-35 and Sir Charles Watson lecturer in American history, 1926. He was a member of many learned societies and wrote *Kentucky in the Nation's History* (1909); *The Winning of the Far West* (1914); *The Representative Idea in History* (1917); *Grover Cleveland—the Man and the Statesman* (1923); and *The Pathway of Peace* (1927). He edited a collection of speeches of W. Bourke Cockran (1925) and was coeditor of *Putman's Historical Atlas*, also *Phelps Historical Atlas* (1927).

McELWAIN, FRANK ARTHUR (1875-). An American bishop of the Protestant Episcopal Church, born at Warsaw, N. Y., and educated at Trinity College and the Seabury Divinity School. He was ordained in 1903, held several pastorates in Missouri and from 1907 to 1912, was warden of the Seabury Divinity School. In 1912 he was elected Suffragan Bishop of Minnesota and was consecrated bishop in 1917.

McFARLAND, JOSEPH (1868-). An American pathologist and bacteriologist, born at Philadelphia. Soon after receiving his M.D. from the University of Pennsylvania in 1889, he became professor of pathology and bacteriology in the Medicochirurgical College, from which he resigned in 1916 to take a similar chair in the University of Pennsylvania. He has published several textbooks: *Pathogenic Bacteria* (1886), *Textbook of Pathology* (1904); and *Biology, General and Medical* (1910). A semi-popular work, *Fighting Foes too Small to See*, was published in 1924, and in the same year his *Surgical Pathology*. He also collaborated with Dr John B. Deaver in *The Breast* (1917).

McFEE, WILLIAM (1881-). An American author, born in London and educated in the East Anglican School, Bury St Edmunds, England. He entered the marine service as engineer and chief engineer of transports. In 1911 he went to the United States. He wrote *An Ocean Tramp* (1908), which was followed by *Aliens* (1914), *Casuals of the Sea* (1916); *Captain Macedoine's Daughter* (1920); *A Six-Hour Shift* (1920); *Harbors of Memory* (1921); *Command* (1922); *Race—a Prelude* (1924); *Swallowing the Anchor* (1925); *Sunlight in New Granada* (1925); *The Life of Sir Martin Frobisher* (1928); *Pilgrims of Adversity* (1928); and *Sailors of Fortune* (1929). His books show great descriptive power and an unusually attractive style.

McGILL UNIVERSITY. A Canadian institute at Montreal, Quebec, founded in 1821, standing at the head of a group of affiliated col-

leges and schools, and itself affiliated with the universities of Oxford, Cambridge, and Dublin. The student enrollment numbered 1600 in 1914, dropped during the War to 1045, but rose to 2875 in the autumn session of 1928. The enrollment in the French Summer School of 1928 was 193. The faculty increased from 265 to 473 members and the annual income from \$820,000 to \$2,046,688. The library was increased from 184,000 to 273,633 volumes. The productive funds of the University amounted to \$18,153,446 in 1928, as compared with \$8,207,000 in 1914. The university received \$1,000,000 in 1918 from the Carnegie Corporation of New York, "in recognition of the noble and devoted service and sacrifice of McGill toward Canada's part in the great war." Sir William C. MacDonald bequeathed various sums to the University, including \$500,000 toward the endowment of the Medical School, \$300,000 toward the endowment of the Conservatory of Music, \$20,000 to provide traveling scholarships in the faculty of law, and \$1,000,000 for MacDonald College. The University also received \$100,000 from the estate of James Ross in 1914. In 1920 subscriptions made to the Centennial Fund totaled \$4,440,000, not including gifts of \$1,000,000 each from the Rockefeller Foundation and from the Quebec government. In 1924 the Rockefeller Foundation made a gift of \$500,000 for medical research, Lady Roddick gave \$50,000 for the erection of gates in memory of her late husband, Sir Thomas Roddick; and Lady Strathcona gave \$120,000 to endow the chair of zoology. In 1928 Lady Osler, widow of Sir William Osler, bequeathed £10,000 for the upkeep of the Osler Library at the University.

A biological building was erected in 1922 at a cost of \$716,000, and a pathological building costing \$450,000, was opened in 1924; an electrical engineering building was erected in 1925 as an annex of the engineering building; and in 1926 an arts building was erected at a cost of \$750,000. Changes in curriculum during the period under review included. The lengthening of the course in the school of commerce from three to four years in 1923; the requirement of two pre-medical years in the Faculty of Arts for entrance to the Faculty of Medicine, where the course is one of five years, inaugurated in 1924; and the further introduction in 1925 of the two years of college work requirement in the schools of law and dentistry; and at the commencement of the 1927-28 session, one year of college work as a requirement for entrance to the school of applied science. Sir Arthur Currie, G.C.M.G., K.C.B., LL.D., succeeded Sir William Peterson, G.C.M.G., K.C.B., LL.D., D.Litt., as president in 1920.

McGLACHLIN, EDWARD FENTON (1868-). An American soldier, born in Fond du Lac, Wis. He was graduated from the United States Military Academy in 1889 and commissioned in the artillery. Promoted to be colonel in 1916, he was made brigadier general of the National Army in 1917 and in 1918 major general. He served in the Philippine campaigns and from 1914 to 1916 was commandant of the School of Fire for Field Artillery. In 1917 he was appointed commander of the 165th Field Artillery Brigade and later commanded several other brigades. He was made chief of artillery of the 1st Army Corps in 1918 and commander of army artillery and chief of artillery of the 1st Army in the same year. From November,

1918, to September, 1919, he was commander of the 1st Division, and from 1919 to 1921, he commanded the 7th Division. From 1921 to 1923, he was commandant of the Army War College. He became a major general of the Regular Army in 1922 and was retired in the following year. He contributed many articles to army periodicals.

MACGOWAN, KENNETH (1888-). An American author, born at Winthrop, Mass., and educated at Harvard. He was editor of *The Theatre Arts Magazine* (1919-25), dramatic critic for *Vogue* (1920-24), and directed the Provincetown Players, 1924-25, the Greenwich Village Theatre, 1925-27, and the Actors' Theatre in 1927. He produced *All God's Chillun Got Wings*; *Desire Under the Elms*; and other popular plays. Previously he had been dramatic, literary, and photoplay critic for the *Philadelphia Evening Ledger* (1914-17), *New York Tribune* (1918), and *New York Globe* (1919-23). His books on the theatre are *The Theatre of To-Morrow* (1921); *Continental Stagecraft* (1922); and *Masks and Demons* (1923).

McGRAW, JOHN J. (1873-). An American professional baseball player and manager, born at Truxton, N. Y. He was with the Olean Club in 1890, Cedar Rapids in 1891, and Baltimore, 1891 to 1899, becoming manager in the last-named year. In 1900 he played with the St. Louis National League team and managed the Baltimore American League Club in 1901 and 1902. Since 1902 he has been manager of the New York National League team, familiarly known as the "Giants," winning pennants in 1904, 1905, 1911, 1912, 1913, 1917, 1921, 1922, 1923, and 1924, and world's championships in 1905, 1921, and 1922, a record of achievement attained by no other big league manager.

McGREGOR, JAMES HOWARD (1872-). An American zoologist, born at Bellaire, Ohio. He was educated at Ohio State and at Columbia universities. He was assistant in zoology at Ohio State University (1894-95). In 1897 he went to Columbia University, becoming associate professor (1914-24), and professor of zoology in 1924. He published articles on vertebrate morphology and paleontology and modeled an important series of reproductions of heads of types of primitive man.

MACHADO, BERNARDINO (1851-). A former President of Portugal, born in Rio de Janeiro. Elected a representative in Parliament in 1882, he became Minister of Public Works in 1893. He played a leading part in the establishment of the Portuguese Republic and in 1916 was elected President. He was again President for a short time in 1926, but was forced to flee to Paris, where he remained the leader of a group of political refugees seeking the overthrow of the government.

MACHADO de MORALES, GERARDO (1873-). A President of Cuba, born in Santa Clara and educated in the schools of that city. As a young man, he joined the revolutionary forces of General Juan B. Zayas and rose to the rank of brigadier-general in the Cuban war for independence. Later, he served successively as Mayor of Santa Clara, inspector general of the army, and Secretary of Interior. He was elected President by the Liberal Party over General Menocal in November, 1924, and was reelected without opposition in 1928. The constitution was altered during his first term as President,

extending the term of this office to six years. His administration was marked by improvement in the economic condition and the road system of the country, the forcible suppression of Communist propaganda, and the intensification of the agitation for the repeal of the Platt Amendment. See CUBA.

MACHAR, JOSEPH SVATOPLUK (1864-). A Czech poet and essayist, born at Kolin. He was a bank official in Vienna from 1891 to 1918—his most productive literary period. His works, which are satirical, pro-Socialistic, and anti-clerical, include *Confiteor*, a poetical trilogy (1887-92); *Sonette*, poem (1891-93); *Tristium Vindobona* (1893); *Die Streiter Gottes* (1898); *Golgotha* (1899); *Magdalena* (1904); *Im Strahl hellenischer Sonne* (1906); *Rom* (1907); *Das Gift aus Judaea* (1907); *Katholische Erzählungen* (1911); and *Heidnische Flammen* (1912).

MACHEN, ARTHUR (1863-). An English writer. His early books include *The Chronicle of Clemency*, *The Great God Pan*; *The Three Impostors*, *The Hall of Dreams*, which acquired considerable vogue both in England and the United States. His later publications included *The Great Return* (1915), *The Secret Glory* (1922); *Far-Off Things* (1922); *Things Near and Far* (1923). *Ornaments in Jade* (1924); *The London Adventure: an Essay in Wandering* (1924), *The Cunning Wonder* (1925); and *Dreads and Drolls* (1926).

MACHINE GUN ORGANIZATION. See ARMIES AND ARMY ORGANIZATION

MACHINE GUNS. See ORDNANCE; SMALL ARMS.

McINTYRE, FRANK (1865-). An American military officer, born at Montgomery, Ala., and educated at the United States Military Academy. He entered the United States Army as second lieutenant in the 19th Infantry, serving in various ranks until he attained that of brigadier general in 1912. Meanwhile, he saw duty on the Mexican border, in the War with Spain, in the Philippines (1899-1902) and with the general staff (1902-04). He was attached to the Bureau of Insular Affairs in 1905, became its chief in 1912, and again in 1920. During the World War, he was assistant chief of staff with the rank of major general.

MACKAIL, JOHN WILLIAM (1859-). A British classicist (see VOL. XIV). He was president of the Classical Association in 1922-23. Among his more recent publications are *Life of George Wyndham* (1925), *Classical Studies* (1925); *J. L. Strachan Davidson—a Memoir* (1926), and *Studies of English Poets* (1926).

McKEE, RALPH HARPER (1874-). An American chemist, born at Clinton, Mo., and educated at Wooster and Chicago universities. During 1901-09 he was professor of chemistry at Lake Forest, and during 1909-16 he held a similar chair at the University of Maine; in 1917 he became professor of chemical engineering at Columbia. In New York, Professor McKee was consultant to various chemical corporations. During the World War, he was director of the United States Ordnance School of Explosives.

McKELLAR, KENNETH DOUGLAS (1869-). A United States Senator, who was born at Richmond, Ala., and graduated from the University of Alabama (B.A., 1891; LL.B., 1892). He removed to Memphis, Tenn., was a Democratic Presidential elector in 1904 and a delegate to the Democratic National Convention of 1908.

In 1911 he was elected Representative to Congress to fill an unexpired term and was reelected for two terms (1913-17) to represent the 10th Tennessee District. He was then elected to the U. S. Senate for three terms (1917-35).

McKENNA, Rt. Hon. REGINALD (1863-). An English statesman and financier (see Vol. XIV), a member of the Privy Council. From 1911 to 1915, he served as Home Secretary. In the latter year, he was Chancellor of the Exchequer, and as such introduced a new war loan and brought in the budget of September, 1915, which was recognized as an able attempt to deal with the financial conditions arising out of the World War. He retired from politics to assume the chairmanship of the Midland Bank, Limited in 1919. He was a member of the British-American Debt Fund Commission in 1923. He wrote *Post-War Banking Policy* (1928).

McKENNA, ma-kèn'a, STEPHEN (1888-). A British novelist, who was educated at Westminster and Christ Church, Oxford. He was in the Intelligence Section of the War Trade Intelligence Department during the World War and in 1917 was a member of the Balfour Mission to the United States. His works include *Soma* (1917); *Midas and Son* (1919); *Lady Lalith* (1920); *While I Remember* (1921); *Confessions of a Well-Meaning Woman* (1922); *Vindication* (1923); *An Affair of Honor* (1925); *Saviours of Society* (1926); *The Secretary of State* (1927); *The Unburied Dead* (1928); *The Datchley Inheritance* (1929).

MacKENNAL, SIR BERTRAM (1863-). A British sculptor. He was born at Melbourne, Australia, and received his art training in Paris. His early work attracted attention by its originality, but in recent years he has shown more conformity to British conventions in art. Among his works are the equestrian statue of Edward VII in Trafalgar Square, London, unveiled in 1921; the War Memorial at Islington, statues of Queen Victoria for India, Australia, and Blackburn, the pediment of the new Government Buildings at Westminster, the National Memorial to Gainsborough (1913), and the Memorial Tomb of King Edward VII at St. George's Chapel, Windsor. See SCULPTURE.

McKENNA REPORT. See REPARATIONS.

MACKENSEN, mak'én-zén, AUGUST VON (1849-). A Prussian field marshal, born at Hausleipnitz in Saxony. He was at Danzig commanding the 17th Army Corps when the Crown Prince was sent there to be kept from troublesome political activities. On the eastern front in 1914, he commanded the 9th Army and won engagements with the Russians at Kutno, Lodz, and Lowitz. In 1915 he headed the German troops in western Galicia and later in the same year was made a field marshal. He was the commanding general also of the troops which defeated Serbia and Rumania during 1915 and 1916. After the Armistice in 1918, the French interned him at Neusatz, where he was forced to remain until nearly the end of 1919, although the German government protested vigorously.

MACKENZIE, COMPTON (1883-). A British author (see Vol. XIV), who served with distinction during the World War, and was made an officer of the Order of the British Empire in 1919. His later works include *Guy and Pauline* (1915), published as *Plasher's Mead* in the United States; *Sylvia Scarlett* (1918); *Poor Relations* (1919); *Columbina*, a play (1920); *Rich Relatives* (1921); *The Parson's Progress* (1923);

The Heavenly Ladder (1924); *The Old Men of the Sea* (1924); *Coral* (1925); *Fairy Gold* (1926); *Rogues and Vagabonds* (1927); *Vestal Fire* (1927); and *Extraordinary Women* (1928).

MACKINTOSH, KENNETH R. (1875-). An American jurist, who was born at Seattle, Wash., studied at the University of Washington, and was graduated from Stanford University (1895). After receiving the degree of LL.B. at Columbia (N. Y.) in 1900, he began the practice of law at Seattle. He was prosecuting attorney of King County (1905-09), judge of the Superior Court of King County (1912-18), associate justice of the Supreme Court of Washington (1918-27), and chief justice since 1927. In May, 1929, President Hoover appointed him a member of the National Law Enforcement Commission.

McLEAN, ANGUS WILTON (1870-). An American governor, born in Robeson County, N. C., and educated in the law department of the University of North Carolina in 1892. He took an active part in State Democratic politics. From 1918 to 1920, he was director of the War Finance Corporation in Washington and was its managing director in 1920-21. In the same year, he served as Assistant Secretary of the Treasury. He was a member of several commissions during the World War. In 1924 he was elected Governor of North Carolina for the term 1925-28.

McLEAN, GEORGE PAYNE (1857-). A United States Senator (see Vol. XIV). He was reelected to the Senate for the two terms, 1917-29, and retired in 1928, before the expiration of his second term.

MACLEOD, JOHN JAMES RICKARD (1876-). A Scotch-American physiologist and Nobel Prize winner, born at Dunkeld, Scotland, and educated at the University of Aberdeen. In 1898 he devoted himself to the study of physiology and in 1903 was called to the chair of physiology at Western Reserve University. He resigned this professorship in 1917 to accept a like chair in the University of Toronto, where he became the senior member of the group of workers who discovered insulin. The Nobel Prize in medicine for 1923 was divided between MacLeod and Banting (qv). He had already published a book on diabetes. In 1928 he left the University of Toronto to become Regius Professor of physiology at the University of Aberdeen. Beginning as a collaborator in small textbooks on physiology and chemistry, he later wrote *Diabetes* (1913), *Physiology and Biochemistry in Modern Medicine* (1918); and *Carbohydrate Metabolism and Insulin* (1926).

McMASTER, WILLIAM HENRY (1877-). A United States Senator, who was born at Ticonic, Iowa, and studied at Beloit College, Wis. Since 1901 he has been engaged in country banking. He was a member of the South Dakota House of Representatives in 1911 and of the South Dakota Senate in 1913-15. He was elected lieutenant governor (1917-19) and governor for the terms 1921-23 and 1923-25. In 1923 he began a successful agitation for a reduction in the price of gasoline. He was elected to the United States Senate as a Republican for the term 1925-31.

MacMILLAN, DONALD BAXTER (1874-). An American explorer. He was born at Provincetown, Mass., was graduated from Bowdoin College (1898), and became principal of the Levi Hall School at North Gorham, Me. (1898-1900),

head of the classical department of Swarthmore (Pa.) Preparatory School (1900-03), and instructor in the Worcester (Mass.) Academy (1903-08). He was a member of the Peary North Polar Expedition of 1908-09 and of the Cabot Labrador party in 1910. In the two following years, he made ethnological researches among the Labrador Eskimos. He led the Crocker Land Expedition in 1913-17 and became professor of anthropology at Bowdoin College. In 1920 he was engaged in the exploration of Hudson Bay. He commanded the Baffin Land Expedition (1921-22), the North Greenland Expedition (1923-24), and the MacMillan Polar Expedition (1925), in which he had the cooperation of the U. S. Navy in the form of an airplane unit directed by Commander Richard E. Byrd. In 1927 he was awarded the Elisha Kane Gold Medal "for daring exploration and scientific researches." In 1927 and 1928, he conducted explorations in Labrador and in 1929 in the Baffin Bay region. He is the author of *Four Years in the White North* (1918, 1925) and *Etah and Beyond* (1927).

MacMONNIES, FREDERICK (WILLIAM) (1863-). An American sculptor (see Vol. XIV). He executed the heroic figure, "Civic Virtue," at the City Hall Fountain in New York (1919). It was the subject of considerable controversy. One of his best-known later works is the memorial of the Battle of Princeton (at Princeton, N. J.), including an equestrian relief of Washington.

MacMURRAY, JOHN VAN ANTWERP (1881-). An American diplomat, who was born at Schenectady, N. Y., and graduated from Princeton (1902). He completed a law course at Columbia (LL.B., 1906) and was admitted to the New York bar. He entered the diplomatic service as secretary of legation and consul general at Bangkok, Siam, in 1907. For three years, he was second secretary of the Embassy to Russia and then returned to the United States, serving first as assistant chief and later as chief of the State Department's Division of Near Eastern Affairs (1911-13). For the next six years, he was secretary of legation at Peking and counselor of the Embassy at Tokyo. In 1919 he was appointed chief of the Division of Far Eastern Affairs at the State Department, Washington. He was one of the assistants at the Conference on Limitation of Armaments in 1921-22 and was observer for the Government at the Chinese-Japanese Shantung negotiations (1921-22). He was appointed Assistant Secretary of State in 1924, and Minister to China in 1925 serving until 1929 when he resigned. He edited *Treaties and Agreements With and Concerning China, 1894-1919* (2 vols., 1921).

McNARY, CHARLES LINZA (1874-). A United States Senator, who was born near Salem, Oreg., and studied under private tutors and at Stanford University. Admitted to the Oregon bar in 1898, he became deputy district attorney for the Third Judicial District of Oregon (1906-13) and justice of the State Supreme Court (1913-15). In 1916-17, he was chairman of the Republican State Central Committee and in 1917 he was appointed U. S. Senator to fill an unexpired term. He was elected for the two succeeding terms (1919-31). He became chairman of the Senate Committee on Agriculture and Forestry and was one of the sponsors of the McNary-Haugen Bill for farm relief.

MacNEIL, HERMON ATKINS (1866-).

An American sculptor (see Vol. XIV). He won the gold medal at the Panama-Pacific International Exposition in 1915. Two years later, he was awarded the medal of honor of the Architectural League in New York. In 1923 he was awarded the Saltus Medal for excellence.

MacNIDER, HANFORD R. (1889-). An American soldier and banker, who was born at Mason City, Iowa, and graduated at Milton (Mass.) Academy and Harvard (1911). He was connected with the First National Bank of Mason City (1911-16) and since 1920 has been president of a local company of investment bankers. He served on the Mexican border with the Iowa National Guard (1916-17) and in the World War was commissioned second lieutenant in the 9th U. S. Infantry where he was promoted through the grades to lieutenant colonel. He resigned from the Army in September, 1919. For his service in the field, he was awarded the D. S. C. with cluster (U. S.), the Croix de Guerre, five citations (French), and the Croce al Merito di Guerra (Italian). He was elected national commander of the American Legion in 1921. He went to the Republican National Convention of 1924 as delegate-at-large from Iowa, and was Assistant Secretary of War from October, 1925, to January, 1928.

McPHERSON, WILLIAM (1864-). An American chemist and university professor. He was born at Xenia, Ohio, and graduated at Ohio State University, where he became a member of the faculty in 1892, attaining a full professorship of chemistry in 1897. Since 1911 he has been dean of the Graduate School in the same institution and in 1924 was acting president. In the World War, he was commissioned major and served as adviser to the trench-warfare section of the Ordnance Department. Later he became a lieutenant colonel in the Chemical Warfare Service. In 1929 he was elected president of the American Chemical Society.

McRAE, JAMES HENRY (1863-). An American soldier, born in Lumber City, Ga. He was graduated from the United States Military Academy in 1886. Commissioned second lieutenant, he rose to the rank of major general in the National Army in 1918, and brigadier general in the Regular Army in 1920, and major general in the Regular Army in 1922. He took part in the Spanish-American War and in the campaigns in the Philippines. In 1917 he commanded the 9th Brigade, 5th Division, and in 1918-19 was commander of the 78th Division, participating in the St. Mihiel and Meuse-Argonne operations. In 1921-22 he was assistant chief of staff, he was commandant in 1922-24 of the 5th Corps Area, in 1924-26 of the Philippines Department, in 1926 of the 9th Corps Area, and in 1926-27 of the 2d Corps Area. He retired in 1927. He received decorations from the American and foreign governments.

MacVEAGH, CHARLES (1860-). An American lawyer and diplomat. He was born at West Chester, Pa., and graduated at Harvard. After receiving the degree of LL.B. at Columbia, in 1883, he practiced law in New York City until 1925. After 1901 he was general solicitor and assistant general counsel of the U. S. Steel Corporation and in October, 1925, he was appointed American Ambassador to Japan.

MADAGASCAR. A French island colony off the southeastern coast of Africa. Area, 241,094 square miles; population, census of 1926, 3,621,343, of whom 18,040 were French and 11,359

other non-Malagasy, largely Asiatics. The populations of the chief towns in 1926 were: Antananarivo, the capital, 70,847; Tamatave, 15,022; Diégo Suarez, 8604; Mananjary, 12,013; Fianarantsoa, 11,156. The principal ports are Tamatave (east coast), Majunga (northwest), Diégo Suarez (north), Tuléar (southwest). In 1927 the area under rice was 1,392,425 acres; manioc, 682,925 acres; maize, 213,540 acres; sweet potatoes, 244,825 acres; and coffee, 113,537 acres. Other crops of importance are sugar cane, cacao, and vanilla. Besides these, the export trade embraces raffia, graphite, tanning bark, caoutchouc, tapioca, and gold. The extensive cattle breeding accounts for the importance of the hide industry as well as the appearance of local meat-packing plants. Large factories for preserving and chilling meats are located at Majunga, Diégo Suarez, and other centres. Cattle numbered 7,139,900 in 1925, as compared with 5,320,200 in 1913. Exports for 1913, 1920, 1921, and 1927 were 56,054,377, 235,942,698, 108,308,000, and 375,035,956 francs. Imports for the same years were 46,747,000, 279,694,657, 225,921,000, and 579,860,066 francs. Leading imports are cotton goods, beverages, metals, machinery, and clothing. In 1927, 5914 vessels of 2,554,619 tons entered and 5934 vessels of 2,543,899 tons cleared at Madagascar ports. In 1912, 1,756,764 tons entered. The length of railway line in operation in July, 1927, was 429 miles, of which 324 miles were main line and 105 branch lines. The rolling stock in operation comprised 65 locomotives, 46 passenger cars and 426 freight cars. The railways are supplemented by 693 miles of auxiliary motor-bus services. A good system of metalled roads, 1800 miles long, makes communication between the various centres easy. The 1927 budget totaled 289,991,138 francs, as compared with the 1911 budget of 31,153,000 francs. By Jan. 1, 1928, the public debt had mounted to £4,200,000. The colony prospered during and after the War, and work on internal improvements has gone on steadily.

MADARIAGA, SALVADOR DE (1886-). A Spanish critic, essayist, poet, novelist, and publicist, born at Coruña. Educated in Madrid and Paris, he was a journalist and literary critic in London (1916-21) and then became affiliated with the League of Nations Secretariat at Geneva, as a member of the Press Section (1921-22), director of the Disarmament Section (1922-27), secretary of the Third (Disarmament) Commission of the League Assembly (1922-27). He lectured in the United States from 1927 to 1928, when he was called to the chair of Spanish studies at Oxford University. His works include *Shelley and Calderon*, essays (1920); *Spanish Folksong* (1922); *The Genius of Spain* (1923); *The Sacred Graffe* (1926); *Englishmen, Frenchmen, Spaniards* (1928); and other publications in Spanish and French.

MADÉLIN, Louis (1871-). A French historian who was born at Neufchâteau (Vosges), educated at the Collège Fénélon at Bar-le-Duc, the University at Nancy, and the École des Chartes. He was a member of the French School in Rome, was chargé of a course at the Sorbonne (1905-1910), and lectured in the United States and Canada for the Alliance Française in 1907-08. During the World War, he was on the general staff. His writings include *Fouché* (1901); *La Rome de Napoléon* (1903); and *La révolution* (1910), all crowned with Academy

prizes; *Croquis lorrains* (1905); *France et Rome* (1911); *Danton* (1912, trans. 1921); *La bataille de France* (1919); *Les Heures merveilleuses d'Alsace et de Lorraine* (1920); *Le Chemin de la Victoire* (1920, 2 vols.); *L'Expansion française* (1921); *La France du directoire* (1922) and *La France de l'Empire* (1926), two series of lectures; *Le maréchal Foch* (1925); and *Les Hommes de la révolution* (1928). In 1927 he was elected to the French Academy.

MADRID. The capital and largest city of Spain. The population in 1927 was estimated to be 808,366, having increased from 751,352 in 1920. Since the World War, Madrid has advanced materially in an effort to keep abreast of its growing population. Older streets and buildings have been demolished to make way for modern thoroughfares, such as the Gran Vía, and for the erection of shops, hotels, and commercial buildings. The Calle de Alcalá is flanked almost its entire length by new palatial buildings, the most prominent of which are the terraced structure of the Compañía Telefónica de España and the 16-story building erected by *La Prensa*, Madrid's leading newspaper. Many beautiful homes also have been erected in the Castellana, the city's most fashionable residential section, and model tenements are being constructed in great numbers to provide proper housing conditions for the poorer element. The years 1924-26 each witnessed the construction of more than 1000 buildings.

In October, 1919, the first underground electric railway in Spain was inaugurated at Madrid. It covered a distance of three miles. During the first 10 years of its existence, it showed sufficient profits to attract enough capital to extend its scope. The extension which was added in 1920 made the total length six miles. The University of Madrid, which had hitherto been scattered throughout the city, is being centralized by the construction of new buildings on government land in the district of Moncloa. The construction includes class buildings, laboratories, libraries, dormitories, a clinic and hospital, gymnasias, and a stadium. The idea was inspired by King Alfonso, who desired to leave a worthy living monument of his reign.

MAETERLINCK, ma'tér-link or mà'tér'lân' (Fr. pron.) **MAURICE** (1862-). A Belgian poet (see VOL. XIV). During the World War, he did relief work in France and Belgium and wrote in opposition to the German rule in Belgium. His later books included *The Wrack of the Storm* (1916), *The Betrothal* (1918); *The Burgomaster of Stilemonde* (1918), *Les Sentiers dans la Montagne* (1919); *L'Intelligence des fleurs* (1921); *La grande énigme* (1924); *The Great Secret*, *The Life of the White Ant* (1926), and *The Life of Space*, essays (1928). He visited the United States in 1921, with the intention of lecturing in various cities, but his lack of acquaintance with the English language led to the abandonment of this enterprise. Consult *Maeterlinck's Symbolism*, by H. Rose (1921).

MAGNESIUM. See CHEMISTRY.

MAGNETISM. See PHYSICS.

MAINE. Maine is the thirty-eighth State in size (33,040 square miles) and the thirty-fifth in population; capital, Augusta. The population increased from 742,371 in 1910 to 768,014 in 1920, a gain of 3.5 per cent; estimated population, 1928, 795,000. The white population rose from 730,995 (1910) to 765,695 (1920), the native white, from 629,862 to 658,346. The

number of Negroes decreased from 1363 to 1310; of foreign-born whites, from 110,133 to 107,349. The urban population mounted from 262,248 to 299,569, while the rural population fell from 480,123 to 468,445. The growth of the principal cities was as follows: Portland (1910), 58,571 to (1920) 69,272; Lewiston, 26,247 to 31,791; Bangor, 24,803 to 25,978.

Agriculture. Maine is one of the New England States in which there was only slight decline in the percentage of the rural population, 64.7 in 1910 to 61 in 1920. Subsequently, the number of farms increased 3.7 per cent, or from 48,227 in 1920 to 50,033 in 1925; the acreage of land in farms nevertheless decreased from 5,425,968 to 5,161,428. The improved land in farms totaled 1,977,329 acres in 1920. Crop land acreage (1925) was 1,643,515. The total value of farm property rose from \$199,271,998 in 1910 to \$270,526,733 in 1920, and then declined moderately to \$197,269,810 in 1925; the average value per farm was \$3320 in 1910, \$5609 in 1920, and \$4914 in 1925. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. The total percentage of land used for agricultural purposes decreased from 32.9 in 1910 to 28.4 in 1920 and to 27 in 1927. Of the total number of farms in 1925, 47,984 were operated by owners; 350, by managers, and 1699, by tenants. The comparative figures for 1910 are 56,454; 999, and 2563. White farmers in 1920 numbered 48,214, as compared with 59,987 in 1910; foreign-born farmers, chiefly Canadians, numbered 4384, compared with 4973. Farms reported as under mortgage numbered 13,023 in 1920 and 11,925 in 1925. The number of dairy cows in 1920 was 217,021; 151,277 in 1925. "beef" cows, 9956 in 1920 and 6983 in 1925; sheep, 119,471 in 1920 and 84,680 in 1925. There was a noticeable increase in dairying up to 1920, later it was somewhat checked. The growing of potatoes for seed had become a large industry. The estimated production of the chief farm crops in 1928 was as follows: Corn, 520,000 bushels; oats, 4,200,000; potatoes, 37,840,000; and hay, 1,597,000 tons. Comparative figures for 1913 are corn, 608,000 bushels; oats, 5,600,000; potatoes, 28,160,000; and hay, 1,194,000 tons.

Manufactures. While Maine is not one of the most important industrial States, it has manufacturing interests of great importance.

Education. In the course of recent years, there has been marked improvement in educational conditions in the State. Special attention is given to the needs of rural communities. The Legislature enacted in 1919 provision for rotation agricultural schools under the supervision of the State Board for Vocational Education, the Industrial Education Act was amended to provide for a programme of Americanization, a rural teaching provision was virtually established, which is said by experts in education to be one of the most direct approaches to the rural-school problem yet presented; and a State-wide compulsory physical education law and an act reorganizing the law affecting the schools in unorganized territory were passed. Subsequently came the establishment of the State school fund, to be distributed on the basis of teaching positions, aggregate daily attendance, and school census, approximately one-third each, and the establishment of a special school for the training of rural leaders. Consolida-

tion of schools is gradually taking place. By an act of the Legislature of 1923, all towns were required to have their buildings in a sanitary and satisfactory condition by 1927. In 1914 the total enrollment was 146,620; in the year 1925-26 it was 148,596, of whom 121,534 were enrolled in elementary schools and 27,062 in secondary schools. Expenditure in 1925-26 for public day schools was: current, \$9,114,484; outlays, \$1,128,920. The percentage of illiteracy in the State decreased from 4.7 in 1910 to 3.9 in 1920; among the native whites from 1.5 to 1.3 per cent; among the foreign-born whites, from 14.5 to 12.0; and among the Negroes, from 10.3 to 6.8 per cent.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$11,133,604 (of which \$2,179,063 was aid to local education); for conducting public-service enterprises, \$142,802; for interest on debt, \$826,208; for permanent improvements, \$8,006,992; total, \$20,109,606 (of which \$10,396,000 was for highways, \$2,677,875 being for maintenance and \$7,718,125 for construction. Revenues were \$17,419,442. Of this, property and special taxes formed 39.4 per cent; departmental earnings and charges for officials' services, 7.9 per cent, sales of licenses and the tax of gasoline, 42.9 per cent. Property valuation was \$724,938,295; State taxation thereon, \$4,879,722. Net State funded debt on June 30, 1927, was \$21,567,699.

Political and Other Events. The death of Senator Edwin C. Burleigh on June 16, 1916, made two Senate elections necessary. Carl E. Milliken was elected governor and Frederick Hale and Bert M. Fernald were elected senators. In the presidential election in November, 1916, Charles E. Hughes received 69,506 votes; President Wilson, 64,118. The first national park east of the Mississippi, comprising 5000 acres, was created at Mt. Desert Island, in July, 1916. On Sept. 10, 1917, a woman-suffrage amendment was defeated. A budget system was inaugurated in this year. In 1918 Carl E. Milliken was re-elected governor, and Senator Fernald was re-elected to the Senate. The Republicans also elected a large majority of the members of the Legislature. In the presidential voting of 1920, W. G. Harding received 136,355 votes; J. M. Cox, 58,961. In 1920 Frederick H. Parkhurst, Republican, was elected governor. Governor Parkhurst died on Jan. 31, 1921, 24 days after he had taken the oath of office, and was succeeded as governor by Percival P. Baxter, President of the Senate. In 1922 Governor Baxter was re-elected, and Senator Hale was re-elected to the Senate. The State's presidential vote in 1924 was: Coolidge, 138,440; Davis, 41,964; R. O. Brewster, Republican, was elected governor. A referendum proposal to repeal the direct primary was lost in 1927. William Tudor Gardiner, Republican, was elected governor in 1928; the vote for President was: Hoover, 179,923; Smith, 81,179.

Legislation. The Legislature of 1914 amended the workmen's-compensation law. A woman-suffrage measure failed by a narrow margin to pass the House of Representatives. The liquor laws were amended in 1917. The Legislature in 1919 made provision for the voting of women for President and passed a measure providing for the registration of persons employed as counsel or agents to promote or oppose

legislation. The Legislature of 1921 passed measures regulating the use of aircraft, extended the jurisdiction of the Public Utilities Commission over certain motor vehicles, amended the State Prohibition Law to harmonize with the Federal law, provided a bonus to soldiers and sailors who fought in the War with Spain, and amended the workmen's-compensation law. In 1923 the Legislature passed a bill to facilitate coöperative marketing of agricultural products and made it criminal conspiracy for two or more persons to conspire to sell liquor in violation of the law. In this period was developed a policy of improved highways, and bonds to the amount of \$9,000,000 had been authorized and issued, under public referendum. In 1923 the State refused, by public referendum, to institute a 48-hour law for women and minors. The majority opposed was over 20,000. The State water-power policy instituted by Fernald, prohibiting transmission of hydroelectric power beyond the borders of Maine, was constantly under fire but was not changed in this period. Successive acts raised the gasoline-tax rate to four cents a gallon in 1927. A measure of 1927 admitted the State to the terms of the Federal Maternity and Infancy Act.

MAINE, UNIVERSITY OF. A State institution of higher learning for men and women, at Orono, Me., founded in 1865. The enrollment for the period 1914-28 grew from 1058 to 1390, with a summer session registration of 315 in the latter year. The faculty was increased from 126 to 224, divided as follows in 1928: Teaching and administration, 150; agricultural extension service, 48, experiment station, 26. The library was increased from 40,000 to 87,799 volumes. The productive funds amounted to \$866,823, and the income to \$933,349, in 1928, as compared with an income of \$642,756 in 1923-24. A department of music was established in 1916; a new building for the college of arts and sciences, for which funds were provided by the State Legislature, was ready for occupancy in the autumn of 1924; several units of a gymnasium-armory, to cost \$500,000, were provided for in 1925 by gifts from alumni, as a memorial to Maine men killed in the World War, in the following year, a laboratory for mechanical engineering, a gift of the late Oliver Crosby of the class of '76, to be known as the Crosby Memorial Laboratory, was under construction; and a building to provide for laboratory instruction in dairy husbandry was completed in 1927. In 1928 Rogers Hall, for dairy manufactures, named for Dr. Lore A. Rogers, '96, bacteriologist of Washington, D. C., was occupied, and a horticultural building was nearing completion. President, Harold Sherburne Boardman, C.E., D. Eng., LL.D., acting president, from 1925, was inaugurated in 1926.

MALACCA. See STRAITS SETTLEMENTS.

MALARIA. The World War caused malaria to be carried to Great Britain and France after long years of immunity, and drove home strongly the fact that it is still the world scourge which nullifies the efforts of man to civilize certain of the world's areas. The successful campaign against malaria in the temperate zones will not be repeated in the tropics until our knowledge of the disease has been increased. Quinine is powerless against certain types of tropical malaria; while the *anopheles* mosquito, which can be made the object of an intensive campaign of eradication in the United States, is not the sole

means of distribution of the plasmodium in the tropics. Other insects are doubtless involved, of whose life cycle and habits little is known.

In Saloniki during the War, the disease behaved like tropical malaria, and not more than 20 per cent of the men responded to quinine; in this case, the infection probably proceeded from Egypt and could be classed as tropical. In regard to malaria in the United States, the work of the Rockefeller Foundation appears to show that the control of the disease is a matter simply of money and engineering. It is true that in rural sections the cost would be prohibitive and that systematic use of quinine must be added. This drug should be given in childhood and youth, for malaria is but infrequently contracted after this period.

There was held in Rome, during Oct. 3-6, 1928, the first International Malaria Congress, which was opened officially by Premier Mussolini. The first subject to be discussed was that of the unity or duality of the malarial parasite. The unicists, who follow the lead of Laveran, the French discoverer of the *plasmodium malariae*, were once in the ascendant but are now heavily outnumbered by the pluralists—to such an extent, in fact, that the delegates were almost unanimous. Different species of the parasite account for the great differences in the clinical course and explain why we have a benign and a malignant malaria.

MALAY STATES, FEDERATED. A federation of native States in the Malay Peninsula under British protection. The territory, made up of Perak, Selangor, Negri Sembilan, and Pahang, had an area of 27,506 square miles in 1921 and a population of 1,324,890. The 1911 population was 1,036,999. The 1921 population was composed of 510,821 Malays, 494,548 Chinese, 305,219 British Indians (172,465 in 1911), 5686 Europeans, and 3204 Eurasians. The estimated population in June, 1926, was 1,476,032. The chief town, Kuala Lumpur, has an estimated population of 80,000. Indian laborers continue to predominate on the estates. The leading activities centre in the rubber and tin industries. Coconuts, rice, sugar, tapioca, pepper, and gambier are also cultivated. The country was little touched by the War and the succeeding depression. Exports for 1927 totaled £39,619,922; imports, £20,309,979. Leading imports in 1927 were rice, machinery, cigarettes and tobacco, kerosene and motor oils, and cotton goods. The principal exports were rubber, tin ore, tin, and copra. In 1927, 10,677 vessels, exclusive of native craft, of 7,027,914 tons entered and cleared ports of the Federated Malay States. Government accounts for 1927 were: revenues, £12,297,187; expenditures, £10,880,790. The public debt on Dec. 31, 1927, was £9,355,000. In 1927 there were 1105 miles of railway in operation, compared with 614 miles in 1912. The government scheme calls for a network of railways over the whole peninsula and in 1927 about 81 miles of line were under construction.

MALAY STATES, NONFEDERATED. Five Malay States not included in the Federation. These are (1) *Johore*, with an area of 7678 square miles and a population of 309,293. The State greatly increased in population after 1911 and also progressed economically. Rubber, tin, and copra are the leading exports. Exports in 1921 and 1927 were Straits \$32,029,128 and \$88,317,154; imports were Straits \$24,730,135 and \$39,422,852. The government expenditure

for 1927 was Straits \$15,848,473; revenue, \$18,239,023. (2) *Kedah* has an area of 3800 square miles and a population of 338,554. Chief articles of commerce are rice, rubber, coconut, tapioca. The tin mines are rapidly being exhausted. Exports in 1927-28 were \$28,509,759; imports, \$9,280,175. Government expenditure for 1927 was Straits \$7,335,338; revenue, \$7,722,507. (3) *Pelis* has an area of 316 square miles, and a population of 40,091. Leading products are rice, tin, and guano; the last two were declining. (4) *Kelantan* has an area of 5713 square miles and a population of 309,293. Agriculture is the leading activity; rice, rubber, and coconut raising ranking highest in importance. Rubber is the chief article of commerce. Exports in 1927 were Straits \$9,021,746; imports were \$6,530,025. Valuable mining concessions, said to contain gold, galena, pyrites, and tin, are owned by British companies. State expenditures in 1927 amounted to \$2,949,438, revenue, \$2,448,090. (5) *Tengganu* has an area of 5500 square miles and a population of 153,092. Industries are similar to those of Kelantan. Exports in 1927 were Straits \$8,244,479; imports, \$6,064,758. State expenditures for 1927 were \$1,542,404; revenues, \$1,402,550. Tin and wolfram mines are worked. All the States have native sultans at whose courts reside British advisers representing Great Britain.

MALIPIERO, FRANCESCO (1882-). An Italian composer, born at Venice. Although he began to study the violin at the age of six, his instruction was very desultory. Not until 1899 did he begin to study with interest and systematically at the Liceo Musicale in Venice, under Enrico Bossi, whom he followed to Bologna (1902) on his becoming director of the Liceo there. After completing his studies, Malipiero devoted himself entirely to composition. At different times, he lived in Venice, Rome, Paris, and Asolo. In 1924 he became director of the Liceo Musicale in Florence. His earliest compositions were influenced by Wagner, but these he himself destroyed. He adopted the principles of futurism, of which he is one of the leading exponents. Of his operas, *Elan e Fuldano*; *Canossa*; *Il Sogno d'un Tramonto d'Autunno*; *Pantea*; a trilogy, *L'Orfeide (La Morte delle Maschere, Sette Canzoni, and Orfeo)*; *San Francisco d'Assisi*; *Filomela e l'Infatuato*, only four were produced (but only in the cities indicated), *Canossa* (Rome, 1914); *Sette Canzoni* (Paris, 1920); *Orfeo* (Dusseldorf, 1925), and *Sior Todero Brontolon* (Monte Carlo, 1928). In the matter of mechanical stage-effects, Malipiero's demands are so extravagant as to constitute an effective barrier against the performance of those operas. A ballet, *La Mascarade des Princesses captives*, was produced in Brussels (1924). For orchestra, he wrote *Dai Scopolari*; *Dalle Alpi*; *Sinfonia delle Eroi*; *Sinfonia del Mare*, *Impressioni dal Vero* (two series; *Pause del Silenzio*; *Ditrambo Tragico*; *Illustrazioni di un Poema Cavalleresco*; *Armenia*; *Sinfonia del Silenzio e della Morte*; *Oriente immaginario*, and *La Cimmarosiana*. His *Ruspetti e Strambotti* for string quartet won the Berkshire Prize (1920). He also wrote piano numbers.

MALMÉDY. See EUPEN, MALMÉDY, AND MORENET.

MALTA. A British island colony in the Mediterranean Sea. The total area of Malta and its two islet dependencies is 122 square miles; civil population in 1921, 213,024; esti-

mated in 1927, 227,440. Agriculture is the chief activity. Leading products are wheat, barley, vegetables, grapes and other fruits, and cotton. Trade (excluding goods in transit) for 1913-14 and 1927 totaled £1,154,363 and £1,006,881 in exports, and £2,589,272 and £4,285,436 in imports. The State budget increased over the period 1913-28 from £423,108 in revenues and £402,521 for expenditures (1913-14) to £823,138 and £887,523 (1926-27). In 1921 a Maltese constitution was promulgated for the purpose of giving the natives a responsible government. A bicameral house was provided with its own local ministry. Certain "reserved" matters, however, including control of naval, military, and air forces, imperial interests, external trade, immigration, and treaties, were to be controlled by the governor and a nominated council. Valletta, the chief town, continues as an important port of call and the headquarters for the British Mediterranean fleet.

MALTA FEVER. This acute infectious disease known under a variety of names of which undulant fever is one of the best known was at first recognized only in the Mediterranean Basin of Europe as a malady largely transmissible by milk, in particular, goats' milk. Its incidence, however, was evidently much greater, for in 1913 its existence was first recognized in the United States, and in 1918 Dr. Alice Evans of the U. S. Public Health Service was able to show that the causal agent was identical with that of infectious abortion in domestic animals. This common origin of a human and animal disease has been recognized in several different parts of the world, as Italy, the Near East, and South Africa. It is extremely probable that many cases masquerading as typhoid which give a negative Widal reaction have been examples of Malta fever. Recently, the problem of Malta fever has become much complicated because different strains of the causal organism have been isolated which seem to be pathogenic only for certain animals. Thus, infectious abortion in cattle does not seem very dangerous to mankind, although occasionally a connection may be traced; and it has been suggested that unexplained abortion in women may be traced to this source although, in human Malta fever, abortion plays no greater rôle than in any other febrile affection. The number of human cases in the United States increased from 24 in 1925 to 649 in 1928. See VETERINARY MEDICINE.

MAN, ANCIENT. See ANTHROPOLOGY.

MAN, ISLE OF. See GREAT BRITAIN.

MAN, PREHISTORIC RACES OF. There is now no general disagreement concerning man's relation to the anthropoid apes, but the many finds of fossil forms intermediate to man and the apes made during the period 1914-28 have raised questions of the precise nature of that relationship.

It is commonly held that monkeys, apes, and man are derived from a generalized tarsoid (lemur-like creature) of Eocene times, estimated at four million years ago. The developing brain and eye played leading parts in this evolution, according to Elliot Smith (*The Evolution of Man*, 1924). By Miocene times (two million years ago), a host of anthropoids or man-like apes had appeared, whose fossil remains have been found from Europe to India. Gregory and Hellman hold that man and at least three of the living anthropoids (gorilla, chimpanzee, and

orangutan) derive common descent from one of these Miocene types, *Dryopithecus*; that, in fact, it is possible to fix on one particular species, *D. rhenanus* (*Anthropological Papers, American Museum of Natural History*, 28, 1926). This view is based especially on a comparison of the forms of their teeth, but is substantiated by other features.

H. F. Osborn maintained on the contrary that the point of departure is more remote, in Eocene times or the early part of the succeeding epoch, Oligocene. He postulated a Dawn Man of that period, wholly dissociated from the anthropoids, and with all subsequent development increasingly divergent (*Science*, 1927, 481). His view was dictated in part by an effort to prove that man's ancestry and the ape's have been separate over a long period. Particular evidence for it rested, in part, on a supposed anthropoid tooth from the Pliocene of Nebraska. W. K. Gregory showed, however, that Osborn had drawn a false analogy from the early separation and parallel development of horses, camels, and related forms. He conclusively demonstrated that the anthropoid forms and man were highly variable, approaching and diverging at many points in their career (*Science*, 1927, 601).

The place of man's origin would seem to be in the great forest that covered the central part of the Old World land-mass in Miocene times, in the remnants of which the anthropoids now live (Congo, Malay Archipelago). The discovery of Pittdown man in the early Pleistocene (Ice Age, the last million years) of England has led Hrdlička, Hooton, and others to consider the possibility of a European or an African origin. Others still look to Asia, partly because of the fossil anthropoids of India and the semi-human *Pithecanthropus* of Java: Mendes-Correa suggests the borders of the Indian Ocean (*Scientia*, 1927); Matthew, central Asia. At least America is definitely excluded by Gregory's determination that the molar tooth of the supposed anthropoid *Hesperopithecus* of the Nebraska Pliocene (the epoch preceding the Ice Age) is that of a fossil peccary (*Science*, 1928, 597).

No new finds of *Pithecanthropus erectus* have been made, but in 1926 J. G. Andersson announced the discovery of molar and pre-molar teeth near Peking in deposits of the same age as *Pithecanthropus* (upper Pliocene or lower Pleistocene). How far these are homoid remains to be seen. While the original *Pithecanthropus* remains were found in 1891, it was only in 1923 that it became known that Dubois had found at the same time part of the lower jaw of another individual, but apparently belonging to the same genus. The net result of this new information is to give added certainty to the existence of this genus.

There is still considerable dispute as to the Pittdown remains, discovered in 1912. The skull is incomplete: part of the brain case, portions of the face, some teeth, and half of a lower jaw. These were not found in immediate association. A reconstruction of the skull fragments shows a decidedly modern type with a high skull capacity. The jaw and teeth, however, are ape-like in appearance and distinctly at variance with the skull. Non-British students were strongly inclined to view the jaw as that of a chimpanzee (although fossil anthropoids were hitherto unknown in England) and unconnected with the distinctly human skull.

New discoveries of skull and teeth, reported in 1924, confirmed the strange association. A radiographic study of the tooth-cavity shows the characteristics of modern man, Heidelberg and Neanderthal types, not those of the apes (Mac Curdy, *Scientific Monthly*, 1924). The geological position is still uncertain, but on the basis of its low development, Pittdown is assigned to the lower Pleistocene by some, to the third interglacial period (late Pleistocene) by others.

A series of remains of Neanderthal man (late Pleistocene), with whom is associated Mousterian culture, have been found since the World War in several parts of Europe and as far east as Palestine. Doubt no longer remains as to the identity of this homoid species. Prevailing opinion is that this type, as well as *Homo sapiens* (modern man), was derived from *Homo Heidelbergensis* of early or middle Pleistocene age. A child's cranium of Neanderthal type, found at La Quina, differs so much from that of a modern child as to suggest that the point of separation must have been very remote. In 1914 the lower jaw of an adult and an incomplete skeleton were found at Ehringsdorf, near Weimar. While held generally to be Neanderthaloid, it is the opinion of some that these resemble Pittdown and represent a type of a more remote period than Neanderthal. It is now generally believed that the Neanderthal species left no living descendants, although earlier opinion maintained that Australians and Tasmanians presented Neanderthaloid characters, which could even be identified among the peoples of Frisland. Recently, Hrdlička affirmed that *Homo sapiens*, as a whole, was derived from an aberrant type of Neanderthal (*Jour. Royal Anth. Inst.*, 57, 249).

South Africa presented three puzzling forms: that of Boskop, Transvaal, in 1914, Broken Hill, Rhodesia, in 1921, and the Taungs skull, Bechuanaland, in 1925. The antiquity of all three is uncertain. R. Broom, who held the Boskop skull to be of exceedingly primitive character, suggested that it may be ancestral to Neanderthal as well as Clô-Magnon (early *Homo sapiens*), and proposed a new specific name for it, *Homo capensis* (*Anthropological Papers, American Museum of Natural History*, 23, 1918). This find has attracted little attention. The fauna associated with the Broken Hill finds does not indicate great antiquity, but the type is truly ancient. In this case, a large part of the skeleton was found, and fragments from the skeleton of at least one other individual. The brain case is low-vaulted, indicative of low cranial capacity; the large gorilla-like face has the massive brow ridges of Neanderthal; the teeth are large and the jaws massive. On the other hand, the skeleton indicates erect posture and straight legs similar to modern man. Elliot Smith considered it a form of earlier origin than Neanderthal, but persisting in marginal South Africa to a late date. The Taungs skull aroused considerable controversy. R. A. Dart considered this immature specimen as more homoid than any anthropoid, but Keith, Boule, and others held it a fossil anthropoid. On the side of its antiquity, the find is equivocal; R. B. Young maintained that the skull was washed into the fissure in which it was found, and Schwartz that the tropical forest in which the animal lived may have persisted in South Africa until recent date (*Nature*, 1925, 195, 22; *Trans. Geol. Soc. S. Africa*, 28, 55).

The best known of the early forms of our own species (*Homo sapiens*) is the Crô-Magnon race. In the opinion of E. Hooton, the assemblage of skeletons attributed to this race does not represent a true race (*Ancient Inhabitants of the Canary Islands*, 1925), but is an arbitrary group of ancient types, selected because of the large size of the skulls, combining a narrow head with a disproportionately wide face. These, in his view, are hybrids resulting from the crossing of a dolicocephalic (narrow headed) group, having faces of medium width (such as Galley Hill, Brunn), with a broad-faced brachycephalic (broad headed) people (Ofnet, Grenelle). The relation of existing races to this and other Upper Pleistocene races is still uncertain. Caucasians are commonly said to derive from Crô-Magnon and Brunn, Negroids from the Grimaldi race of the same age, but no ancestral Mongoloid types have yet been discovered. No very ancient forms of the American Indian variety of the Mongoloid race have been located, although attributed finds have been frequently reported. The Talgai skull from Queensland was thought to be ancestral to the Australian aborigines, but the remains and their antiquity are too equivocal to warrant that view.

A conservative view of the classification of living races is that of Kroeber (*Anthropology*, 1933), who makes the major groups Caucasian, Mongoloid, and Negroid, leaving the Polynesians, Ainu, Indo-Australians, and Australians unclassified because of doubtful affiliation. Elliot Smith adds the Australians as a fourth and most primitive division, from which Negroids, Mongoloids, and Caucasians range in order as more specialized forms (*Evolution of Man*, 1924). R. B. Dixon makes quite a different analysis (*Racial History of Man*, 1923). Taking three cranial features, cephalic index, height index, and nasal index, he bases a system of races on them alone, to the exclusion of such hitherto universally accepted features as pigmentation and hair texture. Dividing each character into three classes, he has twenty-seven possible groups of which eight are considered primary races. The combination of these in each racial group is then analyzed. While the scheme has the merit of insisting on the complexity of racial amalgamation and the variability of human groups, the results have met with general skepticism. Some progress has also been made in classification by the use of blood-precipitation tests, but the results are not conclusive.

Several local studies deserve notice: F. Sarasin's *Anthropologie der Neu-Caledonier und Loyalty-Insulaner* (1916-1922), Matsumura's "Cephalic Index and Stature of the Japanese" (*Jour. Fac. Sci., Imp Univ. Tokyo*, 1925); Sullivan's "Racial Types in the Philippine Islands" (*Anthro. Papers, Amer., Mus. Nat. Hist.*, 1918), and Dunn's "Anthropometric Study of Hawaiians of Pure and Mixed Blood" (*Papers, Peabody Museum*, 1928).

As to the cause of racial differentiation, Keith suggests the influence of the ductless glands (*Brit. Assn. Adv. Sci.*, 1920). E. Fischer insists on a view often neglected by race classifiers, namely, that man is a domesticated animal and hence has developed variations corresponding to those differentiating races of cattle, etc. (*Zeit. f. Morphologie u. Anthro.*, 18, 1914). The differences in hair form, bone structure, and musculature among living races are precisely of the order of those setting off domestic animals from

wild species. One current explanation for differences in pigment is based on their relative absorption of light; Shaxby and Bonnell found, however, that there is no difference in the reflective properties of Caucasian and Negroid skins (*Man*, 1928, No. 42).

For the purpose of race classification, it has been assumed that such features as head form, hair texture, etc., are fixed by heredity alone; but paralleling Fischer's thought, Boas has investigated the effects of changed environment on physical types. To his earlier demonstration that children of immigrants to the United States differ from their parental types in head form, face width, and stature (*Rept. Immigration Comm.*, 39, 1911), Boas now adds evidence from Porto Rico and elsewhere (*Proc. Nat. Acad. Sci.*, 1916, 713). A summary of such investigations is Boas's "Report on an Anthropometric Investigation of the Population of the United States" (*Jour. Amer. Statistical Assn.*, 1922). F. Sarasin also has discussed the possibility of convergent development of hair form in diverse races (*Anthropologie der Neu-Caledonier*, 1916-1922). Such changes, which imply the possibility of similarities by convergence, render the structure of race classifications exceedingly shaky.

MANCHECOURT. See LAVEDAN, HENRI.

MANCHESTER. An important manufacturing city of England and the centre of the world's cotton trade. The population at the census of 1921 was 730,307; in 1927 it was estimated to be 751,900. The municipal area is 21,690 acres (about 34 square miles). Manchester is the distributing centre of the cotton spinning and weaving industries of Lancashire for the whole world and of butter and foodstuffs for the most densely populated part of England. It also contains large engineering machinery works and factories for the manufacture of silks, chemicals, india-rubber goods, etc. In 1924 the total value of silk fabrics and yarns produced in Great Britain was £5,543,000, of which about £2,131,900 was manufactured in Manchester.

Manchester is the fourth port in the British Isles, being surpassed only by London, Liverpool, and Hull. It has direct access to the sea by means of the Manchester Ship Canal, which has a total length of 35.5 miles. In 1925 this canal was deepened from 28 feet to 30 feet from the entrance locks at Eastham to Ellesmere Port, a distance of about five miles. Increased facilities for handling cargo were also installed at a cost of nearly £500,000. In 1926 the net tonnage of ships engaged in foreign trade was 3,554,667 for arrivals and 3,241,062 for departures. The value of the sea-borne trade of the port was £96,448,534.

The construction of a service reservoir at Heaton Park, which was begun in 1907 and suspended during the period of the World War, was resumed in 1923 and completed in 1927. It has a surface area of 77.5 acres, an average depth of 26 feet, and a capacity of 570,000,000 gallons. At a cost of £6,500,000 the corporation has assured a supply of 50,000,000 gallons of water per day from Lake Thirlmere in Westmoreland, the water being conveyed a distance of 100 miles to the distributing reservoir. An additional supply is obtained from a series of reservoirs in the Longderdale Valley, and with a wise provision for the future needs of this

industrial area, the corporation in 1919 obtained Parliamentary powers to acquire and use Haweswater, also in the Lake District. The daily average distribution for 1927-28 was 55,000,000 gallons.

A new art gallery and museum have been erected in the central part of the city at a cost of £300,000. In front of the building are statues of the Duke of Wellington, John Dalton, Queen Victoria, James Watt, and Sir Robert Peel. The Royal Exchange was reconstructed, 1915 to 1921, with a clock tower 180 feet high. In 1919 a replica of George Gray Barnard's statue of Abraham Lincoln in Cincinnati was erected in Platt's Field Park. Manchester claims to be the birthplace of free public libraries, the first having been opened in 1852. In 1929 the Central Reference Library had 255,218 volumes, exclusive of the foreign, music, and commercial libraries; 25 district libraries are distributed throughout the city.

MANCHURIA, man-chō'rě-ā. A Chinese outer territory, with an approximate area of 363,700 square miles and a population estimated at 24,520,661 in 1927. Immigration from Central China is increasing the population by a million yearly. The capital and chief town, Mukden, has about 350,000 inhabitants; the chief port is Dairen. Other large towns are Harbin (365,000), Newchwang (82,100), Kirin (540,214), Ying K'ou (60,000), and An-tung (72,500). The extraordinary fertility of the soil and the improved railway facilities caused Manchuria to grow more rapidly than any other section of China. In 1927 it was estimated that 81,718,945 acres of land were under cultivation. The soya bean, millet, kaoliang (a sort of sorghum), wheat, and rice are the principal crops. Tobacco, beets, and flax also are grown. Gold, iron, coal, salt, natural soda, and magnesite also are worked to some extent. The constant application of the principal concessionaire in the country, the South Manchuria Railway, to industrial activities has met with excellent results. Principal works are bean mills, flour mills, sugar refineries, distilleries, and iron and steel factories. The trade of Manchuria reflected the same condition. Imports of foreign goods steadily increased from 72,431,345 taels in 1913 to 136,926,411 in 1921; exports from 94,053,423 to 196,820,680 in 1921. The combined export and import trade during the year ended Mar 31, 1928, amounted to 662,000,000 taels. The total railway mileage in 1929 was 3622. See CHINA and JAPAN.

History. Events of the World War, and, in later years, an enormous influx of immigration from China combined to increase both the wealth of Manchuria and the intensity of the international struggle for its possession. The Chinese Eastern Railway, key to the wealth of the province, was taken over by the Allies in 1917. American engineers operated it until 1922, when it was turned over to China. In 1924 the Soviet government secured an agreement for the control of the railroad by a board of directors appointed jointly by the two governments, at the same time pledging itself to refrain from Communistic propaganda in China. Friction developed which came to a head July 10, 1929, when the Nanking government arrested many Russian officials and employees of the railroad and replaced them with Chinese and White Russians. The excuse for this action was that a raid on the Soviet Consulate at Harbin on May 27, preceding, had un-

covered a Communist plot to overthrow the Nationalist government. A Russian ultimatum was ignored; on July 18 the Soviet government severed diplomatic relations, and the threat of war led the United States and other leading powers to intervene on July 19 to the extent of calling the attention of both governments to their obligations under the Kellogg-Briand Pact. While armed forces faced each other across the border and numerous minor clashes were reported, negotiations between the two governments continued into the winter months without a settlement of the dispute.

MANDATES. The decision of the Paris Peace Conference (see PEACE CONFERENCE AND TREATIES) to establish a mandatory system under supervision of the League of Nations instead of permitting the outright annexation of the former German colonies and Turkish territories by the victorious Allies, resulted in the creation of a very significant and novel form of international control over colonial possessions. Colonies with an aggregate area about 1,250,000 square miles and a total population of more than 15,000,000 were placed under mandates of the League of Nations. Article 22 of the Covenant which was prefaced to the five major peace treaties provided that certain territories taken from the defeated powers and "not yet able to stand by themselves" should be administered by more civilized nations acting as "mandatory" or trustees for the League of Nations, in which, presumably, ultimate sovereignty is vested. There were to be three classes of mandates. Class A, including territories taken from Turkey; Class B, including former German colonies in central Africa, and Class C, comprising German Southwest Africa and the former German island possessions in the Pacific. The principal Allied and Associated Powers, to whom these areas were ceded by Turkey and Germany, reserved the right to distribute the territories in question, and to draft the mandates, before turning the system over to the League for permanent operation. Accordingly, the Supreme Council on May 7 distributed the B and C mandates as follows: German East Africa to Great Britain, Togoland and the Cameroons (qv) to Great Britain and France, Southwest Africa to the Union of South Africa, Samoa to New Zealand, Nauru to the British Empire, German New Guinea to Australia, and German islands north of the equator to Japan.

There remained the A mandates. Because of the uncertainty regarding the Turkish peace settlement, these were not distributed until the San Remo Conference of Premiers in April, 1920. The San Remo decision, confirmed on May 5, allotted Syria to France, and Palestine and Mesopotamia to Great Britain. It had been intended that Armenia also should become an A mandate, but as neither the United States nor any other power cared to assume responsibility for Armenia's welfare, no mandate was issued. See ARMENIA.

As the premiers at San Remo not only assigned the mandates but also sealed a compact for exclusive Anglo-French exploitation of the oil resources in Mesopotamia, the United States government immediately addressed a note of protest, May 12, 1920, to Great Britain, insisting on equal treatment for subjects of all nations. Refusing to be referred by Lord Curzon to the Council of the League (Curzon letter of August 9), the Washington government insisted

on Nov. 20, 1920, that the drafts of mandates must be communicated to it for criticism before final approval, and that the United States had a just claim to all privileges, in regard to mandates, enjoyed by members of the League. The first point, it may be noted, was satisfied subsequently by preliminary publication of draft mandates; the second was guaranteed by special treaties which the United States later negotiated with individual mandatory powers. The United States also objected to the assignment of Yap to Japan, and not until the Washington Conference was this dispute settled by a special treaty recognizing the Japanese mandate for assuring the United States of cable and wireless facilities. See YAP; WASHINGTON CONFERENCE.

Meanwhile, work proceeded on the drafts of the mandates, for each mandated territory was to be entrusted to the mandatory power only on a conditional basis laid down in a separate charter or mandate, drafted by the chief Allied powers, but approved and granted by the League Council. The C mandates, offering the least difficulty, were first formulated and received the Council's stamp of approval on Dec. 17, 1920. These were five in number: Union of South Africa mandate for former German Southwest Africa, Australian mandate for New Guinea, New Zealand mandate for western Samoa, British Empire mandate for Nauru Island, and Japanese mandate for the Caroline and Marshall Islands. In each of these territories, the mandatory power was authorized to exercise full power of administration and legislation, subject to reservations for the prohibition of slavery and forced labor, of the arms and liquor traffic, of fortifications and military training of natives save for local defense, and subject also to a guarantee of religious freedom. Japan would gladly have added a provision for the open door, but the other powers, especially the Australasian Dominions, unwilling to throw their Pacific mandates open to Japan, refused.

Difficulties with the Holy See regarding the Palestine mandate, and with the United States regarding Mesopotamia, delayed the definitive approval of the other mandates. On Aug. 1, 1922, the Council approved B mandates for northern Cameroon (British), southern Cameroon (French), western Togoland (British), eastern Togoland (French), Ruanda and Urundi (Belgian), and East Africa or Tanganyika Territory (British). A notable feature of these mandates was the inclusion of elaborate provisions for the welfare of the natives, the abolition of slavery, and equality of commercial and industrial opportunity in these territories among members of the League, in addition to the stipulations contained in the C mandates. The A mandates for Palestine (British) and Syria and Lebanon (French) were approved on July 24, 1922, and published by the League on August 12; that for Mesopotamia had long been drafted but had aroused so much international difficulty and was so vitally dependent on British relations with the natives that its confirmation was delayed (see IRAQ.) The A mandates were particularly interesting; they were designed to be transitional measures to assist backward countries until fit for independence. Special provisions were inserted for the development of autonomy and for the protection of antiquities or archaeological remains.

All mandates imposed on the mandatory power the obligation to make regular reports of its administration to a Permanent Mandates Commission appointed by the League. This is undoubtedly the most unusual and the most valuable feature of the entire system; the knowledge that such reports will receive full publicity and open discussion has acted as a potent stimulus to good administration.

The Mandates Commission has received criticism at times from the Mandatory Power for its excess of zeal in securing information. In February, 1926, the administration of the mandate over Syria by France came before the League of Nations due to criticisms by the representatives of the people of Syria. In 1927 the Mandates Commission considered a number of minor items including the relations of the Union of South Africa to the Southwest Protectorate, involving the definition of the term "possess sovereignty." This subject continued to be discussed in the following year and a report was adopted by the Council aiming to clarify the situation calling attention as it did to conditions new to international law which had developed in the relations of mandated territory to the mandatory powers and to the League of Nations itself.

Full information regarding the mandates and their administration is made available by the League of Nations in its publications containing minutes of the Mandates Commission and supplementary official documents. See AFRICA; LEAGUE OF NATIONS.

MANÉN, mà-nân'. JUAN (1883-). A Spanish violinist and composer (see VOL. XIV). He added to the list of his works. The operas, *Der Weg zur Sonne* (Brunswick, 1926), and *Nero und Acté* (Karlsruhe, 1928); a symphonic poem, *Nueva Cataluna*; two violin concertos, a piano concerto; *Variations* on a theme of Paganini for violin and orchestra, *Suite* for piano and violin with orchestra; *Concerto grosso* for two violins and orchestra; a piano quartet, a string quartet; a piano quintet. He also published numerous transcriptions for violin and edited the works of Paganini.

MANGIN, mân'zhân, CHARLES MARIE EMANUEL (1866-1925). A French soldier, born in Sarrebourg, Meurthe. He served on the staff of Marchand's Fashoda mission in 1897 and played a prominent part in the conquest of Morocco from 1911 to 1913, in the latter year being made brigadier general. In the World War, he commanded a division at the Battle of the Marne and by his personal example of courage saved a threatening situation. He commanded at Verdun, where in March, 1916, he recaptured the fortresses Douaumont and Vaux. In the last two years of the War, he commanded the 6th and then the 10th Armies and in the defensive of April, 1917, his tactics were criticized but an inquiry exonerated him. In July, 1918, he defeated the Germans north of Château-Thierry and forced them to retreat. During these operations, he had under his command important American forces. Following the Armistice, he commanded the Allied Army of Occupation, with headquarters at Mayence. He was the organizer of the French "black army," was a member of the Higher Council of War, and received many decorations, foreign as well as French. He received the Grand Prix de la Littérature française in 1925, and wrote *La force noire*, crowned by the Academy in its fourth edition, 1921 (1910); *Comment finit*

la guerre (1921); *Commentaires et Portraits* (1922); and *Autour de l'Amérique latine* (1922). Consult *Le Général Mangin*, by Gabriel Hanotaux (1925).

MANITOBA, mǎn'ī-tō'vǎ. A Canadian province with an area of 251,832 square miles; population in 1911, 461,394; in 1921, 610,118, an increase of 32.2 per cent. In 1929 it was estimated at 663,200. The rural population in 1926 made up 56.4 per cent of the whole, as compared with 56.6 per cent of 1911. Males, in 1921, continued in excess of females, the division being 320,567 to 289,551. The leading cities, with their populations in 1926, were Winnipeg, the capital, 191,998 (136,035 in 1911); Brandon, 16,443; St. Boniface, 14,187; Portage la Prairie, 6513. In 1916 settlers of American origin numbered 18,274. There were, besides the settlers of British descent, large colonies of German, Austro-Hungarian, and Russian farmers.

Industry. To a large extent, the province's very rich natural resources remain undeveloped. The population is settled in the agricultural districts of the West and South, and as farming and pastoral pursuits are the leading activities, comparatively little attention is given to the forests, fishing grounds, water power, or mineral deposits. The area under field crops in 1927 was 6,561,884 acres. The acreage under spring wheat in 1927 (2,195,377 acres) was less than that of 1911 (3,094,833 acres). Oats in 1927 were planted on 1,544,511 acres. Bailey, rye, flax, roots, and forage crops are the other important field products. The total value of field crops in 1926 was \$120,026,000. The augmentation of live stock indicates the new interest of the province. Cattle in 1927 numbered 707,210, against 409,718 in 1913; sheep in 1927 were 135,982, against 42,840 in 1913, swine in 1927 were 387,260 against 184,745 in 1913. In 1927, 71 dairy establishments produced a product value of \$8,385,844 as against the total output of \$593,375 in 1910. Mineral areas included rich gold fields in The Pas district and at Elbow Lake; copper ore in the Flin Flon district; gypsum, and building materials. The total mineral production in 1927 was \$2,832,905. Other products yielded, furs, 1925-26, \$1,869,904; fish in 1927, \$2,039,738; lumber cut, 1925, \$2,178,051. In 1926 there were 797 industrial establishments; meat packing, milling, etc., are the most important, capitalized at \$127,445,924 and employing 21,201 workers (17,325 in 1910). Materials used were valued at \$75,000,529 and the product at \$132,718,452; in 1910 the product had been \$53,673,609. Out of 3,309,000 horse power estimated as available, in 1928, 255,125 was being used.

Communications. In 1928 there were in operation 4697 miles of railway as compared with 3993 miles in 1913. The telephone system, provincially owned, had 275,073 miles of line in 1928. There were 71,187 telephones on the lines. The Dominion Railway from The Pas to Port Churchill (Hudson Bay), to make possible wheat shipments via Hudson Bay, was completed in 1928-29.

Government. Revenues and expenditures for 1913 were \$5,788,070 and \$5,314,849; for 1928, \$10,741,076 and \$11,243,693. The gross debt in 1928 was \$77,050,659. In 1927-28 there were 148,763 pupils in the 3987 public schools. The enrollment had been 83,679 in 1913. The University of Manitoba had 2747 students in 1927-28; the Agricultural College, 1074 students

in 1926. Expenditures for maintenance of state-controlled elementary and secondary schools were \$9,181,640 for the year ending June 30, 1927. Total expenditures for education in 1913 were \$5,036,795; in 1926, \$10,952,462. The province is represented by six members in the Senate and 17 in the House of Commons of the Dominion Parliament. Women are permitted to stand for Parliament. Proportional representation has been adopted as the method for choosing the representatives for the city of Winnipeg.

MANIU, JULIU (1873-). A Rumanian Prime Minister, born at Szilagysomlyo. From 1906 to 1910, he was a member of the Diet. He was President of the provisional government formed in 1918, and in 1919 became President of the National Rumanian Party which consolidated with the National Peasant Party in 1926. As leader of the National Peasant Party, he became Prime Minister Nov. 11, 1928, following the resignation of the ministry headed by Vintila Brătianu.

MANLY, CHARLES MATTHEWS (1876-1927). An American mechanical engineer, born at Staunton, Va., and educated at Furman University and Cornell. After graduation, he became assistant to Secretary Langley of the Smithsonian Institution in his work on aviation and built and piloted the first Langley aeroplane in 1903. He organized the Manly Drive Company in New York in 1905 and was its chief engineer, thereafter serving as consulting engineer to various corporations and to the British War Office (1915) in the development of large aeroplanes in the United States. During 1915-20 he was associated with the Curtis Aeroplane and Motor Corporation, but later devoted his attention chiefly to consulting practice under Manly & Veal. He patented nearly 50 inventions in automotive transportation, power generation, and transmission. In 1918 he was a member of the United States Commission to the International Aircraft Standards Conference in London. He was associated with S. P. Langley in the production of his *Memoirs on Mechanical Flight* (1911).

MANN, ALBERT RUSSELL (1880-). An American agricultural educator, born at Hawkins, Pa., and educated at the New York State College of Agriculture and the University of Chicago. In 1908 he was appointed assistant professor of the dairy industry at New York State College and in the same year was secretary of the State Commission of Agriculture. He was successively secretary, registrar and editor, professor of rural social organizations, acting dean, and dean (from 1917) of the New York State College of Agriculture at Cornell. He was also director of the Cornell University Agricultural Experiment Station after 1925 and director of extension work. He was a member of many scientific societies and the author of *Beginnings in Agriculture* (1911).

MANN, HEINRICH (1871-). A German novelist and dramatist, born at Lubeck, the brother of Thomas Mann. He studied in Lubeck and Berlin. His early novels *Im Schlaraffenland* (1901); *Die Gottinnen* (1902-04), and *Die Jagd nach der Liebe* (1905), were acclaimed only by a few distinguished critics. He reached a wider circle of readers with *Professor Unrat* (1906); *Zwischen den Rassen* (1907); *Der Untertan* (1911); *Die Armen* (1912), and *Der Kopf* (1925). With his *Mutter Marie* (1927), he reached the American market, an English trans-

lation being published in 1928. He has also written the plays, *Der Weg zur Macht* (1918) and *Das gastliche Haus* (1923), and the essays *Macht und Mensch* (1919) and *Diktatur der Vernunft* (1923).

MANN, JAMES ROBERT (1856-1922). An American legislator (see VOL. XV). He was reelected Representative to Congress for successive terms from 1903 to 1923. He was minority leader from the 62d to the 65th Congresses and was Republican leader up to the time of his death. He was recognized as one of the most efficient parliamentarians in the House and was perhaps its most conspicuous member for many years.

MANN, THOMAS (1875-). A German novelist, born at Lubeck, the brother of Heinrich Mann. He studied at the universities of Munich and Bonn. After the publication of *Die Buddenbrooks* (1903), a novel of an old patrician family of Lubeck, supposed to be partly autobiographical, he grew in popularity. Since the World War, he has written *Friedrich und die grosse Koalition*, historical essays (1915); *Betrachtungen eines Unpolitischen* (1918); *Von deutscher Republik* (1923); *Bemuhungen* (1925); *Pariser Rechenschaft* (1926); and other contributions to German post-war literature. He has become known in America through translations of *Der Zauberberg* (1924), in English *The Magic Mountain* (1928); *Buddenbrooks* (1928), *Three Essays* (1929).

MANNERHEIM, BARON CARL GUSTAF (1867-). A Finnish soldier, born at Villnäs. He was an officer in the Russian Army from 1889 to 1917, and in the Finnish civil war of 1917-18, led the White Armies which defeated the attempt to establish a Bolshevik government. He was Regent of Finland in 1918-19 and has since been commander-in-chief of the garrison at Helsingfors.

MANNING, WILLIAM THOMAS (1860-). A Protestant Episcopal bishop (see VOL. XV). He was rector of Trinity parish from 1908 to 1921. In the latter year, he was consecrated Bishop of New York. During the World War, he served as volunteer chaplain at Camp Upton. He was a chevalier of the Legion of Honor of France and an officer of the Order of the Crown of Belgium. Soon after his consecration as bishop, he began an active campaign for the completion of the Cathedral of St. John the Divine in New York City.

MANOURY, MICHEL JOSEPH (1847-1923). A French general, born at Mauntenon, and educated at the École Polytechnique in Paris. He served in the Franco-Prussian War of 1870 and was general of a division in 1905. In the latter year, he received the command of the artillery of the forts of Paris and was president of the Commission of Military Schools. In 1910 he was appointed military governor of Paris and a member of the special council of war. In 1914 he was placed in command of the French Reserve Force near Paris, and it was his successful attack on September 6 which first checked General Von Kluck's drive toward Paris. He was wounded at Soissons in March, 1915.

MANSFIELD, KATHERINE (1890-1923) (MRS. JOHN MIDDLETON MURRY). An English writer, born in New Zealand. She began writing at an early age, her first published work being *In a German Pension* (1911), and soon won her way to the front rank among contemporary writers of fiction. Her book of short stories,

Bliss and Other Stories, published in 1920, won much favorable comment. This was followed by *The Garden Party and Other Stories* (1922); and, posthumously, *Poems* (1923); *The Doves' Nest and Other Stories* (1923); *The Journal of Katherine Mansfield* (edited by J. Middleton Murry, 1927), and *Letters of Katherine Mansfield*, also edited by her husband (2 vols, 1928). Before her death, she and S. S. Koteliensky translated Maxim Gorki's *Reminiscences of Leonid Andreyev* (1928).

MANSHIP, PAUL (1885-). An American sculptor, born in St. Paul, Minn. He studied art in New York and Philadelphia, and in 1909, winning a scholarship of the American Academy in Rome, he went to Europe for three years. His debt to Greece may be traced in such pieces as "The Centaur and the Dryad," "Briseis," the "Infant Hercules" fountain made for the courtyard of the American Academy at Rome, "The Lyric Muse" and "The Little Brother." The beautiful patina of these pieces is a peculiarity of Manship's work. His gleanings from Hindu and Buddhist sculptures are seen in "The Dancer and Gazelles" and the "Flight of Night." While there is reverence for tradition in Mr. Manship's sculpture, there are also very modern notes in some of his figures, e.g., "Yawning." In 1914 he was elected an Associate of the National Academy; two years later, he was made a full member. Among his works are the J. P. Morgan memorial at the Metropolitan Museum in New York City; the Civic Forum Medal; and "Dancing Girl and Fauns" and "Indian and Prong-Horn Antelope" at the Art Institute, Chicago. The bronze statuette, "Yawning," is at the St. Paul Institute, and the portrait study of his daughter, "Pauline," is in the Metropolitan Museum. The group, "Dancers and Gazelles," was exhibited at the Luxembourg in Paris and also at the Corcoran Art Gallery, Washington, and the Cleveland Museum. Copies of "Centaur and Dryad" are at the Metropolitan and at the Detroit Institute of Arts. His work won the gold medals of the American Institute of Architects (1921), American Numismatic Society (1924), and the Sesquicentennial Exposition, Philadelphia (1926). In 1929 he was awarded the National Arts Club Sculpture Prize for his "Flight of Europa."

MANTLE, (ROBERT) BURNS (1873-). An American newspaper writer, born in Watertown, N. Y. He became dramatic editor of *The Daily News* (New York) and dramatic correspondent of the *Chicago Tribune* in 1922. He was previously dramatic editor of *The Evening Mail* (New York) and Sunday editor of the *Chicago Tribune*. He was best known as the editor of *The Best Plays and Year Book of the Drama in America*, which appeared regularly after 1919. He wrote *Our Playwrights of Today* (1928).

MANUFACTURES. See **BOOTS AND SHOES**; **IRON AND STEEL**; **LEATHER**; **MOTOR VEHICLES**; **PAPER AND WOOD PULP**; **PETROLEUM**; **RUBBER**; **SILK**; **SILK, ARTIFICIAL**; **TEXTILE MANUFACTURING**; **UNITED STATES, under Manufactures.**

MANURES. See **FERTILIZERS.**

MANZ, GUSTAV (1868-). A German writer and editor of the *Tagliche Rundschau* of Berlin. He is the author of *M. Beer* (1892); *Das Tagebuch* (1893); *Das Lebende Wort* (1913); *Hundert Jahre Berliner Humors* (1916); *Martin Luther im Deutschen Wort und*

Lied (1917); *Finnland ohne Alkohol?* (1925). He also edited Emil Gött's *Verbotene Früchte* (1894); and *Briefe an einen Freund* (1919); works by Möricke (1912); Scheffel's *Ekkehard* (1916); *Selected Writings of Theodor Storm* (1917); Friedrich Vischer's *Auch Einer*; *Lachender Ernst*, an anthology of German humor; and Leander's *Traumereien an französischen Kammer*.

MARATHON. See OLYMPIC GAMES.

MARCH, PEYTON CONWAY (1864–). An American soldier, born in Easton, Pa. He graduated from the United States Military Academy in 1888 and in the same year was commissioned second lieutenant in the artillery. He saw service in the Philippines in military operations and later as administrator. From 1903 to 1907, he was a member of the General Staff in the Army and in 1904 was observer in the Russo-Japanese War. He commanded the artillery branch of the American Expeditionary Forces from the American entrance into the World War until 1918, when he was appointed acting chief of staff. On May 20, 1918, he became general and chief of staff and held that position throughout the remainder of the War. He was awarded the Distinguished Service Medal and decorations of England, France, and other European countries. He was retired in 1921.

MARCONI, mar-kō'nē, GUGLIELMO (1874–). An Italian electrical engineer (see Vol. XV). He was chosen a Senator in 1918. During the World War, he took charge of the Italian government's wireless operation. After the War, he experimented successfully on the beam system of radio telegraphy. His invention, tested in October, 1920, speeded up the transmission of words. In 1924 his marriage with the Hon. Beatrice O'Brien was dissolved, and in 1927 he married Contessa Maria Cristina Bezzi-Scali.

MARCOSSON, ISAAC FREDERICK (1877–). An American editor, born at Louisville, Ky., and educated in the schools of Louisville. From 1894 to 1903, he was on the staff of the *Louisville Times*. In 1903 he became associate editor of *The World's Work*, with which he continued until 1907, when he became a member of the staff and financial editor of the *Saturday Evening Post* (Philadelphia). From 1910 to 1913, he was editor of *Munsey's Magazine*. During and following the World War, he traveled about Europe and other parts of the world to investigate conditions and contributed articles to the *Saturday Evening Post* and other periodicals. He wrote: *The War After the War* (1916); *The Rebirth of Russia* (1917); *The Business of War* (1917); *Adventures in Interviewing* (1919); *An African Adventure* (1921); *The Black Golconda* (1924); and *Caravans of Commerce* (1927). He was the coauthor, with Daniel Frohman, of *Charles Frohman, Manager and Man* (1917).

MARGUERITTE, PAUL. See MARGUERITTE, VICTOR.

MARGUERITTE, mār'g'-rèt', VICTOR (1866–). A French author (see Vol. XV), who collaborated with his brother Paul previous to the latter's death in 1918. After the World War, he began writing sensational stories, *La Gargonne* (1922) being the best known. In 1925 he founded *Appel aux Consciences*, a periodical devoted to the question of War guilt, and in 1926, *Évolution*, a monthly devoted to international questions. His later works include *Pour Mieux*

vivre, essays (1914); *La Terre natale* (1915); *Au Bord du gouffre*, essays (1919); *Un Cœur farouche* (1920); *Le Soleil dans la géole* (1921); *La Maison de l'homme*, a play (1922); *Le Compagnon* (1924); *Les Coupables* (1925); *Les Criminels* (1925); *La "dernière guerre"* (vol. i, 1925); and *Ton corps est à toi* (1927).

MARIANNE, or LADRONE, ISLANDS. See PACIFIC OCEAN ISLANDS.

MARIE, AUGUSTE (1891–1929). A French physician and bacteriologist. A member of the staff of the Pasteur Institute, Paris, he announced discovery of a new serum for use in canine rabies in 1921. In February, 1929, he announced a cure for paralysis of the insane, but his chief effort was in the direction of improving the serum in use to combat the *Bacillus botulinus*. He worked constantly with this deadly organism, but in spite of all precautions he became infected. As the mind in this form of poisoning remains unaffected, he was able to describe his own symptoms to the last hour, death taking place 14 days after inoculation. He was posthumously awarded the Médaille d'Honneur des Epidémies. In addition to his work at the Pasteur Institute, he was the head of the Asylum de Ste Anne.

MARIE, PIERRE (1853–). A French physician and neurologist. In 1885 he published a thesis on a previously unknown disease—acromegaly—with reports of two cases. This when republished in the *Revue de Médecine* (1885) gave him a wide reputation and in 1891 a work, *Essays on Acromegaly*, was published in English by the New Sydenham Society. In 1892 appeared his *Leçons sur les maladies de moelle*, which was at once translated into English and German. He edited the *Revue neurologique* from 1893 to 1904, and in 1911, jointly with Creuzon, he brought out a large work by French neurologists, *La Pratique Neurologique*. In 1926 appeared the first volume of his reprinted articles under the title *Traité et Mémoires*.

MARIENWERDER. See ALLENSTEIN-MARIENWERDER.

MARIE OF RUMANIA (1875–). Former Queen and grandmother of King Michael of Rumania. Daughter of the Duke of Edinburgh and the Grand Duchess Marie of Russia, and granddaughter of Queen Victoria, she married Crown Prince Ferdinand of Rumania when she was 17 years old. From 1914, when her husband succeeded to the throne, until his death in June, 1927, she exercised a strong influence upon the course of Rumanian and Balkan politics, and was generally credited with bringing Rumania into the World War on the side of the Allies. Two of her daughters became the queens of Greece (now a republic) and Yugoslavia, respectively. Her eldest son, Prince Carol, renounced his right to the Rumanian throne in 1925. A tour of the United States, which she made in 1926, attracted wide publicity. She is the author of *The Lily of Life*; *Stealers of Light*; *My Country*; and *Idcirim*. In 1918 she was made an honorary member of the French Academy of Fine Arts.

MARIETTA COLLEGE. A nonsectarian, coeducational institution at Marietta, Ohio, founded in 1835. The enrollment of the college, between 1914 and 1928, increased from 200 to 393, of whom 239 were men and 154 women. The faculty increased during the period from 19 to 37, three new members having been added in 1928. The productive funds increased from

\$700,000 to \$1,264,811, and the income in 1928 was \$147,534. The library increased from 60,000 to 94,365 volumes in the same period. A department of geology was established in 1919; the entrance requirements were raised in the autumn of 1922; and annually, from 1925, the Alumni contributed toward the revolving fund of the college. A number of new buildings were constructed including a residence hall for women; a fund was being raised during the period for the construction of a men's gymnasium, and in 1928 was begun the construction of a Field House for men, to cost \$200,000. The Betsey Mills Club, a fully equipped women's gymnasium, with swimming pool, was completed in 1928, as a centre for the physical education work of the young women of the college. Edward Smith Parsons, A.M., L.H.D., succeeded G. Y. Hinman as president in 1919.

MARINE, MERCHANT. See SHIPPING; SHIPBUILDING, etc.

MARINE CORPS, UNITED STATES During the World War and since, the Marine Corps has served on vessels of the fleet, and on shore in France, Haiti, Santo Domingo, Nicaragua, Cuba, Peking, the Azore Islands, and at naval stations at home and abroad. The 4th and 5th Brigades of marines and 12 replacement battalions served with the American Expeditionary Forces in France, and the First Marine Aviation Squadron with the northern bombing group in France.

The 5th Regiment of Marines landed in France with the first expedition of American troops in June, 1917, with the 6th Regiment of Marines and the 6th Machine Gun Battalion of Marines, it formed the 4th Infantry Brigade of the 2d Division, U S Army. This division was the first one ready for service on the fighting line, and the remarkable work of the 4th Brigade of Marines around Château-Thierry and in Belleau Wood gave the corps world-wide fame. The regular strength of this brigade was 258 officers and 8211 enlisted men. During its service in France, chiefly between Mar. 15, and Nov. 11, 1918, its casualties were: killed in action or died of wounds received in action, 2457; wounded, 8898; total, 11,355, almost 3000 more than the total number of officers and men at any one time. The services of the Marine Corps in Nicaragua in connection with the insurrection and subsequent pacification and election were notable and constructive. See NICARAGUA. The strength of the Marine Corps, as authorized by the Naval Appropriation Act for 1928-29, consists of 1176 commissioned officers, commissioned warrant officers, and warrant officers, and 18,000 men.

MARINE ENGINES. See SHIPBUILDING, INTERNAL-COMBUSTION ENGINES.

MARINETTI, mar'è-nèttè, FILIPPO TOMMASO (1878-). An Italian poet and playwright (see VOL XV), founder of the Futurist movement. His later works include *Guerra, solagine del mondo* (1915); *Democrazia futurista* (1919); *Otto anime in una bomba*; *L'alcova d'acciaio* (1921); *Gli indomabili* (1922); *Amori futuristi*; *Il Tamburo di fuoco* (1922); *Futurismo e fascismo* (1924); and *Prigionieri e Vulcani*. Consult *Marinetti, l'uomo e l'artista*, by Emilio Settemelli (1921), and *Filippo Tommaso Marinetti*, by T. Domino (1921).

MARINKOVIĆ, VOYISLAV (1876-). A Yugoslavian public official, born in Belgrade. He was Serbian representative at the Inter-Allied Conference in Paris in 1916, Minister of Public

Welfare from 1914 to 1917, Minister of Interior (1921-22), and Minister for Foreign Affairs in 1926 and again in 1929. Since 1919 he has been a leader of the National Democratic Party.

MARINUZZI, GINO (1882-). An Italian conductor and composer, born at Palermo. After completing his studies at the Conservatory in Palermo, he was conductor at various theatres in Italy and made frequent appearances as guest-conductor in Paris, Madrid, and Buenos Aires. From 1919 to 1921, he was with the Chicago Opera Association. In 1922 he became principal conductor at the Teatro Regio in Turin. He composed the operas, *Il Sogno del Poeta* (Palermo, 1889), *Barberina* (ib., 1903) and *Jaquerie* (Buenos Aires, 1918; Chicago, 1920). He also wrote a symphonic poem, *Sicania*, and an orchestral suite, *Sciliana*.

MARKETING. See AGRICULTURE and HORTICULTURE.

MARLATT, CHARLES LESTER (1863-). An American entomologist (see VOL XV). He continued as assistant chief entomologist in the Bureau of Entomology, Department of Agriculture, until 1927, when he became chief of the bureau. During the years 1919-26, he was a member of the editorial committee of the *Journal of Agricultural Research*. His leading activities have been concerned with the enforcement of the Plant Quarantine Act.

MARNE, BATTLES OF THE. See WORLD WAR, under *Western Front*.

MARQUESAS ISLANDS. See PACIFIC OCEAN ISLANDS.

MARQUETTE UNIVERSITY. An institution of higher learning for men and women under Roman Catholic direction at Milwaukee, Wis., founded in 1907. The student enrollment increased in the period between 1914 and the autumn of 1928 from 1187 to 2889 regular students, 289 students in night courses in business administration, 22 in dental hygiene, 426 in the high school, 167 in the music academy, 86 in the nursing courses, and 328 in the teachers' course, making a grand total of 4233 in the University. In addition, the summer-session registration in 1928 amounted to 796. The number of members in the faculty rose from 254 to 379, and the number of volumes in the library from 30,000 to 47,700. In 1918 the University received \$333,333 from the Carnegie Foundation and in 1922, \$800,000 under the will of Mrs. Harriet Cramer. A gymnasium and a new building for the college of dentistry were built, and a science building and law building were under construction in 1924, as well as a new high-school building. In the latter year, additional courses were added and the department of education was further developed, a division of graduate study was organized and a dean appointed; courses in hospital administration were begun in 1924, and developed in 1925, under the leadership of the Rev. C. B. Moulinier, and in 1926 the school of speech was organized. Marquette enjoys the services of Jesuit instructors and administrative officers who receive no compensation other than maintenance, the value of their services over the cost of their maintenance for 1926-27 being estimated at \$119,500. President, the Rev. William M. Magee, S.J., A.M., LL.D.

MARQUIS, DON (ALD ROBERT PERRY) (1878-). An American newspaper writer and author, born at Walnut, Ill. For several years, he was associated with Joel Chandler Harris in editorial work in Atlanta, Ga. Moving to New

York, he wrote the *Sun Dial* column in the New York *Evening Sun*. In its conduct, he achieved a distinctive reputation as a wit and philosopher. In 1923 he was columnist for the New York *Tribune*. His writings include: *Hermione* (1916); *Prefaces* (1919); *The Old Soak*, a play (1921); *Carter and Other People* (1921); *Noah an' Jonah an' Cap'n John Smith*, poems (1921); *Poems and Portraits* (1922); *Revolt of the Oyster* (1922); *Sonnets to a Red-haired Lady* (1922); *The Old Soak's History of the World* (1924); *The Dark Hours* (1924); *Out of the Sea* (1927); *Archy and Mehitabel* (1927); *The Almost Perfect State* (1927); *When the Turtles Sing and Other Unusual Tales* (1928).

MARR, CARL VON (1858-). A German painter who was born in Milwaukee, Wis., studied in Weimar, Berlin, and Munich and after 1893 was professor at the Academy of Munich. He excels in historical and allegorical figures and groups and is represented in the galleries in Munich, Berlin, Bremen, Königsberg, Budapest, and the Metropolitan Museum in New York.

MARRIAGE. See DIVORCE, EUGENICS.

MARRIOTT, SIR JOHN ARTHUR RANSOME (1859-) A British historian, educated at Repton and New College, Oxford, where he was a lecturer in 1884. He was Dunkin lecturer in sociology (1903-04), and was greatly interested in the Oxford University extension movement, being secretary to its delegacy from 1895 to 1920. Elected to Parliament as a Conservative in 1917, he served on the Select Committee on National Expenditure (1917-20) and was chairman of the Select Committee on Estimates (1924-25). In 1924 he was knighted. His publications include *Makers of Modern Italy* (1889), *Charles Kingsley* (1892), *George Canning and His Times* (1903); *English Political Institutions* (1910), *England Since Waterloo* (1913), *English History in Shakespeare* (1918); *The Right to Work* (1919); *Syndicalism: Economic and Political* (1921); *England under the Tudors* (1922), *Economics and Ethics* (1923), *Our Own Times* (1924); *The Mechanism of the Modern State* (2 vols., 1927); *Empire Settlement* (1927); and *How We Are Governed* (1928).

MARSAL, FRÉDÉRIC FRANÇOIS. See FRANÇOIS-MARSAL, FRÉDÉRIC

MARSEILLES, mar-sälz'. The principal seaport of France, second city of the Republic in point of population, capital of the Department of Bouches-du-Rhône, and 862 kilometers (535.6 miles) from Paris. The population at the census of 1926 was 652,196. The suburbs, with a constantly increasing population, are forming a group of small cities around Marseilles. In April, 1927, the waterway through the Rove Tunnel, which had taken 23 years to complete at a cost of 135,000,000 francs, was formally opened by President Doumergue. This tunnel is the principal feature of the southern section of the 50-mile Marseilles-Rhône Canal, connecting the Port of Marseilles with the Étang de Berre, a lake about 14 miles northwest of the city and separated from the sea by a narrow neck of land. The tunnel is 4½ miles long, 72 feet wide, and 37 feet 6 inches high above water level, with a water depth of 13 feet. Two 1500-ton barges can pass through it without difficulty. This was the last connecting link of the Marseilles-Rhône canal system, joining the Netherlands, and Central Europe. It is at sea level throughout its entire length except for a single lock at Arles.

The opening of the southern section has developed Port de Bouc on the Étang de Berre as an annex port to Marseilles. The project dates from 1841, but work on it was begun only in 1906. It has been declared to be the greatest engineering feat of its kind since the construction of the Panama Canal. See CANALS.

In recent years, the Port of Marseilles, comprising 11 miles of quays and 750 acres of dock area, has expanded far along the shore toward the north, and plans for future expansion will carry it still farther in the same direction. Before the outbreak of the World War, the problem of increasing port facilities was being attacked on far-reaching lines in a scheme which estimated future requirements until 1932 on the assumption of a 3 per cent annual increase in traffic. Events proved that actuarial basis to have been a conservative one. The low French railway charges encouraged foreign manufacturers to ship their product for transit to Mediterranean countries and the Near East by the overland route to Marseilles. In 1928, 4271 vessels of 11,574,657 tonnage entered the port and 4472 vessels were cleared. The passenger traffic also increased to approximately 800,000 a year, half of which was between France and the North African colonies. In 1928 was undertaken the enlargement of the Bassin de la Joliette and construction of the Bassin du Pharo at an estimated cost of 416,000,000 francs. The Chamber of Commerce also adopted plans for the construction of two other basins extending out to sea from the southern end of the port.

MARSEILLES-RHÔNE CANAL. See CANALS and MARSEILLES

MARSHALL, ARCHIBALD (1866-) A British novelist, who was educated at Highgate School and Trinity College, Cambridge. He worked in London, studied for the clergy, and became a publisher and journalist. For three years after his marriage (1902), he lived in the Black Forest, which is feebly described in *Exton Manor* (1907). He traveled much, including three visits to the United States, where he received an honorary Litt.D. from Yale University. His best-known books are the series about the Clinton family: *The Squire's Daughter* (1909); *The Eldest Son* (1911), *The Honour of the Clintons* (1913); *The Old Order Changeth* (1915); and *The Clintons and Others* (1919). These have humor and show a keen observation of English country life. His other works include *Peter Buncey, Undergraduate* (1899); *Richard Baldock* (1906), *Roding Rectory* (1914); *Upsidonia* (1915), *Watermeads* (1916); *Abington Abbey* (1917); *The Graftons* (1919), *The Hall and the Grange* (1921); *Anthony Dare* (1923); *The Education of Anthony Dare* (1924); *Anthony Dare's Progress* (1925); *The Allbright Family* (1926), *Simple Stories* (1927); and *Simple People* (1928). He also wrote two books on his travels: *Sunny Australia* (1911) and *A Spring Walk in Provence* (1920), and edited an abridged edition of *Boswell's Johnson* (1923).

MARSHALL, LOUIS (1856-1929). An American lawyer and publicist (see VOL. XV). He took part in many arbitrations and mediations between employers and laborers and was a member of the arbitration board which settled the New York clothing workers' strike in 1919. He was also chairman of the commission to fix

the price of bread and secured the enactment of laws regulating private and foreign bankers and other reform legislation. In 1920-21 he was president of the Jewish Relief Committee which collected more than \$75,000,000 for relief of Jewish war sufferers. He was also a member of the international committee whose efforts resulted in treaties with Poland, Rumania, Yugoslavia, Czechoslovakia, and other countries, to guarantee equal rights to racial, religious, and linguistic minorities.

MARSHALL ISLANDS. See PACIFIC OCEAN ISLANDS.

MARSTON, ANSON (1864-). An American civil engineer. He was born at Seward, Ill., studied at the West Rockford (Ill.) High School, Berea College, Ky., and Cornell University, receiving the degree of C.E. at Cornell in 1889. For three years, he was engineer on location and construction work for the Missouri Pacific Railway. He went to the Iowa State College at Ames as professor of civil engineering in 1892, and after 1904 was dean and director of the engineering department, which under his administration has had a rapid growth. As a member of the Iowa State Highway Commission (1904-27), of which he was chairman for three years, he directed the building of State roads. In the World War, he served as major and lieutenant colonel of the U. S. Army Engineers, commanding the 97th Engineers until demobilization.

MARTEAU, mar'tō' HENRI (1874-). A French violinist (see VOL XIV). In 1915 he resigned his professorship at the Königliche Hochschule für Musik in Berlin and was second conductor at the opera in Göteborg until 1920. During 1921-24 he was professor of violin at the Deutsche Akademie in Prague and then for two years its director. After teaching a year at the Leipzig Conservatory (1926-27), he became principal professor of violin at the Dresden Conservatory in 1928. He wrote an opera, *Meister Schwalbe* (Plauen, 1921); two violin concertos; a 'cello concerto; *Sinfonia Gloria Naturae*; three string quartets; a clarinet quintet; *Serenade*, for wind-instruments; pieces for organ, choruses; and several books of studies for violin.

MARTIN, EVERETT DEAN (1880-). An American sociologist, born at Jacksonville, Ill., and educated at Illinois College in Jacksonville and at McCormick Theological Seminary. In 1907 he was ordained into the Congregational ministry and served as pastor in several churches in Illinois. From 1910 to 1914, he was pastor of the Unitarian church in Des Moines, Iowa, and from 1916, lecturer on social philosophy at the People's Institute, New York. He was assistant director and secretary, from the latter year, of the Cooper Union Forum and acting director in 1921-22. He founded the People's School of Philosophy, lectured on social psychology at the New School for Social Research (1922), and was chairman of the National Board of Review of Motion Pictures. His book, *The Behavior of Crowds* (1920), attracted attention. It was followed by *Mystery of Religion* (1924); *Psychology, What It Has to Teach You* (1924); *Meaning of a Liberal Education* (1926).

MARTIN, FRANKLIN H. (1857-). An American surgeon, born at Ixonia, Wis. He received his M.D. degree from Chicago Medical College in 1880, was cofounder of the Chicago Postgraduate Medical School and organized the Charity Hospital. In 1905 he founded and be-

came editor of the periodical, *Surgery, Gynecology, and Obstetrics* and in 1913 he organized the American College of Surgeons. His private practice has been largely gynecology and abdominal surgery and he has been associated in the same capacity with colleges and hospitals. Numerous foreign distinctions have been conferred on him. He published *Treatise on Gynecology* (1903); *South America from a Surgeon's Viewpoint* (1923); and *Australia and New Zealand* (1924).

MARTIN, GLENN L. (1886-). An American airplane manufacturer, born at Macksburg, Iowa. In 1907 he began to build gliders and in the next year designed and built the pusher type of airplane. In 1909 he established one of the first airplane factories in the United States and built monoplanes, water aircraft, etc. He gave many exhibition flights in Canada and the United States and in 1912 moved his factory to Los Angeles. The War Department ordered his model TT in 1913, and later the Army adopted it for training purposes. During 1914-16 he built for the Government of Holland and produced several new models for the U. S. Army. In 1917 he organized his own company at Cleveland and began designing and building the Martin bomber, the first American-designed airplane for Liberty engines.

MARTIN, HELEN REIMENSNYDER (1868-). An American author (see VOL XV). Her later books include *Those Fitzingers* (1917), *Gertrude Swartz: Fanatic or Christian?* (1918); *Magpie of Virginsburg* (1918), *The Schoolmaster of Hessville* (1920); *The Marriage of Susan* (1921), *The Church on the Avenue* (1922); *The Snob* (1924); *Challenged* (1925); *Ye That Judge* (1926); *Sylvia of the Minute* (1927).

MARTIN DU GARD, ROGER (1881-). A French novelist and paleographer who was born in Paris and educated at the University and the École des Chartes. His works portrayed the social and mental state of France at various periods. *Jean Barois* (1913) did this for the period of the Dreyfus case, continuing to the World War, and *Les Thibault* (1922-) was a similar study of post-war France. It is the story of a bourgeois family and was published intermittently as separate volumes of a series, these volumes being *Le cahier gris* (1922); *Le pénitencier* (1922); *La belle saison* (1923), *La consultation* (1928); and *La sœur luna* (1928). He also wrote *Décenir* (1908); *Le testament du père Lelcu*, a play produced as part of the repertory of the Vieux Colombier Theatre from 1914 to 1921, and *La Gonsfle, une farce paysanne* (1928).

MARTINELLI, mar'té-nē'lē, GIOVANNI (1885-). An Italian operatic tenor, born at Montagnana. He began his musical career as a clarinet player in an Italian regiment and later studied singing with Mandolini. He made his début in Verdi's *Ernani* in Milan (1910). In 1912 he sang at Covent Garden and in 1913 he became one of the leading tenors at the Metropolitan Opera House, where, after the death of Caruso, he succeeded to many of the latter's rôles. He was also heard in Rome and Buenos Aires.

MARTINEZ RUIZ, José (1874-). A Spanish novelist, essayist, journalist, and critic, who wrote under the pseudonym of "Azorin." After studying law at the University of Valencia, he took up letters in Madrid, publishing his first

novel, *La Voluntad*, in 1902. He was elected to the Cortes in 1907 and 1914. As a writer, he is known for his close study of the social and spiritual surroundings of Spain's most noted literary figures. Other works include *El Alma Castellana* (1900); *La Ruta de Don Quijote* (1905); *Castilla* (1912); *Al margen de los clásicos* (1915); *Clásicos modernos*; and *Los valores literarios*.

MARTINEZ SIERRA, GREGORIO (1881-). A Spanish dramatist, born in Madrid, who produced his first play, *El Poema del trabajo*, in 1898. Abandoning the theatre temporarily for journalism and novel writing, he returned after his Spanish translations of the Catalan dramatist, Santiago Rusiñol, were popular successes. Then followed *La Sombra del padre* (1909); *Canción de Cuna* (1911); *Libro entre espigas* (1911); *El Reino de Dios* (1916); *Don Juan de España* (1922); and his dramatization of Dicken's *Cricket on the Hearth*, *El Grillo del Hogar* (1923).

MARTINI, mār-tē'nē, FERDINANDO (1841-). An Italian dramatist and public official, born at Monsummano. He was Minister of Education (1892-93), Governor of Eritrea (1898-1908), and Minister of Colonies (1914-16). His works include *I nuovi ricchi* (1863); *Il peggior passo è quello dell'uscio* (1873); *La Marchesa* (1876); *Nell'Africa italiana* (1891); *La Vipera*, a comedy (1894); and *Peccato e Penitenza* (1913).

MARTINIQUE, mār-tē'nēk' An island colony of France, located in the Lesser Antilles in the West Indies. Its area is 385 square miles; population at census of 1927, 234,695. The chief commercial town is Fort-de-France, with a population of 43,338. The population is almost wholly Creole except for the considerable number of British Indian, Chinese, and African laborers. Sugar, rum, and cocoa are the chief products. The sugar export, which reached 40,000 tons before the World War, rose to 40,397 tons in 1927. Rum exports in 1927 totaled 5,224,021 gallons. Exports for the years 1913, 1920; and 1927 were 28,896,814, 128,953,479, and 229,373,089 francs, respectively. Imports for the same years were 22,144,315, 132,186,517, and 212,594,604 francs. In 1911, 88 vessels of 156,000 tons entered Martinique ports, while in 1927, 550 vessels of 1,040,764 tons entered. The budget for 1927 balanced at 66,103,756 francs. Martinique was visited by a severe tropical hurricane which swept over the French West Indies, Sept. 12, 1928. Although loss of life was small, the damage to crops was considerable, particularly to fruit and cacao trees and to sugar cane.

MARYLAND. The forty-first State in size (12,327 square miles) and the twenty-eighth in population; capital, Annapolis. The population increased from 1,295,346 in 1910 to 1,499,661 in 1920, or by 11.9 per cent; estimated population, 1928, 1,616,000. The white population rose from 1,062,639 (1910) to 1,204,737 (1920); Negro, from 232,250 to 244,479; native white, from 958,465 to 1,102,560. The foreign-born white population fell from 104,174 to 102,177. The urban population was 658,192 in 1910, 869,422 in 1920; the rural decreased from 637,154 to 580,239. The growth of the principal cities was as follows: Baltimore (q.v.), 1910, 558,485; 1920, 733,826; Cumberland, 21,839 to 29,837; Hagerstown, 16,507 to 28,064.

Agriculture. After a period of decline, the number of farms increased 2.3 per cent, or from

47,908 in 1920 to 49,001 in 1925; but the area in farms decreased 6.5 per cent, or from 4,757,999 to 4,433,398 acres. The improved land in farms in 1920 embraced 3,136,728 acres. Crop land acreage (1925) was 2,227,515. The total value of farm property rose from \$286,167,028 in 1910 to \$463,638,120 in 1920, but declined to \$397,092,670 in 1925; the average value per farm was \$5849 in 1910, \$9678 in 1920, and \$8104 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. The total percentage of land used for agricultural purposes decreased from 79.5 in 1910 to 74.8 in 1920 and to 69.7 in 1925. Of the total number of farms in 1925, 35,138 were operated by their owners; 936, by managers; and 12,937, by tenants. The comparative figures for 1910 are 33,519; 988, and 14,416. White farmers numbered 41,699 in 1920 and 42,280 in 1925; colored, 6209 in 1920 and 6721 in 1925. The farms reported as under mortgage numbered 11,339 in 1920 and 10,513 in 1925. The number of dairy cows was 188,537 in 1920; 172,581 in 1925; "beef" cows, 13,704 in 1920 and 19,160 in 1925; mules, 32,621 in 1920 and 30,733 in 1925; swine, 306,452 in 1920, and 187,656 in 1925; sheep, 103,027 in 1920 and 91,878 in 1925. The estimated production of the chief crops in 1928 was as follows: Corn, 19,345,000 bushels; wheat, 8,745,000, oats, 1,701,000, potatoes, 5,405,000; sweet potatoes, 1,500,000, apples, 2,190,000; peaches, 465,000, pears, 193,000; tobacco, 21,700,000 pounds, hay, 759,000 tons. Comparative figures for 1913 are corn, 22,110,000 bushels; wheat, 8,113,000; oats, 1,260,000; barley, 145,000; potatoes, 3,741,000; hay, 491,000 tons; and tobacco, 18,500,000 pounds.

Mineral Production. Coal maintained its rank as the leading mineral product of the State from 1914 on, but the output underwent a gradual decline. The average yearly production for the period 1911-15 was 4,549,000 short tons; for 1916-20; 4,148,000; for 1921-25, 2,033,000. There was a partial recovery in 1926, when 3,078,353 short tons, in value \$6,800,000, were produced. In 1927, a year of labor troubles in the coal fields of the United States, the production of Maryland fell to 2,814,842 tons, valued at \$5,817,000. In 1928 the total production was 2,686,979 tons valued at \$4,954,000, the output of 80 mines. The clay products of 1926 attained a value of \$6,073,247. The stone output of that year totaled \$2,177,102. The entire mineral production of the State for 1927 as reported by the U. S. Bureau of Mines was \$20,469,294.

Manufactures. Maryland is an important manufacturing State. In 1909 there were in the State 4837 manufacturing establishments; in 1919, 4937; in 1925, 3179 and in 1927, 3205. Persons engaged in manufactories numbered 125,761, 165,875, 125,761, and 126,700; and capital invested amounted to \$251,226,828 in 1909, and \$619,606,983 in 1919. The products in 1909 were valued at \$315,669,150; in 1919, at \$873,944,744; in 1925, at \$925,688,028; and in 1927, at \$943,410,896. The large increase in the value of products about 1919 was chiefly due to the change in the industrial conditions brought about by the War and cannot properly be used to measure the normal growth of production during the period involved; but the increase in the number of wage earners up to the year 1919 clearly indicates a decided increase in the intrinsic value of manufactures. The manufac-

ture of men's clothing ranks first in value of product: in 1909 it was \$36,921,000; in 1914, \$39,048,000; and in 1919, \$72,589,000. Shipbuilding made great gains, from \$3,535,000 in 1909, and 4,521,000 in 1914, to \$67,310,000 in 1919; the extraordinary growth in the value of this product was due to the increase in shipping during the War. Slaughtering and meat packing had products valued in 1909 at \$13,683,000; in 1919 at \$43,228,000; and in 1925, at \$38,425,638. Fertilizers to the value of \$9,673,000 were manufactured in 1909; \$37,014,000 in 1919; and \$28,150,127 in 1925. The chief manufacturing city of the State is Baltimore, having 2502 manufacturing establishments in 1909, with products valued at \$186,978,000; 2797 with \$677,878,000 in 1919; and products to the value of \$678,947,000 in 1925.

Education. Marked improvement was made both in administration and development of the school system. In 1916 the school system was reorganized, and the issuing of teachers' certifications was made a State function. An equalization fund was established enabling every county to pay the State minimum salaries. This fund made it possible to secure a salary increase, ranging from \$150 to \$700 per teacher. Efforts were made in a publicity campaign (1921-22) to promote the organization, administration, and supervision of schools; to secure larger attendance at the State normal schools; establishing extension courses for teachers during the school year at State expense; promoting attendance at summer schools; and carrying out the provisions of the law passed in 1922 for more efficient supervision of both town and rural schools. Vocational education was carried on after 1917. All types of instruction which had developed in the national programme, except industrial rehabilitation, were in operation in Maryland. The total enrollment of white pupils in 1925-26 was 214,084; of colored, 49,165; of all pupils, 263,249. In the elementary schools for colored pupils were enrolled 46,264; in the high schools, 2901. Enrollment in all schools, both white and colored, was 237,125 in 1913. The percentage of illiteracy in the State was 8.7 in 1910 and 6.8 in 1920. Among the native white population it decreased from 3.7 to 2.5; among the foreign-born, from 12.3 to 14.3; and among the Negro, from 28.6 to 22.2 per cent.

Finance. State expenditures in the year ending Sept. 30, 1927, as reported by the United States Department of Commerce, were for maintenance and operation of departments, \$18,109,070 (of which \$3,512,036 was aid to local education), for conducting public-service enterprises, \$143,333, for interest on debt, \$1,417,686; for permanent improvements, \$5,133,780; total, \$24,803,869 (of which \$7,793,891 was for highways, \$3,398,224 being for maintenance and \$3,895,667 for construction). Revenues were \$24,439,916; of these, property and special taxes formed 30.4 per cent; departmental earnings, 16.1 per cent; licenses, including gasoline tax, 40.4 per cent. Assessed property valuation was \$2,348,840,482; State taxation thereon, \$5,906,464. Net State indebtedness on Sept. 30, 1927, was \$23,872,776.

Political and Other Events. Maryland is traditionally Democratic, but has been a debatable State in recent years. In 1914 John Walter Smith, Democrat, was reelected to the United States Senate; the Democrats elected five members of the House of Representatives and the Republicans, one. In September of that year,

the hundredth anniversary of the defeat of the British at North Point in Baltimore and of Francis Scott Key's writing of "The Star-Spangled Banner" during the British bombardment, was celebrated. In November, 1915, Emerson C. Harrington, Democrat, was elected governor. The Democrats won control of the Legislature. In the same election, amendments to the State constitution were adopted, permitting increased home rule for Baltimore and the counties, and instituting the referendum except on sumptuary legislation. President Wilson carried the State in 1916. Dr. Joseph I. France, Republican, was elected United States Senator, and the seats in the House were divided between four Democrats and two Republicans. An amendment to the State constitution was adopted, effecting a drastic budget system for the State government. Special referendums were held on prohibition in local areas, under the local-option system then in force. Baltimore voted heavily against prohibition, most of the smaller areas voting also rejected it. In 1917 the Republicans won the House of Delegates and the Democrats, the State Senate. The Legislature was Republican on joint ballot for the first time in 20 years. In 1918 the Congressional delegation was divided equally.

A new charter was voted by the people of Baltimore, under the home-rule amendment of 1915. In May, 1919, the Republicans won a decided victory in the municipal elections of Baltimore, William F. Broening, Republican, defeating George Weenis Williams, Democrat, for Mayor. In November, 1919, Albert C. Ritchie, Democrat, was elected governor, defeating Harry W. Nice, Republican, by less than 200 plurality. The Legislature was Democratic. In November, 1920, Warren G. Harding, Republican, swept the State for President, against James M. Cox, Democrat; Ovington E. Weller, Republican, was elected United States Senator; the Republicans won four members of the House. In 1921 the Democrats elected the majority of the Legislature. In 1922 William Cabell Bruce, Democrat, was elected United States Senator; the six seats in the House were divided equally between Democrats and Republicans; and the people adopted constitutional amendments increasing Baltimore's representation in the Legislature and rendering State elections quadriennial, with four-year terms for elected officers including legislators, and legislative sessions in the odd years. In May, 1923, Howard W. Jackson, Democrat, was elected mayor of Baltimore. In November, 1923, Albert C. Ritchie, Democrat, was reelected governor. The vote for President in 1924 was Coolidge, 162,414; Davis, 148,072; LaFollette, 47,157. Governor Ritchie was reelected in 1926, for a four-year term. The vote for President in 1928 was Hoover, 301,479; Smith, 223,628. Phillips Lee Goldsborough, Republican, was elected senator.

Legislation. Maryland's Legislature met in even years until and including the 1924 session. No regular session occurred thereafter until 1927, when was begun a system of sessions held in the odd years. In 1914 the Legislature enacted a new tax law and established a new tax commission; it also passed a workmen's-compensation law, and a new oyster-planting law. It also submitted to the people the home-rule and referendum amendments to the constitution. In 1916 the Legislature submitted to the people the budget amendment, providing for a budget to be prepared by the governor. A modern school law

was enacted and the State departments were partially reorganized. In May and June, 1917, a special war session appropriated an emergency fund, created the State Council of Defense, and passed war measures. In 1918 the Legislature expanded the corporate limits of Baltimore. In 1920 the Legislature instituted the merit system in the civil service of the State. In 1922 it enacted a measure reorganizing the State government into departments, and submitted to the people a proposal for a \$9,000,000 soldiers' bonus; the latter was invalidated by the courts. This session also submitted to the people the constitutional amendment increasing Baltimore's representation in the Legislature and an amendment providing one State election every four years instead of every two. Under the terms of the latter, State elections would be held in every other even year, beginning with 1926, and State officials, including legislators, would be elected for four-year terms. Successive Legislatures refused to pass bills for State enforcement of the Eighteenth Amendment. State taxation was imposed, in 1927, for the elimination of grade crossings of highways with railroads.

MARYLAND, UNIVERSITY OF. A State institution at College Park and Baltimore, Md., founded in 1807. The student enrollment increased from 1200 in 1914 to 3391 in the autumn term of 1928, with an additional registration of 626 in the summer session, the number of faculty members increased from 211 to 445; and the library from 25,000 to 52,473 volumes. The annual income increased from \$250,000 in 1914 to \$2,344,660, including appropriations and other receipts, in 1928. Part of an extensive programme under way in 1923 included a stadium, a gymnasium and armory, a dairy manufacturing laboratory, costing \$262,800, a research laboratory for animal pathology, all at College Park, and at Baltimore, a new building which was purchased and equipped at a cost of \$40,000 for the schools of dentistry and pharmacy; a new X-ray laboratory, equipped in the university hospital at a cost of \$10,000, and a nurses' home. A dining hall and a science building were under construction during 1925, 1926, and 1927, and the campus was landscaped and new roads and walks were laid. In 1923 the Baltimore College of Dentistry, the first dental college to be established in the world, was consolidated with the School of Dentistry of the University of Maryland, and extension courses in commerce were reorganized as the College of Commerce and Business Administration; and the university changed from the trimester to the semester system. President, Raymond A. Pearson, M.S., D.Agr., LL.D.

MARX, marks, WILLIAM (1863-) A German statesman, born in Cologne. He studied law and became well known as a jurist. He was long active in the Clerical Party or Centre Party, in later years as its chairman, and served in the Prussian Diet. He has been a member of the Reichstag since 1910 and was Chancellor in 1922-25 and 1926-28, attending several of the most important conferences on reparations and other questions, including the conference on the Dawes Plan in London in August, 1924. Largely through his efforts, an agreement was finally obtained on the Dawes Plan. See *GERMANY*, under *History*.

MASARYK, THOMAS GARRIGUE (1850-). The first President of Czechoslovakia, born in Hodonin, Moravia, and educated in the univer-

sities of Vienna and Leipzig. He taught for several years, was professor at the new Bohemian University of Prague (1882), and was head of the Czechoslovak realistic movement in philosophy, literature, and politics, founding several reviews. In 1891 he entered the Parliament of Vienna, resigning two years later to devote himself to the moral education of the Czech nation. Relected in 1907, he resisted the encroachments of Germany in Austria and the aggressive policy of the latter in the Balkans. At the outbreak of the World War, he escaped first to Italy and Switzerland, later settling in London, where he became a lecturer at King's College. Throughout the War, he organized the Czechoslovak movement of independence, visited the United States in its behalf, and, at the Armistice, the Czechoslovak National Council of which he was the head, was recognized by the Allies as the provisional government of Czechoslovakia. On the establishment of the Republic, he was elected President in 1918, and reelected in 1920 and 1927. By a provision of the constitution, he is qualified to hold that office during his entire life. His many books include *On Suicide in Modern Civilization* (1881); *Essay on Concrete Logic* (1886); *The Bohemian Question* (1896); *The Problem of Small Nations in the European Crisis* (1915); *The New Europe* (1918); *The World Revolution* (1925), and *The Making of a State* (1927).

MASEFIELD, JOHN (1878-). An English poet and dramatist (see VOL. XV). In 1922 he received an honorary D Litt from Oxford. His later works include. *The Faithful* (1915); *Gallipoli*, a vivid description of the campaign there, in which he participated (1916); *The Old Front Line* (1918); *Enslaved, and Other Poems* (1919); *Reynard the Fox* (1919); *Right Royal* (1920); *Shakespeare and Spiritual Life* (Romanes lecture, Oxford, 1924); the novels *Sard Harker* (1924) and *Odtaa* (1926); the plays *Trial of Jesus* (1925) and *Tristan and Isolt* (1927); *Sea Life in Nelson's Time* (1925); *Philip the King, and Other Poems* (1926); *The Midnight Folk* (1927); *The Coming of Christ* (1928); *Midsummer Night* (1928); *Collected Poems* (1929), and *The Hawbucks* (1929).

MASON, EDITH (BARNES) (1893-). An American dramatic soprano, born at St. Louis, Mo. After studying with several teachers in New York, Boston, Philadelphia, and Paris, she made her debut as Nedda in *Pagliacci* with the Boston Opera Company (Jan. 27, 1912). During the next three years, she sang in Nice, Marseilles, and Paris. In 1915-17 she was a member of the Metropolitan Opera Company. Then followed engagements in Havana, Caracas, and Mexico City, until 1919. In 1919-20 she appeared in Monte Carlo and again in Paris. She was one of the leading singers of the Chicago Opera Association, 1921-22, and the Chicago Civic Opera Company, 1923, and also sang two seasons with the La Scala Opera, Milan. In 1919 she married Giorgio Polacco.

MASON, MAX (1877-). An American mathematician and university president, born at Madison, Wis., and educated at the University of Wisconsin and at Göttingen. In 1903 he became instructor of mathematics at the Massachusetts Institute of Technology and was appointed assistant in that subject at the Sheffield Scientific School of Yale, where he remained until 1908, when he accepted a call to Wisconsin. He was professor of mathematical physics there

until 1925, when he was called to the presidency of the University of Chicago. In 1928 he resigned that office and became director of the division of natural sciences of the Rockefeller Foundation, New York. He made important studies on the calculus of variations, and the electromagnetic theory in pure mathematics. In the applied branches, he contributed researches on submarine detection devices and acoustical compensators. During the World War, he was a member of the research staff at the United States Navy Experiment Station at New London and a member of the division of physical sciences of the National Research Council. He is the author of *The New Haven Mathematical Colloquium* (1910).

MASSACHUSETTS. The forty-fourth State in size (8266 square miles) and the sixth in population; capital, Boston. The population increased from 3,366,416 in 1910 to 3,852,356 in 1920, a gain of 14.4 percent; estimated population, 1928, 4,290,000. The white population rose from 3,324,926 (1910) to 3,803,524 (1920); Negro, from 38,055 to 45,466; native-born white, from 2,273,876 to 2,725,990; foreign-born white, from 1,051,050 to 1,077,534. The urban population mounted from 3,125,367 to 3,650,248; the rural decreased from 241,049 to 202,108. The growth of cities was as follows: Boston (q.v.), 670,585 in 1910 and 748,060 in 1920. Worcester (q.v.), 145,986 to 179,754; Springfield (q.v.), 88,926 to 129,614; New Bedford (q.v.), 96,652 to 121,217; and Fall River (q.v.), 119,295, to 120,485.

Agriculture. The number of farms decreased 13.3 per cent, or from 36,917 in 1910 to 32,001 in 1920, but rose thereafter to 33,454 in 1925. The land in farms decreased 13.3 per cent, or from 2,875,941 acres in 1910 to 2,494,477 in 1920 and diminished farther to 2,367,629 in 1925. The improved land in farms totaled 908,834 acres in 1920. The total value of farm property rose from \$226,474,025 in 1910 to \$300,471,743 in 1920, but fell to \$254,602,941 in 1925; the average value per farm was \$6135 in 1910, \$9389 in 1920, and \$8770 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. The total percentage of land used for agricultural purposes in 1910 was 55.9, compared with 48.5 in 1920 and 46.0 in 1925. Of the total number of farms in 1925, 30,870 were operated by owners; 979, by managers; and 1605, by tenants. The comparative figures for 1910 are 32,075; 1863; and 2079. White farmers in 1920 numbered 32,880, compared with 36,793 in 1910. In 1920, 22,950 of these were natives, as compared with 28,431 in 1910. Foreign-born farmers, for the most part from Canada, numbered 8930 in 1920 and 8362 in 1910. Negro farmers numbered 103, both in 1910 and 1920. There were 18 Indian farmers in 1920, compared with 21 in 1910. Farms reported as under mortgage, 12,632 in 1920, decreased to 12,248 in 1925. The number of dairy cows in 1920 was 173,844; 144,898 in 1925; "beef" cows, 5850 in 1920 and 1937 in 1925; sheep, 18,880 in 1920 and 10,114 in 1925. The development in agriculture was in the direction of market gardening and special crops, such as tobacco and onions. The estimated production of the chief farm crops in 1928 was as follows: Corn, 1,890,000 bushels; potatoes, 1,620,000; hay, 732,000 tons; and tobacco, 9,462,000 pounds. Comparative figures for 1913 are corn, 1,944,000

bushels; potatoes, 2,835,000; hay, 575,000 tons; and tobacco, 9,455,000 pounds.

Manufactures. Massachusetts is one of the most important of the industrial States. In 1920 there were 66 cities having more than 10,000 inhabitants, whose combined populations in that year formed 81.0 per cent of the total for the State and in 1919 reported 86.3 per cent of the value of the State's manufactured products. In 1909 there were 11,684 manufacturing establishments in the State; in 1919, 11,906; in 1925, 10,027; and in 1927, 10,037. Wage earners in manufactories numbered 713,836 in 1919; 591,438 in 1925, and 578,068 in 1927. Capital invested amounted to \$1,279,686,558 in 1909 and \$2,947,108,527 in 1919. The value of the products in 1909 was \$1,490,529,386, in 1919, \$4,011,181,532; in 1925, \$3,426,617,326; and in 1927, \$3,317,851,888. The increase in value of the products about 1919 was in great measure due to changes in industrial conditions caused by the World War. An increase in the number of persons engaged in manufactories, on the other hand, clearly indicated a growth. The most important industry in point of value of products is the manufacture of cotton goods, valued in 1909 at \$786,462,000; in 1919, at \$604,938,000; in 1925, at \$345,864,097. The manufacture of boots and shoes attained \$236,343,000 in 1909; \$573,037,000 in 1919; \$240,943,504 in 1925. Woolen, worsted, and felt goods were valued \$141,967,000 in 1909; \$352,913,000 in 1919; \$216,448,325 in 1925. The manufacture of leather amounted in value in 1909 to \$40,002,000, in 1914, to \$45,265,000; and in 1919, to \$129,595,000. The most important manufacturing cities are Boston, Worcester, Fall River, Lawrence, and New Bedford. In Boston in 1909, there were 3195 establishments with a products value at \$244,793,000; in 1919, 3077, with \$618,922,000, in 1925, products to the value of \$585,992,000. In Worcester in 1909, there were 580 with \$77,148,000; in 1919, 618 with \$208,706,000; in 1925, products of \$210,461,000. Fall River had 288 manufacturing establishments, with products valued at \$64,146,000 in 1909; in 1919, 293, with \$63,246,000; in 1925, products valued at \$142,885,000. Similar figures for New Bedford were 207, with \$53,238,000 in 1909; 267, with \$210,773,000 in 1919, \$143,551,000 in 1925. Other important manufacturing cities are Lowell, Lynn, Somerville, Brockton, Springfield, Cambridge, and Haverhill.

Education. Massachusetts, from its earliest history has devoted its utmost efforts to improvement of the educational facilities and conditions of its inhabitants. The Legislature has passed in recent years many important measures affecting education; among the most notable was an act, in 1919, establishing and maintaining continuation schools and courses of instruction for employed minors. Another act of 1919 raised the minimum educational requirements for leaving school to seek employment from the completion of the fourth to the completion of the sixth grade; a third established special classes for mentally retarded children. In 1921 the provisions of Congress for promotion of vocational rehabilitation were accepted by the State; a measure was passed providing for physical education for pupils in the elementary and secondary schools; a minimum salary of \$750 was established for all full-time teachers in the public day schools; and three measures to promote civic education in the public schools were

enacted, requiring courses in duties of citizenship, United States history and civics, and the Constitution of the United States. The growth of the school system is indicated by the fact that in 1914 the total school enrollment was 576,510; in 1925-26, 755,832, of which total 138,963 were in secondary schools. The percentage of illiteracy in the State decreased from 6.2 in 1910 to 5.9 in 1920; among the native whites, from 0.4 to 0.3; among the Negroes, from 9.7 to 8.2. Among the foreign-born white population illiteracy increased from 13.1 to 13.5 per cent.

Finances. State expenditures in the year ending Nov. 30, 1928, as reported by the U. S. Department of Commerce, were: for maintenance and operation of departments, \$41,533,191 (of which \$2,519,987 was for local education); for conducting public-service enterprises, \$184,287; for interest on debt, \$1,466,824, for permanent improvements, \$8,585,695, total, \$51,769,991 (of which \$12,376,511 was for highways, \$6,570,751 being for maintenance and \$5,805,760 for construction). Revenues were \$59,348,470, of these property and special taxes formed 47.9 per cent; departmental earnings, 7 per cent, licenses, 28.1 per cent. Assessed valuation of property was \$7,161,309,871; State taxation thereon, \$8,500,000. Net State indebtedness on Nov. 30, 1927, was \$20,439,543.

Legislation. In 1914 and 1915 the Legislature submitted a constitutional amendment giving the suffrage to women. It was defeated by a large majority. In 1916 the Legislature amended the laws relating to judicial procedure and also passed a defense act and amended the workmen's-compensation law. In 1919 measures were passed providing for absentee voting, forbidding the red flag, regulating the use of aircraft, and reorganizing the executive and administrative functions of the State. In 1921 a daylight-saving law was passed, a State boxing commission was created, and the workmen's-compensation law was amended. In 1921 the Legislature amended the laws relating to the employment of minors and to automobiles. It also provided for systems of relief for neglected, dangerous, or uncontrollable feeble-minded persons. In 1922 the Legislature created a State commission of administration and finance, revised the State banking laws, and amended the election laws. In 1923 a measure was passed centralizing the personnel and financial side of the Government under a commission of four, in which is a comptroller's bureau, a budget bureau, a purchasing bureau, and a bureau of personnel. A law to render provision against motor-vehicle liability compulsory was enacted in 1926. The poor-debtor law was made more formidable in 1927. State Attorney General Reading was impeached in 1928 for accepting an improper fee, and resigned.

Political and Other Events. Elections for State officers have been held biennially since 1920. Formerly, annual elections were held. In 1914 Governor Walsh, Democratic candidate, was elected, while the Republicans were successful in winning the minor State offices. The Cape Cod Canal was formally opened in July 29, 1914. On June 25, 1914, a fire destroyed a large part of the city of Salem, causing a loss of about \$12,000,000. In 1915 Samuel W. McCall, Republican, was elected governor, and Calvin Coolidge was elected lieutenant-governor. A woman-suffrage amendment submitted to the people was defeated by a large majority. In

1916 Governor McCall and Senator Henry Cabot Lodge were reelected. In the presidential voting, Hughes won 278,765 votes; Wilson, 247,845. Governor McCall was elected for a third term in 1917. In 1918 the Democrats elected former Governor Walsh to the United States Senate. Calvin Coolidge was elected governor. Governor Coolidge was reelected in 1919 and again in 1920. A strike of the Boston police, in September, 1919, gave rise to disorders. A movement had been carried on for the unionization of the police force. Commissioner of Police Edwin U. Curtis denied the right of the police to join a labor union. He was strongly upheld in this stand by Governor Coolidge. The police abandoned their posts, a night of rioting ensued, and the militia was called out. No striking officer was reinstated. In the presidential election of 1920, Warren G. Harding received 681,153 votes and James M. Cox 276,691, and Governor Coolidge became Vice President. The Republicans in 1921 elected Channing H. Cox governor. Henry Cabot Lodge was reelected to the Senate, but by a greatly reduced majority. During the summer of 1921, a pageant celebration was held at Plymouth commemorating the Pilgrim Tercentenary. On Apr. 13, 1922, the Supreme Court held that women were eligible for any State office. Governor Cox was reelected in 1923. The historic Washington elm in Cambridge was cut down on Oct. 27, 1923. A rearrangement of the State constitution was ratified by popular vote in 1919. The vote for President in 1924 was: Coolidge, 703,489, Davis, 280,831. Alvan T. Fuller, Republican, was elected governor in 1924 and in 1926. Several years of textile industrial depression caused hardship in the State. A textile strike of some months occurred in New Bedford in 1928. In 1927 the execution of Sacco and Vanzetti, two radicals charged with robbery and murder, was carried out. In 1928 the presidential vote was Hoover, 775,566; Smith, 792,758. Frank G. Allen, Republican, was elected governor.

MASSACHUSETTS AGRICULTURAL COLLEGE. A State institution for agricultural training, founded at Amherst, Mass., in 1867. The number of students enrolled in the four-year college course in 1914 was 526, and increased to 600 in 1928-29, whereas the enrollment in short courses decreased from 936 to 242 in the same period. The number of faculty members increased from 56 to 100 in 1928 and there was a summer session in the latter year with an enrollment of 165. The number of volumes in the library increased from 45,000 to 85,000 and the annual State appropriations from \$317,746 to \$958,000, with an additional Federal appropriation in 1928 of \$181,000. The curriculum of the college affords major work in agriculture, horticulture, physical and biological sciences, social science, and home economics. President, Roscoe W. Thatcher, D. Agr., LL.D.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. A nonsectarian institution for technical education at Cambridge, Mass., founded in 1861. In 1916 it was moved from its old quarters in Boston to a group of new buildings in Cambridge, facing the Charles River and having 800 rooms. The enrollment of students increased rapidly during the period under review, with the exception of the War years, from 1816 students in 1914-15 to 2868 in the autumn of 1928, including in the latter year, 412 graduate and 45 unclassified students. The

registration in the summer session of 1928 was 1414. The teaching staff of the Institute was increased during the same period from 268, to 215 faculty members, and 272 others, and the library from 120,000 to 260,000 volumes. Between 1914 and 1923-24, more than \$14,000,000 was added to the endowment, which was \$3,049,975 in the former year and had risen to \$29,800,000 in 1928. The income in 1927-28 was \$3,050,000, and the book value of the land and buildings in Boston and Cambridge was \$13,453,000. Of the additions to endowment between 1914 and 1928, \$6,500,000 was a gift from George Eastman. The School of Naval Architecture was built from funds bequeathed to the Institute by C. H. Platt prior to the War. In 1924-25 the campus was enlarged through the purchase of 30 acres of land adjoining it, while important additions to the plant in 1928 included an infirmary, two dormitories, and the Guggenheim Aeronautical Building. In 1917-18 army and navy schools of aeronautics and a school for aeronautical engineers were maintained for the Federal government; a school for deck officers was opened by the United States Shipping Board; and in 1925-26 regular four-year courses leading to the degree of Bachelor of Science were established in aeronautical engineering, and in building construction. Richard Cockburn MacLaurin, LL.D., was president until his death in 1920, and was succeeded by Ernest Fox Nichols, LL.D., who resigned in the following year, because of ill health. President, Samuel Wesley Stratton, D. Eng, Sc.D, Ph.D., LL.D.

MASSEY, THE RT HON WILLIAM FERGUSON (1856-1925). A New Zealand statesman and premier (1912-25), born in Limavady, Ulster, Ireland. In 1870 he joined his parents in New Zealand and became a farmer. He was soon active in local political life and in 1894 he entered the New Zealand Parliament as a Conservative. He was leader of the opposition from 1903 to 1912, when he became Prime Minister, and also at various times Minister of Finance, Railways, Lands, Labor, Agriculture, Industries, and Commerce. During the World War, he was a member of the Imperial War Cabinet (1917-18), and organized a system of commandeering and conscription which placed all the resources of the Dominion at the disposal of the Empire. By rigid economy, not always popular, he was able to relieve the post-war depression. He was a delegate to the Peace Conference in Paris, 1919, and to the Imperial conferences in London (1921 and 1923). He wrote various pamphlets on miscellaneous subjects.

MASSEY, VINCENT (1887-). A Canadian diplomat. He was born at Toronto and was educated at St. Andrews College, the University of Toronto, and Balliol College, Oxford (B.A., 1913). For two years (1913-15), he lectured in modern history at the University of Toronto. During the World War, he was in charge of musketry training in Military District No 2. In 1918 he was associate secretary of the War Committee of the Dominion Cabinet. He was also general secretary and later director of the Repatriation Committee. In 1919 he entered business at Toronto. He joined the Dominion Cabinet as Minister without Portfolio in 1925, and attended the Imperial Conference at London in 1926 with the Canadian delegation. Since 1926 he has been Canadian Minister in Washington. In June, 1929, he received the honorary degree of LL.D. from Columbia University.

MAST, SAMUEL OTTMAR (1871-). An American zoölogist born in Washtenaw County, Mich., and educated at Michigan and Harvard universities. He was professor at Hope College (1899-1908); associate professor and professor at Goucher College (1908-11); and associate professor and professor at Johns Hopkins University (1911-). Professor Mast published numerous articles in journals, mainly on animal reactions, as well as *Structure and Physiology of the Flowering Plants* (1907) and *Light and the Behavior of Organisms* (1911).

MASTERS, EDGAR LEE (1869-). An American writer, born in Garnett, Kan. He was educated at Knox College in Illinois and for a time studied law. His first book of poems was published in 1898 and was followed by several others. He attracted wide attention only after the publication of *Spoon River Anthology* in 1915. This was one of the most sensational books of verse published in many years. He wrote *Songs and Satires* (1916); *The Great Valley* (1916); *Toward the Gulf* (1918); *Starved Rock* (1919), *Mitch Miller*, a novel (1920); *Open Sea* (1921), *The Aupital Flight* (1923), *New Spoon River Anthology* (1924); *Lee, a Dramatic Poem* (1926); *Jack Kelso* (1928). He was a member of the National Institute of Arts and Letters.

MATERNITY PROTECTION. Alarmed at the lack of safeguards for the protection of expectant mothers and at the high infant and maternal death rates, public health workers had for many years been urging the Federal government to undertake a programme of health education. After three years of intensive effort, the Sheppard-Towner Act was passed in 1921 "to promote the welfare and hygiene of maternity and infancy." The act appropriated annually to each State accepting its provisions the sum of \$5000 outright, with an additional \$5000 if matched from the State's own funds, while a still further sum was to be apportioned on the basis of population when matched by State appropriations. The administration of the law was placed in the hands of the Children's Bureau.

Before the end of 1921, Delaware, Minnesota, New Hampshire, New Mexico, and Oregon had accepted the provisions of the act; by 1928, 45 States and Hawaii were cooperating by matching Federal grants. (Connecticut, Illinois, and Massachusetts were not participating). The 1922 Federal appropriation for the work was \$477,500, by 1928 the appropriation had reached the figure of \$919,075.78. Under the guidance of the workers of the Federal Children's Bureau, local and State units were led in a multitude of activities, including the holding of prenatal and child-health conferences, the establishment of permanent health centres, the instruction of midwives and county nurses, the holding of lectures, demonstrations, and clinics, the founding of nursery schools, etc. In Indiana alone, for example, up to June 30, 1927, a total of 800 classes for expectant mothers had been held and every county in the State had been reached.

There is no doubt that this intensive propaganda campaign contributed mightily toward the lowering of the infancy death rate. In 1922, for every 1000 live births, 76 babies died before reaching the age of one year; in 1926 the number of deaths was 73 out of 1000; by 1927 it had dropped to 65. Deaths from puerperal causes have not yet decreased markedly and, in this

sense, the United States has a higher death rate than have all the countries for which statistics are available (New Zealand, Australia, Netherlands, Irish Free State, Belgium, Chile, England and Wales, Finland, Hungary, Japan, Northern Ireland, Scotland, and Uruguay). In 1921 the maternal death rate per 10,000 live births was 68.2; in 1925 it was 64.7. The Children's Bureau believed, however, that there was cause for optimism in view of the slowly declining death rate in the rural areas. Nevertheless, in 34 States in 1927, for example, the maternal death rate decreased in 16, as compared with the previous year, when it was stationary in 2 and increased in 12. What are the reasons for high maternal death rates? The Children's Bureau cites these: isolation, untrained midwifery, lack of appreciation of the importance of prenatal care, inadequate hospital facilities, and poor technique in hospitals. Social workers have agreed that it would be a misfortune to have this campaign in health education stop just when its benefits were becoming apparent, but the Senate already has approved the termination of the operations of the Sheppard-Towner Act as of June 30, 1929.

MATHEMATICAL PHILOSOPHY. See PHILOSOPHY

MATHER, FRANK JEWETT, JR (1868-). An American art critic and professor (see VOL. XV). Since 1922 he has been director of the Princeton University Art Museum. His more recent writings include *Estimates in Art* (1916) *The Portraits of Dante* (1921); *A History of Italian Painting* (1923); *Ulysses in Ithaca* (1926); *Modern Painting* (1927), "The American Spirit in Art," in *The Pageant of America* (1927). He became joint editor of *Art Studies* in 1923.

MATHER, STEPHEN TYNG (1867-). An American public official. He was born at San Francisco, graduated from the University of California (1887), and for six years was on the staff of the *New York Sun*. From 1894 to 1903, he was Chicago manager of the Pacific Coast Borax Company, later becoming president of the Sterling Borax Company. He served as assistant to the Secretary of the Interior (1915-17) and as director of the National Park Service (1917-29). While administering the Park Service, he actively promoted general knowledge of, and interest in, the national parks. His work in this field was successful and led to the development of the National Parks.

MATHEWS, ARTHUR FRANK (1860-). An American painter and teacher, born in Wisconsin, and educated at the schools of San Francisco and Oakland, Calif. He studied art in Europe for five years, part of the time in Paris under Gustave Boulanger. He also made a study of architecture. His work included the reorganization of the California School of Design, where he was art director from 1890 to 1906. He exhibited in the leading art centres of Europe, including the Paris Exhibition and the Salon, and at leading galleries in the United States; his work appears in permanent collections at the Metropolitan Museum, where he has "California Landscape," at the State Capitol at Sacramento, Calif., the Oakland Library at Oakland, Calif., and the Masonic Temple in San Francisco. He also executed four triptychs for the University of California Library. He was awarded the medal of the American Institute of Arts in 1923 for mural painting.

MATHEWS, JOHN ALEXANDER (1872-). An American metallurgist, born at Washington, Pa., and educated at Washington and Jefferson College, Columbia University, and in London at the Royal School of Mines and as a Carnegie Research Scholar at the British Steel and Iron Institute. He was metallurgist with the Sanderson Brothers Steel Company (1902-08) and thereafter was general manager and president of the Halcomb Steel Company until 1920, when he became president of the Crucible Steel Company of America for three years. Since 1923 he has been vice president and director of research. He is an accepted authority on the metallurgy of iron. He directed his attention to alloy steels, especially electric furnace steel processes. Dr. Mathews received the first award of the Andrew Carnegie Gold Medal for Research in 1902 and was a member of the United States Assay Commission in 1900, 1905, and 1911.

MATISSE, ma'tēs', HENRI (1869-). A French painter (see VOL. XV). His later works include "Three Women on the Sea" (1914), in the Hague museum; "Sisters" (1916); and "The Odalisque" (1920). See PAINTING, under FRANCE.

MATSUDAIRA, TSUNEO (1877-). A Japanese diplomat, born in Tokyo. He graduated in economics from the Imperial Tokyo University, entered the diplomatic service, and served as legation and then embassy secretary at Peking, London, and Paris. Later, he was Consul General at Tientsin, China, and in charge of the diplomatic affairs of the Siberian Expedition of 1918-19. He then became director of the Europe-America Bureau of the Japanese Foreign Office, represented his country at the Russo-Japanese negotiations at Changchung in 1922, was Vice Minister (1924-25), and served as Ambassador to the United States from 1925 to 1928, when he was transferred to the London Embassy.

MATSUI, BARON KEISHIRO (1868-). A Japanese diplomat, born at Osaka and educated at the Imperial Tokyo University. He served as secretary of legations and embassies at Seoul, Washington, London, and Peking, and as counselor at Paris and Washington; was Vice Minister of Foreign Affairs (1913); Ambassador to Paris (1914-20), and a Japanese representative at the Paris Peace Conference; Minister of Foreign Affairs in the Kiyoura cabinet, and Ambassador to London (1925-28). He was created a peer in 1920 for his services during the World War, and sat as a Crown member of the House of Peers.

MATTER, THEORIES OF. See CHEMISTRY; PHYSICS

MAUCLAIR, mō'klār', CAMILLE (1872-). The pseudonym of Camille Faust, a French poet, critic, and novelist (see VOL. XV). His later works include *Le vertige allemand* (1916); *Les héros de l'orchestre* (1919); *Princes de l'esprit*, essays (2 ed., 1920); *Paul Adam* (1921); *Histoire de la musique européenne, 1850-1914* (1921); *Scritture et grandeur littéraires* (2 ed., 1922); *Un peintre hollandais contemporain, Antoon van Welle* (1924); *Claude Monet* (trans., 1924); *Le génie d'Edgar Poe* (1925); *Les musées d'Europe: Le Luxembourg* (1927); *Florence* (trans., 1927); and *Baudelaire in the Vie Amoureuse* series (1928). With J. F. Buchor, he wrote *Aessie* (1923) and *Versailles* (1926), both illustrated by David Burnand.

MAUGHAM, WILLIAM SOMERSET (1874-). A British novelist and playwright, who was educated at King's School, Canterbury, and

at Heidelberg. Although he never practiced, he took his M.D. degree at St. Thomas's Hospital, in one of the poorest sections of London. *Liza of Lambeth* (1897), his first novel, was a realistic sketch of some of the inhabitants of this quarter. His novels include *The Making of a Saint* (1898); *Mrs. Craddock* (1902); *The Explorer* (1907); *Of Human Bondage*, the history of a club-footed boy (1916); *The Moon and Sixpence* (1919); and *The Painted Veil* (1925). He also wrote sketches of his travels, such as *The Land of the Blessed Virgin* (1905) and *On a Chinese Screen* (1922). His plays include *A Man of Honor* (1904); *Lady Frederick* (1907); *Caroline* (1916); *The Circle* (1921); *East of Suez* (1922); *Our Betters* (1923); *The Letter* (1927); and *The Constant Wife* (1927). Consult W. Somerset Maugham, *Novelist, Essayist, Dramatist*, by Charles Hanson Towne and Carl and Mark van Doren (1925).

MAURIAC, FRANÇOIS (1885-). A French novelist who made his debut with a volume of religious verse which Barrès and Bourget called a revelation, and then was poetry critic for the *Revue du temps présent* (1910). The character analysis, which established his reputation as a writer, was not visible in his earlier novels, but appeared first in *Le baiser du lépreux* (1922) and *Genitrix* (1924). His other works include *Les mains jointes*, poetry (1910); *L'adieu à l'adolescence* (1911); *L'enfant chargé de chaînes* (1913); *La robe prétexte* (1914); *La chair et le sang* (1920); *Préséances* (1921); *La fleur de feu* (1923); *Le désert de l'amour* (1925); *Orages*, poems (1925); *La province*, miscellaneous (1926); *Le jeune homme* in the series *Les ages de la vie* (1926); *Thérèse Desqueyroux* (1927); *La vie de Jean Racine* (1928); *Destins* (1928, Eng. tr., 1929); *Essai sur le roman* (1928); and *The Desert of Love* (1929).

MAURITIUS. An island British Crown colony situated in the Indian Ocean 500 miles east of Madagascar. The area of the whole colony, which includes several small islands, is 720 square miles; the population in 1921 was 385,074, of which Indians and Indo-Mauritians numbered 265,884 and Chinese 6820; the estimated population at the end of 1927 was 401,693. The capital and chief port, Port Louis, had 54,114 inhabitants in 1927. Sugar raising continues to engage almost the whole population. The sugar export in 1912 amounted to 206,677 metric tons; in 1919, it reached 302,826 tons, in 1921-22 it was 182,234 tons; in 1926, 233,000 tons. Aloe fibre and copra are the other exports. Total exports for 1913 and 1927 were £2,241,084 and £3,774,203. Total imports for 1913 and 1927 were £2,466,800 and £3,679,042. Imports included, in the order of their value for 1927, cotton goods, machinery, iron and steel manufactures, ammonium sulphate, etc. In 1927, 450 vessels of 1,248,460 tons entered and cleared. In 1910, the tonnage had been 986,000. During the World War, the entire sugar crop was purchased by the British government at the prevailing high prices with the result that prosperity in the island was unexampled. This continued after the War and through the world-wide depression of 1920-21. Revenues for 1913-14 and 1926-27 were £742,846 and £978,854; expenditures, £681,098 and £1,097,404. On June 30, 1926, the colonial debt was £1,756,724. In 1927 the municipal debt of Port Louis, contracted for harbor improvements in 1920, was £63,420. Accounts

are kept in rupees, and conversions have been made at the nominal exchange rate of Rs.15 = £1. The colony continues peaceful under British rule. The agitation of the Creoles for the return of the island to France in 1919 was short-lived, the continued prosperity stilling all dissent.

MAUROIS, ANDRÉ (1885-). The pseudonym of Émile Herzog, a French writer who was born at Elbeuf and educated at the Lycée of Rouen. He spent a great deal of time in England, and during the World War was a liaison officer with the British Army, his first books, *Les Silences du Colonel Bramble* (1918) and *Les Discours du Docteur O'Grady* (1920), being sympathetic and amusing accounts of the soldiers he knew during the War. He continued as an interpreter of the English to the French in *Arel, ou la vie de Shelley* (1923), which made his reputation; *La vie de Disraeli* (1927); and *Études anglaises, essays* (1927). In France, he popularized and remained one of the outstanding writers of the so-called interpretive biography. Nearly all of his books were translated into English. His other works include *Dialogues sur le commandement*, translated as *Captains and Kings* (1925), *Meupe* (1926); *Bernard Quesnay*, a semi-autobiographical story (1926); *Rouen*, in the Portrait de France series (1927); *Petite histoire de l'espèce humaine* (1927); *The Next Chapter; The War against the Moon*, fictitious accounts of war (1927); *Voyage au pays des Articoles* (1928); two novels, *Ni Ange ni bête* (1928) and *Climats* (1928), and *Aspects of Biography* (1929). In the autumn of 1927, he came to America, lectured on the novel at Princeton University and made a tour as the official speaker of the Alliance Française. In 1928 he delivered a series of lectures on English subjects, which were subsequently published, at Trinity College, Cambridge, England.

MAURRAS, mō'ra', CHARLES (MARIE PHOTIUS) (1868-). A French critic and journalist (see VOL. XV), codirector, with Léon Daudet, of the Nationalist journal, *Action Française*. His later works include *Les Conditions de la victoire*, collected war articles (4 vols., 1914-16); *L'étang de Barre* (1915), *La Part du Combattant* (1917); *Athènes antique* (1918); *Les trois Aspects du Président Wilson* (1920); *Pour Psyché*, verse (1920); *Inscriptions*, poems (1921); *Les nuits d'épreuve et la mémoire de l'état* (1923), *La France veut-elle un roi?* (1925); *La musique intérieure*, one of his most important contributions to literature, partly verse and partly autobiographical (1925); *Pour en sortir* (1926); *Le maurass traité de la victoire à Locarno* (2 vols., 1928); and *Theodore Aubanel* (1928). Consult *Le victorieux XX^e siècle*, by Pierre Moreau (1925) and *Charles Maurras et le nationalisme de l'Action Française*, by Marie, Marquis de Roux (1927).

MAX, maks, PRINCE OF BADEN (1867-1920). A German statesman, born in Baden Baden. After studying law, he entered the army but retired without having seen active service. He was president of the First Chamber of the Baden Diet from 1907 to 1918. On account of the fact that he was not identified particularly with any prominent party, he was chosen chancellor on Oct. 3, 1918. During the consideration of the armistice proposals made by the Allies on November 9, he issued a formal declaration of the abdication of the Kaiser, and on the following day resigned from office. His memoirs, published in 1927, appeared in English

translation, *Memoirs of Prince Max of Baden*, in the following year. See BADEN; GERMANY.

MAXIM, HUDSON (1853-1927). An American mechanical engineer (see VOL. XV). In 1915 and during the World War, he was a member of the United States Navy Consulting Board. In 1929 a tablet, with a large boulder as a base, was unveiled to his memory in the New Jersey State Park. He published *Defenseless America* (1915) and *Dynamite Stories* (1916). *Reminiscences and Comments, as Reported by Clifton Johnson* appeared in 1924. See also *Rise of an American Inventor, Hudson Maxim*, by C. Johnson (1927).

MAXWELL, WILLIAM BABINGTON (1876-). An English novelist (see VOL. XV), chairman of the National Book Council. He served in the army throughout the World War. His later works were *The Mirror and the Lamp* (1918); *The Great Interruption* (1919); *A Man and His Lesson* (1919); *A Remedy against Sin* (1920); *A Little More* (1921); *Spinster of this Parish* (1922); *The Day's Journey* (1923); *Elaine at the Gates* (1924); *Children of the Night* (1925); *Fernande* (1925); *Life: A Study of Self* (1926); *Gabrielle* (1928); *The Case of Beran York* (1927); *We Forget Because We Must* (1928).

MAYBECK, BERNARD RALPH (1862-). An American architect, born in New York City. He studied architecture in Paris and at the University of California. From 1892 to 1900, he was instructor in drawing, descriptive geometry, and architecture at the University of California. In 1899-1900 he was dean of the department of architecture of that university. He designed buildings for the Panama-Pacific Exposition and other important structures for several towns and cities. He was associated with the United States Shipping Board during the World War and was a founder of the Council of Allied Arts.

MAYNARD, THEODORE (1890-). An American lecturer and author, born at Madras, India, and educated in India, in England, and at the Mt. Hermon School in Massachusetts. From 1909 to 1911, he resided in the United States and studied for the Congregational ministry. In 1911 he removed to England and in 1913 was received into the Roman Catholic Church. From 1921 to 1925, he was professor of English literature in the Dominican College at San Rafael, Calif. For the next two years, he had a similar chair at St. John's College, Brooklyn, N. Y., and later at the Graduate School of Fordham University, New York. He wrote *Drums of Defeat* (1916); *Folly and Other Poems* (1918); *The Last Knight* (1921); *The Divine Adventure* (1921); *Our Best Poets* (1922); *The Book of Modern Catholic Verse* (1926); *The Book of Modern Catholic Prose* (1927); *Exile and Other Poems* (1928). In 1916 he was the winner of the Malory Prize offered in London for the best volume of poetry.

MAYNC, HARRY (1874-). A German writer, born in Berlin, who studied at the universities of Berlin and Leipzig. He was made editor of the German classics published by the Bibliographisches Institut of Leipzig and lectured at the University of Marburg. He later became director of the Seminary of the University of Berne. He is the author of *Uhlands Jugendgedichte* (1899); *Eduard Moricke: Sein Leben und Dichten* (1901); *Die Altheutschen Fragmente von König Tirol und Fridebrand* (1910); *Wilhelm Meisters Theatralische Sen-*

dung (1910); *Dichtung und Kritik: eine Rechtfertigung der Literaturwissenschaft* (1912); *Lilienorion* (1919); *Fontane* (1920); *Immermann: Leben und Werke* (1921); *Die Schweiz im deutschen Geistesleben*, vols. 1 to x (1922-27); *Sprache und Dichtung*, in 40 vols. (1910-27). He also edited the works of Uhland, Mörike, Goethe, Immermann, Gottfried Keller, Fontane, and Albrecht von Haller.

MAYO, KATHERINE (?-). An American author, born at Ridgeway, Pa., and educated at private schools in Boston and Cambridge, Mass. She wrote *Justice to All*, a history of the Pennsylvania State Police Force (1917); *The Standard Bearers* (1918); *That Damn Y* (1920); *Mounted Justice* (1922); *Isles of Fear* (1925); *Mother India* (1927), and *Slaves of the Gods* (1929).

MAYO, CHARLES HORACE (1865-). See MAYO, WILLIAM JAMES.

MAYO, WILLIAM JAMES (1861-). An American surgeon (see VOL. XV). The most momentous event in the history of the Mayo Clinic at Rochester, Minn., occurred in 1915, when W. J. and C. H. Mayo donated \$2,000,000 to establish the Mayo Foundation for Medical Education and Research in affiliation with the University of Minnesota. In 1928 a \$3,000,000 clinic was added to the \$5,000,000 plant. The Mayo Clinic was then functioning as the graduate organization for the University of Minnesota Medical School and was treating 60,000 patients annually. During the World War, W. J. Mayo was made chief surgical consultant to the Medical Corps, United States Army, with the rank of colonel. C. H. Mayo was made associate consultant in surgery at the same time.

MAYR, RICHARD (1877-). An Austrian dramatic baritone, born in Henndorf, near Salzburg. While pursuing his medical studies at the University of Vienna, he also studied singing at the Conservatory (1898-1902) and sang in the chorus of the Akademische Gesangsverein. The exceptional quality of his voice began to attract attention and he received offers of engagements from several provincial theatres, which he resolutely declined, determined to make his first appearance only in a principal rôle at a principal theatre. His opportunity came in the summer of 1902, when he made his début as Hagen in *Götterdämmerung* at the Bayreuth Festival, with such success that Mahler immediately secured him as a permanent member of the Hofoper at Vienna. Here he disclosed an astonishing versatility, both as a tragedian and comedian of the first rank, equally great as a singer and an actor. Before long, he was recognized also as one of the greatest of living Liedersingers. During 1908-14 he sang every summer at the Bayreuth Festival. He made his London début as Ochs von Lercheau in *Der Rosenkavalier* at Covent Garden (May 23, 1924), and his American début at the Metropolitan Opera House as Pogner in *Die Meistersinger* (Nov. 2, 1927).

MAYRHOFER, mîr'hô'fêr, JOHANNES (1877-). A German Roman Catholic writer of fiction, drama, and travel, born at Hamburg, and educated in philosophy and æsthetics at the universities of Berlin and Münster. He wrote the plays *Der König von Granada* (1902); *Seleukus und Stratonike* (1904); and the novels *S. J., ein Jesuitenroman* (1916); *Der Kaiser des Sonnengottes* (1917); *Dilettanten der Liebe* (1919), and *Konnorsreuth* (1926). He also published

essays or biographical works on Kant (1911), Schopenhauer (1912), Jens Peter Jacobsen (1914), and translations from Jörgenson and Svensson.

MEAD, ALBERT DAVIS (1869-). An American biologist and college executive, born at Swanton, Vt., and educated at Middlebury College and Brown, Clark, and Chicago Universities. He was instructor in comparative anatomy (1895-96), associate professor (1895-1901), and professor of comparative anatomy (1901-09) at Brown University. He became professor of biology in 1909. Since 1925 he has been vice president of the University. Professor Mead published articles on the natural history of marine invertebrates and on the artificial culture of marine food animals.

MEAD, CHARLES LAREW (1868-). An American bishop, of the Methodist Episcopal Church, born at Vienna, N. J., and educated at New York University. In 1895 he was ordained to the Methodist Episcopal Ministry and, from 1895 to 1920, served as pastor in churches in New Jersey, Maryland, New York, and Colorado. He was ordained bishop in 1920. During the World War, he served with the Y. M. C. A. in France.

MEAD, ELWOOD (1858-). An American engineer and rural sociologist. Born at Patriot, Ind., he was graduated at Purdue University, and held a professorship in Colorado Agricultural College (1883-84 and 1886-88). From 1888 to 1899, he was Territorial and State Engineer of Wyoming. He served as chief of irrigation and drainage investigation for the U. S. Department of Agriculture (1897-1907), was professor of irrigation in the University of California (1898-1907), and then went to Australia as chairman of the Victoria State Rivers and Water Commission (1907-15). He returned to California as professor of rural institutions in the State University (1915), and chairman of the Land Settlement Board. In 1924 he was appointed commissioner of reclamation by President Coolidge. He is also head of the American section of the International Water Commission (United States and Mexico). He strongly advocated the Boulder Canyon Dam project, the construction of which is under his direction. He is the author of *Irrigation Institutions* (1903); *Helping Men Own Farms* (1920); and many official reports on irrigation and allied topics.

MEASLES. Beginning with 1916, studies were prosecuted in several countries which resulted in the possibility of immunizing children against measles. Natural insusceptibility to this disease is as good as nonexistent; and as it destroys 10,000 lives annually in the United States, much salvage of life may result from wholesale immunization. On account of the long incubation period, it is possible to prevent the disease after the child has been exposed, and immunization should of course be practiced as soon after exposure as possible. The immunizing substance is ideally the whole blood or plasma of a person who has recently recovered from measles. About a pint of blood may be taken at a time, and it is possible to preserve it for six months; but in case of epidemics, sufficient blood may be difficult to obtain. It is necessary, as in blood transfusion, to be sure that the blood donor is healthy. The individual immunizing injection is small in amount, about 2.5 cubic centimeters. This is called the immunizing unit. If great haste is expedient and no blood is available, it may be taken from a

parent and injected directly into the muscles. Immunization will have three consequences. In a few cases, it will fail and the patient will have typical measles. In other cases, the child will develop modified measles, a very mild form. Finally, and in the majority of cases, it will escape the disease altogether. To show what may be done under favorable circumstances, Zingher of the New York City Health Department secured 90 per cent complete immunity in one large series of cases treated in this way.

The status of our knowledge of the serum treatment of this affection is well covered in an article by A. C. Silverman of Syracuse in the *Journal of the American Medical Association* for Dec. 8, 1928. Great care is necessary in obtaining, preserving, and distributing the serum which should be taken only from otherwise healthy adults with true and uncomplicated measles during the 7-10th day following defervescence. The maximum amount of blood drawn should be about 500 cubic centimeters, and the donor is paid from \$10 to \$25, depending on the amount taken. Phenol is used as a preservative and the serum is bottled ready for use in 4.5 cubic centimeters doses. Distribution to physicians is free, but these are obliged to send in return blanks properly filled out. In a recent Syracuse epidemic, about 7000 cubic centimeters of serum were obtained from 21 donors at a cost of \$430. In about 16,000 cases during the serum period, the total deaths were 48—a mortality of twenty-eight one-hundredths of 1 per cent. The usual death rate is anywhere from thirty-nine one-hundredths of 1 per cent up to more than 11 per cent. The real efficacy of the serum should be in warding off broncho-pneumonia, the chief cause of death, and here other factors must naturally enter.

MEDICAL PROGRESS. The theory and practice of medicine and surgery have made great advances since the World War, which afforded the widest opportunity for the practice of military surgery and for the prosecution of hygienic and sanitary measures under military conditions. In certain cases, enforced sanitation was practiced among the civil population which came under military authority or where the people generally were governed more directly than usual in the stress of War circumstances. Naturally, there was some relaxation of the efforts of research hospitals and the devotees of experimental medicine in their laboratories; but, after the termination of hostilities, these and other agencies attacked their various problems with redoubled vigor, besides investigating questions raised by the War itself. At no time in the history of the world has medical research been better organized, with more coöperation among the institutions concerned, or with more good will of the general public. For discussions of the fields in which progress has been most notable and results most interesting, see ABORTION; ADRENALIN; ANÆMIA; ANGINA PECTORIS; ANTHRAX; BIOCHEMISTRY; BIRTH CONTROL; BLOOD PRESSURE; BOTULISM; BUBONIC PLAGUE; CAN-

MEEKER, EZRA (1830-1928). An American pioneer and author. He was born at Huntsville, Ohio, and was self-educated. In 1852, with his wife and child, he crossed the plains and mountains with an ox team by the Oregon Trail to the Pacific Northwest. He was a farmer in Washington (Territory and State) for 50 years. In 1906 he returned to Washington, D. C., with an ox team, retracing much of the original route of 1852. He later traveled the same route by automobile and airplane. He was the author of *Washington Territory West of the Cascade Mountains* (1870); *Hop-Growing in the United States* (1883); *Pioneer Reminiscences of Puget Sound* (1905); *The Oregon Trail* (1907); *Eighty-five Years of a Busy Life* (1916); *Seventy Years of Progress in Washington* (1921); *Ox-Team Days* (1922); and *Kate Mulhall* (1926).

MEEKS, EVERETT VICTOR (1879-). An American architect and University professor, born in Mt. Vernon, N. Y., and educated at Yale, at the School of Architecture of Columbia, and in Paris. For several years, he was associated with Carrère & Hastings, but after 1914 practiced alone. He was acting professor of architecture at Cornell from 1914 to 1916, and from 1916 he was on the faculty of the School of Fine Arts at Yale as head of the department of architecture. During the World War, he was assistant director of fine arts of the Army Overseas Educational Commission.

MEES, CHARLES EDWARD KENNETH (1882-). An American photographic research scientist. He was born at Wellingborough, Eng., and studied at Kingswood School, Harrogate College, St. Dunstan's College, and the University of London (B Sc., 1903). He was managing director of Wratten and Wainwright, Ltd., Croyden, Eng. (1906-12), and since 1912, when he came to the United States, he has been director of the Research Laboratories of the Eastman Kodak Company, at Rochester, N. Y. He is the author of *Photography of Colored Objects* (1909); *An Atlas of Absorption Spectra* (1909); *The Organization of Industrial Scientific Research* (1920); *The Fundamentals of Photography* (1920); and coauthor of the *Theory of the Photographic Process* (1907).

MEGGERS, WILLIAM FREDERICK (1888-). An American physicist, born at Clintonville, Wis. He studied at Ripon College and at Wisconsin and Johns Hopkins universities. He was instructor in physics at Ripon and at Wisconsin, after which he was connected with the Carnegie Institute of Technology (1912-14). In 1914 he became physicist to the Bureau of Standards. Dr. Meggers made special researches on topics connected with spectroscopy, astrophysics, photography, and measurements of standard wave lengths. On all these subjects, he has published

articles in technical journals and in the publications of the Bureau.

MEGRUE, ROY COOPER (1883-1927). An American playwright, born in New York City, and educated at Columbia University. He wrote a great many successful plays, including *Under Cover*, with W. Hackett (1913); *It Pays to Advertise* (1914); *Under Fire* (1915); *Potash and Perlmutter in Society*, with Montague Glass (1915); *Seven Chances* (1916); *Under Sentence*, with Irvin S. Cobb (1916); *Where Poppies Bloom* (1918); *Tea for Three* (1918); *Honors are Even* (1920); and *Venice For Two* (from the French of Sacha Guitry, 1925).

MEIGHEN, THE RT. HON. ARTHUR (1874-). A Canadian public official, born at St. Mary's in western Ontario, and educated at Toronto University. For a short time he taught school. He then moved to Winnipeg, where in 1903, after studying law, he was admitted to the bar. In 1908 he was elected as a Conservative to the Dominion Parliament and soon gained a reputation as a debater. He was reelected in 1911 and two years later was appointed Solicitor General. In 1915 he became a member of the Privy Council, and on the reorganization of the Cabinet in 1917, with a coalition membership, he was made Minister of the Interior; this post he retained until his appointment as Premier, in 1920, succeeding Sir Robert Borden. He also held the office of Secretary for External Affairs. He remained in office until the defeat of his Government in 1922. He was again Premier for a brief period in 1926, but was defeated for reelection to Parliament in that year and became vice president of, and general counsel to, Canadian General Securities, Ltd. In 1918 he was a member of the Imperial War Cabinet. He was made a Privy Councillor in 1920.

MEIKLEJOHN, mlk'1-jön, ALEXANDER (1872-). An American educator (see VOL. XV). He continued as president of Amherst College until 1924, when because of opposition to his methods on the part of a majority of the faculty and of the older alumni, his resignation was requested and accepted by the trustees. He was called to the University of Wisconsin as professor of philosophy, and in 1927 an experimental college was inaugurated there under his direction. He is the author of *The Liberal College* (1920), and *Freedom and the College* (1923). See UNIVERSITIES AND COLLEGES.

MEILLET, mǎ'yâ, ANTOINE (1866-). A French Orientalist (see VOL. XV). His later works include *Grammaire du vieux Persé* (1915); *Caractères généraux des langues germaniques* (1917); *Les Langues de l'Europe nouvelle* (1918); *Linguistique historique et Linguistique générale* (1921); *Grammaire de la Langue Polonaise*, with Mme. de Willman-Grabowska (1921); *Introduction à l'Étude Comparative des Langues Indo-Européennes* (5 ed. revised and augmented, 1922); *Grammaire de la langue Serbo-Croate*, with A. Vaillant (1924); *Le slave commun* (1924); *Trois conférences sur les gâthâ de l'Avesta* (1925), and *La méthode comparative en linguistique historique* (1925). With M. Cohen, he edited *Les langues du monde* (1924).

MEINECKE, FRIEDRICH (1861-). A German historian. He was born at Salzwedel, studied at the Universities of Berlin and Bonn, and worked on the Prussian archives (1887-91). He was lecturer at the University of Strassburg (1896-1901), then at Freiburg, and in 1914 at

Berlin again. He is the author of *Von Stein zu Bismarck* (1908); *Das Zeitalter der Deutschen Erhebung, 1795-1815* (1913); *Redwitz und die Deutsche Revolution* (1913); *Die Deutsche Erhebung von 1914: Probleme des Weltkriegs* (1917); *Weltbürgertum und Nationalstaat* (1919); *Nach der Revolution* (1919); *Idee der Staatseraision in der neueren Geschichte* (1925); and *Geschichte des deutschenglischen Bündnisproblems* (1927).

MEINHART, min'härdt, RODERICH (1892-). An Austrian writer. The son of Adam Muller Guttenbrunn, the novelist, he was born at Vienna, studied history and art at the university there, and became literary adviser to several publishing houses. He is the author of *Nach der Heimat Mocht' Ich wieder* (1920), *Die am Wege Blieben* (1920); *Untergang*, a play (1920); *Wiener Totentanz* (1921); *Die vergessene Stadt* (1921); and *Madonna Einsamkeit* (1924). The last two are novels.

MEISTER, mi'stär, ALOYSIUS (1866-1925). A German historian, born at Frankfurt, and educated at the University of Strassburg and in Rome. He was appointed lecturer at the University of Bonn and in 1911 became professor at the University of Munster. He wrote *Die Hohenstaufen im Elsass* (1890); *Die Kölner Nuntiatur* (1895); *Die Anfänge der modernen diplomatischen Geheimschrift* (1902); *Grundzüge der historischen Methode* (1913, 3d ed. 1923); *Deutsche Verfassungsgeschichte des Mittelalters* (1907, 3d ed., 1922); *Friedrich der Grosse und das preussische Westfalen* (1912); *Studien zur Geschichte der Wachszinsigkeit* (1914); *Bismarcks Aussenpolitik um 1871* (1915); and *Der Neue Geschichtsunterricht* (1920).

MELANESIA. See ETHNOGRAPHY.

MELARTIN, ERKKI GUSTAF (1875-). A Finnish composer, born at Kexholm. He studied with Wegelius at the Helsingfors Conservatory and later under R. Fuchs in Vienna. For some years, he taught theory and composition at the Helsingfors Conservatory. From 1908 to 1911, he was conductor of the symphony orchestra in Viborg and then returned to Helsingfors as director of the Conservatory. He is one of the most important of Finnish composers. His principal works are in opera, *Aino* (Helsingfors, 1907); six symphonies, two symphonic poems, *Sukajoki* and *Traumgesicht*, three orchestral suites; a violin concerto, incidental music to *Prinsessan Torvalda* and Hauptmann's *Hanneles Hummelfahrt*, four string quartets; and choruses, piano numbers, and songs.

MELBA, mel'ba, NELLIE (1861-). An Australian coloratura soprano (see VOL. XV). For more than 20 years she made extensive tours, appearing chiefly in concert. For distinguished service during the World War, she was made Dame Commander of the Order of the British Empire in 1920. She retired to private life in 1926. She published a volume of souvenirs under the title *Melodies and Memories* (London, 1925).

MELCHETT, ALFRED MORITZ MOND, FIRST BARON (1868-). A British politician and industrialist, who was born at Farnworth, near Widnes, Lancashire, and educated at Cheltenham College, and Cambridge and Edinburgh universities. He became a barrister of the Inner Temple (1894), and was a judge on the North Wales and Cheshire circuit. He was a Liberal member of Parliament from 1906 to 1923 and from 1924 to 1926, and a Conservative member

from 1926 until his entry into the House of Lords (1928). He served in the Cabinet as First Commissioner of Works (1916-21), and as Minister of Health (1921-22). He was chairman or director of many powerful companies in varied industrial fields, including Imperial Chemicals, Ltd., a member of the Royal Institution, a Privy Councillor, president of the British Science Guild (1927-28), and president of the World Power Conference (1928). He visited the United States in 1928 and the same year was created a baron. Besides articles on politics and economics, he wrote *Questions of To-day and To-morrow* (1912); *Why Socialism Must Fail* (1923), *The Remedy for Unemployment* (1925), and *Industry and Politics* (1927).

MELCHIOR, LAURITZ (1890-). A Danish dramatic tenor, born in Copenhagen. After five years of study under Paul Bang, he made his début at the Royal Opera in Copenhagen in 1913 as a baritone, and during 1914-21 was a regular member there. At the same time, he continued to study with Bang, and after a year with Wilhelm Herold, he made his début as a tenor. The years 1921-24 were spent mainly in studying an extensive tenor repertory with Victor Beigel in London. Ernst Grenzsbach in Berlin, Anna Bahr-Mildenburg in Munich and Karl Kittel in Bayreuth. In 1924 he sang at Covent Garden and Bayreuth, the following year at the Städtische Oper in Berlin, and in 1926 made his American début at the Metropolitan Opera House as Tannhäuser (Feb. 18). Since 1927 he has been a regular member of the Stadttheater in Hamburg.

MELL, MAX (1882-). An Austrian poet and dramatist, born at Marburg. His works include *Jägerhaussage* (1910); *Barbara Naderers Viehstand* (1914); *Gedichte* (1919); *Das Apostelenspiel*, a dramatic poem (1923); *Das Schutzengelspiel* (1923); *Das Morgenwoge* (1924); and *Das Nachfolge Christi-Spiel* (1927).

MELLON, ANDREW WILLIAM (1855-). An American Secretary of the Treasury, born in Pittsburgh, Pa., and graduated at the University of Pittsburgh in 1873. He at once entered the banking firm of Thomas Mellon and Sons of Pittsburgh, in which he was soon a partner. Later, this firm developed into the Mellon National Bank, of which he became president in 1902, and the Union Trust Company and the Union Savings Bank, of both of which he was made vice president. He was long associated with H. C. Frick in the development of the coal, coke, and iron industries of western Pennsylvania and was an officer or director of many financial and industrial corporations. Mr. Mellon founded the town of Donora, Pa., established a large steel plant there, and built the first independent oil pipe line through Pennsylvania. His philanthropies were numerous, and he had much to do with the founding of Mellon Institute in Pittsburgh. In 1921 he was appointed Secretary of the Treasury by President Harding and retained that office throughout President Coolidge's administration. He was reappointed to the post by President Hoover in 1929. He won an unusually high reputation as an authority on finance. As administrator of the national finances, his chief accomplishments were the refunding of European debts, the reduction of the public debt, and in the steady paring down of federal taxation. In connection with his office, he held the chairmanship of the Federal Reserve Board, the Farm

Loan Board, the War Finance Corporation, and the World War Foreign Debt Commission. Besides his official reports, he wrote *Taxation: the People's Business* (1924).

MELSTED, mēlstēd, HENNING FINNE VON (1875-). A Swedish author (see VOL. XV). Among his later works were *Osåmja*, short stories (1915); *Folket i fongenskap*, on Belgium in German captivity (1916); *Sveriges Fara* (1916); *Ensam*, a play (1917); *Gerda* and *Mordbrannerskan*, novels (1918); *Salomos dom*, a play (1919); *Erna* (1923); *Den Stora Karnevalen* (1924), and *Skiljas* (1926), all novels.

MELTZER, SAMUEL JAMES (1851-1920). An American physiologist (see VOL. XV). During the World War, Dr. Meltzer was a major in the Medical Reserve Corps, and when the American Association for Thoracic Surgery was organized in 1918, he was elected president. Up to the time of his death, he was engaged in research along widely differing lines, notably in resuscitation by pharyngeal insufflation, injections of magnesium sulphate for anæsthesia, experimental pneumonia, etc. and published numerous reports, alone and with collaborators.

MEMEL, mēmēl This little town, with a population of 41,500 in 1910, at the mouth of the Niemen River in the southeast corner of the Baltic, became, after the World War, an important bone of international contention. As a harbor, before the War, it was comparatively insignificant; most of the trade of the region went by way of either Danzig and Königsberg, or Riga and Libau. During the War, Germany built a railway line north to Polanga, to connect at Piekuln with the Libau-Mitau Railway. By Article 99 of the Treaty of Versailles, the city and a narrow strip of territory to the southwest, containing an area of 945 square miles and a population of 150,000, were cut off from Germany and taken under the control of the Supreme Council. To German protest, the Allies replied that while the city was German, the surrounding territory was undoubtedly Lithuanian, and that possession of the port was necessary to assure Lithuanian economic independence. In view of the unsettled state of Lithuanian affairs, it was deemed advisable to send a French force to take possession of the city early in 1920 and to hold it in trust for Lithuania. The tardiness of the Allies in settling the problem goaded the Lithuanians, chafing already as a result of the loss of Vilna, to take matters into their own hands. On June 10, 1923, therefore, the so-called Committee for the Welfare of the Territory of Memel seized the city, interned the French soldiers, and after a local diet had confirmed the step, had the satisfaction of announcing that Memel had become a part of Lithuania and that the customs lines were abolished. Allied protests were unavailing; the Kovno (Lithuanian) government disclaimed all complicity or even knowledge of the affair. Up to September, 1923, negotiations dragged on between the Lithuanian government and the Council of Ambassadors and eventually ended in a deadlock because of the Lithuanian refusal to accept the machinery proposed in the draft convention for the regulation of international commerce, specifically Polish, by and through the port. Lithuania then proposed the adjudication of the matter by the Permanent Court of International Justice; the Council of Ambassadors decided, however, to submit the controversy to the League Council. Thus requested, the League

Council, late in 1923, invited Norman H. Davis, an American, and two others, to act as arbitrators. On Feb. 4, 1924, the commission set to work, and on Mar. 14, 1924, it reported to the League Council. On that day, as a result of the arbitrators' findings, three conventions were signed by Great Britain, France, Italy, Japan, and Lithuania, which, in effect, provided for the transfer of Memel to Lithuania; the establishment of the city and region as an autonomous unit with full legislative, judicial, and administrative rights; the guarantee to foreign nationals of the same rights accorded the people of Memel, the creation of a harbor board of three made up of a representative each of Lithuania, Memel, and the League of Nations; the free transit by sea, water, and rail of all hinterland traffic. In all the negotiations, a marked conciliatory spirit was displayed by the Lithuanians, and, in the opinion of Mr. Davis, they had made the fullest concessions possible. Poland, however, remained disgruntled. See LITHUANIA; POLAND.

MEMPHIS. The commercial metropolis of Tennessee. The population rose from 132,778 in 1910, to 162,351 in 1920, and to 190,200 in 1928, by estimate of the Bureau of the Census. The population of Greater Memphis in 1928 was 265,500. The area was 30 3/4 square miles. In 1924 the city created a planning commission, which prepared a major and a minor street plan and zoning system. Building activity since 1920 has included the construction of a \$3,000,000 municipal auditorium seating 12,500 persons, a new water plant with a pumping capacity of 60,000,000 gallons per day, two municipal river and rail terminals erected at a cost of \$2,000,000, the Shelby County Court House, the County Jail and Criminal Courts Building, a long viaduct across the Illinois Central Railroad tracks, a railroad bridge 4500 feet long across the Mississippi, three large hotels, nine office buildings, nine high schools, and 10 modern hospitals ranging in cost from \$100,000 to \$2,000,000. In 1927, a local estimate gave 26,063 persons employed in the 580 industrial establishments of Memphis with wages of \$30,000,000, the value of products manufactured was 180,625,000. Bank clearings in 1927 amounted to \$1,191,854,400 and building permits to \$15,094,643. The assessed valuation of property in 1927 was \$246,606,000; the net debt was \$25,462,000.

MENCKEN, H(ENRY) L(OUIS) (1880-). An American author and editor, born at Baltimore, Md. He was graduated at the Baltimore Polytechnic and at once began his journalistic career on the Baltimore *Morning Herald*. Later he came to New York and was connected with the *Evening Sun*. In 1914-23 he was an editor of *Smart Set*; since 1921 he has been a contributing editor of *The Nation*. In 1924 he undertook, with George Jean Nathan, the editorship of the new *American Mercury*. He edited the *Players' Edition of Ibsen's Plays* (1909) and *The Free Lance Books* (1919-) and is the author of *Ventures into Verse* (1901), *George Bernard Shaw, His Plays* (1905); *The Philosophy of Friedrich Nietzsche* (1908); *The Artist* (1912); *A Book of Burlesques* (1916); *In Defense of Women* (1917); *The American Language* (1918); *Prejudices* (1919-27); *On Democracy* (1926), *Treatise on the Gods* (1929). See H. L. Mencken, by E. A. Boyd, and *The Man Mencken*, by I. Goldberg (1925).

MENDELISM. See BOTANY; HEREDITY.

MENDELSSOHN-BARTHOLDY, mën'del-sön-bar-tól'dl, ALBRECHT (1874-). A German international lawyer, born at Karlsruhe. He was professor of international law at Wurzburg (1905-20), and at Hamburg from 1920 to 1923, when he became president of the newly founded Institut für Auswärtige Politik (Institute for Foreign Affairs) in that city. Since 1923 he has also been chief editor of *Europäische Gespräche*, a monthly review of foreign politics. He wrote *Grenzen der Rechtskraft* (1900); *Raumliches Herrschaftsgebiet des Straßengesetzes* (1910); *Völkerbund als Arbeitsgemeinschaft* (1918); *Grosse Politik der Europ. Kabinette* (1924-27), and *Handbuch der Politik* (1921 and 1927).

MENDENHALL, CHARLES ELWOOD (1872-). An American physicist, born at Columbus, Ohio, and educated at Rose Polytechnic Institute and Johns Hopkins University. He was an aide on the United States Coast Survey, and during 1894-95 an assistant in physics at the University of Pennsylvania, after which he was an instructor at Williams. In 1901 he accepted a call to the University of Wisconsin, where in 1905 he became full professor. His researches included studies on the absolute value of gravity, high temperature measurements, luminous efficiencies, and constants of radiation, on which he wrote important papers for various technical publications. During the World War, he was major in the science and research division of the Signal Corps and Air Service (1917-19) and chairman of the division of physical sciences in the National Research Council (1919-20). He also served as scientific attaché to the United States Embassy in London (1919). He was elected to the National Academy of Sciences and in 1923-25 was president of the American Physical Society.

MENENDEZ PIDAL, RAMÓN (1869-). The leading Romance philologist of Spain (see Vol. XV). He is the author of several important works concerning the history and literature of Spain, and mediæval literature and culture in general. He is a member, and since 1925 director, of the Royal Spanish Academy of the Language, and a member of the Royal Academy of History of Madrid. He is also a member, and medalist for Arts and Letters, of the Hispanic Society of America; and has been honored by numerous foreign academies and universities. Among the most important of his later works are *Louis Vélez de Guevara: La Serrana de la Vega* (1916, with his wife); *Antología de prosistas castellanos, Segunda ed., bastante corregida y aumentada* (1917); "*Roncesvalles*," *un nuevo cantar de gesta español del siglo XIII* (1917); *Crónicas generales de España, 3a. ed. con notables emendaciones, adiciones y mejoras* (1918); *Documentos lingüísticos de España, I: Reino de Castilla* (1919); *El Cid en la historia* (1921); *Poesía popular y poesía tradicional en la literatura española* (1922); *Poesía juglaresca y juglares: aspectos de la historia literaria cultural de España* (1924); *Manuel elemental de gramática histórica española, 5a. ed., corregida y aumentada* (1925); *Orígenes del español: estado lingüístico de la Península Ibérica hasta el siglo XI* (1926); *Rodrigo el último godo* (3 vols., 1925-1927); *El Romancero: teorías e investigaciones* (1927); and *Flor nueva de romances viejos que recogió de la tradición antigua y moderna* (1928).

MENGELBERG, mēng'el-bērg, WILHEM (1871-). A Dutch orchestra conductor

(see Vol. XV). In 1921 he made his second visit to the United States and conducted the newly established National Symphony Orchestra of New York for the second half of the season (Jan.-Mar.). His sensational success brought about the amalgamation of the new orchestra with the Philharmonic Society and his permanent engagement as conductor for the second half of the Philharmonic season (Jan.-Apr.). He retained at the same time his post as regular conductor of the Concertgebouw Orchestra in Amsterdam for the summer and fall; during his absence in New York, this orchestra played under guest-conductors. After the amalgamation of the Philharmonic Society with the New York Symphony Orchestra (1928), he shared the conductorship of the new Philharmonic-Symphony Society with Toscanini. In 1929 he resigned his post with the Concertgebouw Orchestra.

MENOHER, CHARLES THOMAS (1862-). An American army officer, born in Johnstown, Pa., and educated there and at the United States Military Academy. He went to France in 1917 in command of the 5th Field Artillery (Regular). He later commanded the school of instruction for field artillery at Saumur in France. He was in command of the 42d (Rainbow) Division and later the 6th Army Corps, participating in the battles of Château Thierry, St. Mihiel, and the Argonne. He was promoted to major general, U. S. Army, in 1921. He was director of the Air Service 1919-21; commanded the Hawaiian Division, 1922-24, the Hawaiian Department, 1924-25, and the 9th Corps Area, 1925. He was retired in 1926. He received the Distinguished Service Medal and was decorated by the governments of France, Belgium, and Italy.

MENSHEVIKS. See RUSSIA, under *History*.

MENTAL MEASUREMENT. The rise of intelligence tests since 1914 constitutes one of the most remarkable chapters in the history of applied science. Significant alike for its bearing on psychological theory and its effect on educational and personnel practice, the development of mental measurements has been attended by bitter controversy and enthusiastic hopes. The very nature of the undertaking, the effort to chart the resources and capacities of the human mind, could scarcely permit the scientific or the lay public to remain either indifferent or uninterested. The peculiar organization of the American school system, its freedom from tradition and from the control of a central authority, and its readiness for pedagogical experimentation, all combined to give impetus to the movement for mental testing. Then, too, the increasing necessity for efficiency and the growing importance of man-power during the World War prepared the way for the acceptance of any devices which would put men where they could do their best work and which would enable them to do that work most efficiently.

If we add to this the preoccupation of the American public with the question of the quality of the immigration during recent years, and the opportunity afforded by the army mobilization for classifying the intellectual fitness of the racial stocks in the United States, we can see the reason for the extraordinary interest in the technique of mental measurement.

The pioneer construction of tests was the work of Cattell, 1890, and Münsterberg, 1891, in America, Binet and Simon in France, 1896, and

Claparede, 1895, in Switzerland. Cattell had interested himself in the measurement of the differences among people, and in 1894 devised tests for the measurement of the mental traits of college students. Münsterberg devised tests for special aptitudes, particularly those having to do with practical life situations. Binet and Simon developed mental tests for children in the public schools and Claparede applied his measurements to pathological cases. Each of these fields has expanded and developed to a surprising degree.

The tests which have grown out of the work of Binet and Simon have become widely known through the Stanford Revision prepared by L. M. Terman (*Measurement of Intelligence*, 1916). These tests were arranged in the nature of a scale in units of one or more years of age, covering the period from the age of three years to the point where intellectual growth should cease. At each year, there were tests of the things that the average child of that year could be expected to do. A child was said to have the intelligence of that age whose tests he could succeed in passing. This "mental age" could then be compared with his chronological age and his intellectual status in relation to others of his age determined. A further step was taken by expressing the difference between the age in years and the standing on the test in years in terms of a ratio, called the intelligence quotient, or I. Q. Thus, a child of eight years who passed the eight-year test would have an I. Q. of 1.00; a child of eight years who passed the 10-year test would have an I. Q. of 1.25; and a child of eight years who could pass only the six-year test would have an I. Q. of .75. The intelligence of a child of three years, for instance, is estimated in terms of his ability to point to eyes, nose, mouth; his ability to repeat digits, etc.; while the tests of the later years deal more and more with abstract symbols. The retests of children at Stanford University and elsewhere seem to confirm the view that the I. Q. is relatively constant, successive determinations varying not more than 10 per cent.

Another test for the measurement of intelligence is the Yerkes-Bridges point scale (Yerkes, Bridges, Hardwick, *A Point Scale for Measuring Mental Ability*, 1915) in which, as the name implies, the score is in terms of points instead of years of age. The score made by any individual may then be compared with the average score made by children of the same age. The resulting ratio is known as the coefficient of mental ability.

As the use of these tests increased, the need arose for tests extending below the age of three years and above the age of sixteen years. As an illustration of the former, see Kuhlmann test (F. Kuhlmann, *A Handbook of Mental Tests*, 1922), which is usable for children as young as 3 months; and for the latter, see A. Otis, *Self Administering Tests of Intelligence*, which may be used for adults of any age.

On account of the fact that such tests as those mentioned above use words and abstract ideas, serious difficulties arose in testing foreign, illiterate, blind, and deaf children. To offset this difficulty, the so-called performance tests and non-language tests have been devised, such as the Pintner-Patterson performance test (R. Pintner and D. Patterson, *A Scale of Performance Tests*, 1917), and the Pintner non-language test (*Journal of Applied Psychology*, 1919).

The tasks in these tests are in the nature of puzzle blocks, form boards, etc. Scoring is by the point-scale method. Many attempts have been made to provide norms by which scores on a performance test may be translated into scores on an abstract symbol test, but none has been entirely successful.

When the United States entered the World War, the psychologists were called upon to prepare an intelligence-measuring test for the classification of recruits. Instruments for measuring one individual at a time were not feasible for handling such a great task; consequently, the so-called group tests (Army Alpha, and Army Beta, see *United States Army Tests*) were devised, with which as many as 500 men could be examined at one time (see Yerkes and Yoakum, *Army Mental Tests*, 1920). These tests differed from the individual tests mainly in the fact that there was a time limit for each portion of the test and the measure of the intelligence was the amount that could be done correctly within the time limit. Stencils were used in scoring the finished tests, so that the work could be done by ordinary clerks after a few simple instructions.

The success of the group tests in the rapid classification of soldiers according to intelligence led to the development of a great number of similar tests for many purposes, such as the classification of school children, college students, office workers, etc. Among the best known of these are the E. L. Thorndike "Intelligence Examination for High-school Graduates," A. S. Otis, "Group Intelligence Scale," L. M. Terman, "Group Test of Mental Ability." There are tests of this character suitable for any age group. See T. L. Kelley, *Interpretation of Educational Measurements*, 1927.

The rapid development and extended use of these tests have been accompanied by a controversy as to the proper definition of intelligence, as to just what the tests really measure, as to the age at which intellectual maturity is reached, as to whether learning or native endowment is the more potent factor in determining test score, as to the influence of literacy and illiteracy, of foreign birth, foreign parentage, social status, etc., upon the test score. Many of these questions, theoretical and practical, are still unanswered. For articles concerning these matters, see, particularly, *Journal of Educational Psychology*, also, *Twenty-Seventh Year-Book of the National Society for the Study of Education* (1928).

In addition to general intelligence, whose measurement has just been discussed, every individual is believed to possess special capacities, whether few or many is not definitely known. Among these are mathematical, musical, and artistic capacity (see C. E. Seashore, *The Psychology of Musical Talent*, 1919). There are also many other more highly specialized aptitudes required for the successful handling of special tasks, such as one meets in business and industry. For a good account of such aptitudes and the technique of measuring them, see C. L. Hull, *Aptitude Testing*, 1928.

The last 10 years have produced many tests of another side of mental life, namely, character, temperament, or personality. As in the case of the intellectual traits, there are assumed to be general and special character or personality traits, each requiring a test or a battery of tests to measure them. The most ambitious of

the general character tests is the Downey Will-Temperament Test (1921), which aims to measure the amount of energy available for action and the ease or difficulty with which it can be transformed into action. The most highly developed test of a special personality trait is the measure of trustworthiness or deceit (M. A. May and H. Hartshorne, *The Measurement of Deceit*, 1928).

Finally, there are many important mental traits for which no adequate tests have been constructed. Some evaluation of them, however, is essential for practical purposes, and special methods for *judging* the extent of their presence and for increasing the validity of the judgments have been devised. The most common of these instruments is known as the rating scale (see A. T. Poffenberger, *Applied Psychology*, chap. 15, for a brief discussion of judgment and rating scales).

In the construction, standardization, and validation of mentality measuring devices, elaborate mathematical and statistical procedures have been devised, among them the measures of relationship built upon the conception of Francis Galton by Karl Pearson and others. The techniques of correlation, partial correlation, multiple correlation, regression equations, etc., have become the common tools of the testing laboratory. See C. L. Hull, *Aptitude Testing*, 1928; H. E. Garrett, *Statistics for Students of Psychology and Education*, 1926; and, for more advanced treatment, T. L. Kelley, *Statistical Method*, 1923.

United States Army Tests, 1917-1919. For the rapid classification of the immense numbers of army recruits, a new form of intelligence test was required, one that could be used for testing large groups of men simultaneously in a short time, and with a very simple method of scoring. A committee of psychologists was drafted to prepare such a measuring instrument. After a series of preliminary trials in several army camps, tests known as Army Alpha and Army Beta were evolved, the former resembling the individual intelligence examination of the abstract sort, and the latter resembling the performance or non-language sort, being administered by means of a kind of pantomime demonstration. In addition to these two instruments for group testing, the Stanford Revision of the Binet Test and the Pintner-Patterson Performance Test were used for doubtful cases. The test procedure was somewhat as follows. A group of 200 to 500 men would be called for examination. Those who could read and write English were given the Alpha test, those who were illiterate or foreigners, or who failed to pass the Alpha test, were given the Beta test. Those who failed to pass the Beta were given one or the other of the individual examinations.

Altogether, there were examined in this fashion 1,726,966 men, including 42,000 officers, individual examinations being given to 82,500 men. The printed report of this psychological work appears in *Memoirs of the National Academy of Sciences*, vol. xv, covering 900 pages of text and tabular matter. This material has been worked over by a number of investigators interested in such matters as the intellectual status of the different racial groups making up the population of the United States, the relative intelligence of the Negro and white populations of the draft, the relative intellectual status of the draft from different sections of the coun-

try and from the different States. Inferences have been drawn from these studies, many of them unjustified, which have added fuel to the controversies already being waged concerning the nature of intelligence, racial differences, etc. Particularly active has been the dispute concerning the relative intellectual standing of different racial stocks, such as the Nordic, as inferred from their samplings appearing in the United States Army. See C. C. Brigham, *American Intelligence* (1923).

The results of the tests have been offered as evidence of heavy environmental influence upon intelligence scores, or of heavy hereditary influence upon the same. Involved in this controversy are such factors as the influence of knowledge of the English language, of certain habits of thought, of social status, and of less tangible environmental forces. There is no doubt at all that the native white draft made a better record than the recent immigrants from southern and eastern Europe, and the Northern and Southern American Negro. Just what these differences really mean must be left for future researches to determine.

Bibliography. Books on intelligence testing, are legion. Pintner's *Intelligence Testing, Methods and Results* (1923) may be recommended to the elementary student. Terman's *Measurement of Intelligence* (1916) and *The Intelligence of School Children* (1919) give the point of view of the leader of the Stanford school. *Memoirs of the National Academy of Sciences*, vol. xv, entitled "Psychological Examining in the United States Army" (1921), is an indispensable work of reference. A good controversial discussion of the subject, induced by Walter Lippman's attack on the army tests, may be found in the 1922 and 1923 volumes of the *New Republic*, and more scientific discussions in the psychological periodicals, particularly the *Journal of Educational Psychology*, beginning with vol. xiii. An excellent collection of studies concerning factors which influence intelligence-test and achievement-test scores will be found in the 27th *Yearbook of the National Society for the Study of Education*, 1928. For a discussion of tests particularly adapted for business and industry, consult H. E. Burt, *Principles of Employment Psychology* (1926); and for tests to be used in the clinical and psychopathological laboratory, see F. L. Wells, *Mental Tests in Clinical Practice* (1927) and S. I. Franz, *Handbook of Mental Examination Methods* (1919). See EDUCATION, under *Intelligence Testing*.

MENUHIN, YEHUDI (1917-). A Russian-American violinist, born in Palestine. Soon after his birth, his parents settled in San Francisco, where the boy received his instruction on the violin from Louis Persinger. So rapid was his progress that on Mar. 30, 1925, he gave his first public recital in San Francisco, and on Jan. 17, 1926, was heard with orchestra in New York, attracting but passing attention on either occasion. His parents then took him to Paris, where he continued his studies under Georges Enesco, and in the fall of 1927 gave a recital at the Salle Gaveau which created a sensation. A few days later, he played the Tchaikovsky concerto as soloist with the Lamoureux Orchestra and the critics unanimously acclaimed him a master of the first rank. A few weeks later, the New York critics concurred in this verdict, when the boy played the colossal Beethoven concerto with the New York Sym-

phony Orchestra under Fritz Busch (Nov. 25, 1927). The parents wisely refused innumerable offers from managers and returned to San Francisco, where the young artist continued serious study with his first teacher, Mr. Persinger. Early in 1929, he played again in three concerts in New York, receiving veritable ovations, and proceeded to fill a limited number of engagements in Germany, repeating his French and American triumphs. On the occasion of his twelfth birthday (Feb. 1, 1929), some American admirers presented him with a magnificent Stradivarius of 1733, valued at \$60,000.

MENZEL, ADOLF (1857-). An Austrian jurist, born in Reichenberg. Concentrating upon civil and public law, he became professor of these subjects at the University of Vienna and vice president of the Austrian Administrative Court. His numerous works include *Protagoras* (1910); *Kallikles* (1923); and *Umwelt und Persönlichkeit in der Staatslehre* (1926).

MENZIES, ALAN WILFRID CRANBROOK (1877-). An American chemist, born at Edinburgh, Scotland. He was graduated from Edinburgh University and later studied at Aberdeen, Leipzig, and the University of Chicago. He was assistant professor of chemistry at Henriot-Watt College in Edinburgh and professor of chemistry at Mungo's College at Glasgow. In 1908 he came to the United States and became connected with the chemistry department of the University of Chicago (1908-12), and during 1912-14 he was professor and head of the department of chemistry at Oberlin. He resigned from Oberlin in 1914 to accept a call to the chair of chemistry at Princeton. He was also associate chemist with the Bureau of Standards in Washington (1918-19). His original researches were chiefly concerned with matters of physical chemistry, such as vapor pressure and vapor density, molecular weights, ebullioscopy, and hygrometry.

MERCHANT MARINE. See SHIPPING; SHIPBUILDING, etc.

MERCIER, mâr'syâ, DESIRÉ JOSEPH, CARDINAL (1851-1926). Belgian primate of the Roman Catholic Church (see Vol. XV). During the World War, he was uncompromising in his opposition to the hardships imposed on the Belgian people by their German rulers and unceasing in his demands for the betterment of conditions. His Christmas pastoral letter, an eloquent exposition of the civic and national rights of Belgium, resulted in his arrest in January, 1915. Soon released, although commanded not to leave his residence, he remained throughout the German occupation a thorn in the side of the German officials and administration. After the War, he worked unceasingly for the unification of the various denominations of the Christian churches. In 1919 he published *War Memories*. He also wrote several books on philosophy, including *A Manual of Modern Scholastic Philosophy* (1917). In 1919 he visited the United States. Consult the following biographies: *Le grand Cardinal belge, Désiré Joseph Mercier, 1851-1926*, by G. Rœnackers (1926); *The Life of Cardinal Mercier*, by Henry Dubly (1928), and *Cardinal Mercier* by Monsignor A. Laveille (trans. 1928).

MERCURY. See QUICKSILVER.

MERCURY BOILER. See BOILERS under *Mercury Boiler*.

MEREDITH, EDWIN THOMAS (1870-1928). An American agriculturalist and public official,

born at Avoca, Iowa, and educated at the Highland Park College in Des Moines, Iowa. For several years, he edited the *Farmers' Tribune*, at Des Moines, and in 1902 he established *Successful Farming*. He served as a member of the Board of Excess Profit Advisers, by appointment of Secretary of the Treasury McAdoo in 1914, and as a member of the Industrial Conference, by appointment of President Wilson in 1919. He was also a member of several other boards engaged in agricultural investigations. In 1920-21 he was Secretary of Agriculture in the cabinet of President Wilson. He was considered in 1924 and 1928 as a possible Democratic candidate for the Presidency.

MERRIAM, JOHN CAMPBELL (1869-). An American paleontologist (see Vol. XV). In 1919 he was chairman of the National Research Council, and in 1920 he became president of the Carnegie Institution of Washington, D. C. He was a member of many scientific organizations and wrote *The Research Spirit in the Everyday Life of the Average Man* (1920); *Common Aims of Culture and Research in the University* (1922); *The Place of Education in a Research Institution* (1925); *International Cooperation in Historical Research* (1926); and other papers.

MERRICK, LEONARD (1864-). A British novelist and short-story writer, born Miller, who was educated at Brighton College and private schools. He was an actor for two years before turning to writing. In 1918 a collected edition of his work, with introductions by many of the most famous authors of the day, was published. His writings include *Mr. Bazalgette's Agent* (1888); *Cynthia, a Daughter of the Philistines* (2 vols 1896); *The Actor-Manager* (1898); *The Worldlings* (1900); *Conrad in Quest of his Youth* (1903); *The House of Lynch* (1907); *The Man Who Understood Women* (1908); *All the World Wondered* (1911); *While Paris Laughed* (1918); *A Chair on the Boulevard* (1921), and *To Tell You the Truth* (1922). He also wrote a number of plays.

MERRILL, ELMER DREW (1876-). An American botanist, born at East Auburn, Me., and educated at the University of Maine and George Washington University. After serving on the faculty of the University of Maine and with the Department of Agriculture in Washington, he was appointed botanist by the Bureau of Agriculture at Manila, P. I., in 1902. In 1912 he was appointed associate professor of botany and head of the department at the University of the Philippines, where he became full professor in 1916. In 1919 he became director of the Bureau of Science in Manila; in 1923, dean of the College of Agriculture and director of the agricultural experiment station at the University of California. Professor Merrill carried on many investigations in the Philippines and elsewhere and described more than 2500 new specimens of plants. He was a member of many scientific societies and the author of *A Flora of Manila* (1912); *Enumeration of Bornean Plants* (1921); *Enumeration of Philippine Plants* (1922-23); and many articles on the botany of North America, China, the Philippines and Malaya.

MERRILL, GEORGE PERKINS (1854-1929). An American geologist (see Vol. XV). He continued as head curator of the department of geology in the U. S. National Museum until his

death. He was the author of *Handbook of Gems and Precious Stones* (with others, 1922), and *The First Hundred Years of American Geology* (1924), and was a contributor to various encyclopedias.

MERRILL, PAUL WILLARD (1887-). An American astronomer. He was born at Minneapolis, Minn., and graduated at Stanford University (1908). For five years, he was fellow and assistant at Lick Observatory, Calif., while securing his Ph.D. degree at the University of California (1913). He was instructor in astronomy at the University of Michigan (1913-16), and assistant and associate physicist of the U. S. Bureau of Standards at Washington, D. C. (1916-18). Since 1919 he has been astronomer at the Mt. Wilson Observatory of the Carnegie Institution. In 1929 he was elected to the National Academy of Sciences.

MESOPOTAMIA. See IRAQ.

MESSNER, JOSEF (1893-). A Swiss composer and organist, born in Schwaz, Tyrol. He received his musical education at the Akademie der Tonkunst in Munich, and became organist at the Metropolitankirche there in 1922. In 1926 he settled in Salzburg as organist at the Cathedral. He was the composer of a biblical opera, *Hadassa* (Aix-la-Chapelle, 1925), two symphonies, C minor and F minor; *Sinfonietta*, in D minor; *Das Leben*, for chorus and orchestra; *Marienlegenden* for voice, strings, harp and horn; Mass in D; *Missa poetica*; and many sacred compositions in smaller forms.

MESTROVIĆ, IVAN (1883-). A Yugoslav sculptor, who was trained at the Academy of Art in Vienna. He exhibited at London (1906, 1915, 1917), Paris (1907-08), Rome (1911), Venice (1914), and in other cities before becoming rector of the Art Academy at Zagreb. His principal works are a memorial chapel to the Racic family at Cavtat, Ragusa; a seated memorial figure of Bishop Strossmayer, Croat patriot; a portrait of President Masaryk of Czechoslovakia; wood carvings on biblical subjects, and several portraits made in England and America. His "The Archangel Gabriel" is owned by the Brooklyn Museum (New York). See SCULPTURE

METALLURGY. See CHEMISTRY, APPLIED; COTTRELL PROCESS; ELECTRIC FURNACES.

METCHNIKOFF, méch'nik-ôf, ELIE (1845-1916). A biologist of Russian birth and French citizenship (see Vol. XV). He drank his artificially soured milk faithfully each day for 19 years and considered that his doctrines of survival had been upheld in his own case as none of his near relatives lived over 55 years. He died when 71 years old. His widow, Olga Metchnikoff, wrote his biography.

METEOROLOGY. The period after 1914 witnessed a great expansion of the meteorologist's activities through increased emphasis on meteorology in military operations, civil and commercial aviation, agriculture, weather insurance, and numerous industrial fields. A prodigious advance was made in the organized collection and dissemination of weather information over land and sea by telegraph, cable, and radio. Daily synoptic charts now cover the larger part of the northern hemisphere, including the ocean areas and the far north; and the systematic exploration of the upper air by kites and pilot balloons has increased markedly.

To provide a solid basis for the improvement of day-to-day weather predictions, for the extension of forecasts over longer periods of time,

and for the development of the mathematical theory of atmospheric phenomena, we need an adequate body of both surface and free-air observational data from land and sea, together with a skillful coordination of these facts of observation by the mathematician and physicist. While the time seems remote indeed when forecasting can wholly cease to be an empirical art, nevertheless every advance, however small, in our theoretical understanding of the physical processes going on in the atmosphere provides increased insight which cannot fail sooner or later to react on meteorological practice and to lead to improvement in forecasting.

Moreover, there is no indication whatever that to reduce atmospheric phenomena to order it is necessary to discover new physical laws at present unthought of, or, despite the unfounded claims of some investigators, to seek the solution in some vague, hitherto unrecognized cosmic or electromagnetic influence.

Statistical Meteorology. To understand fully the weather of any given locality, and to anticipate its changes to any great extent in advance, it is necessary to take a world-wide view. Cold waves, periods of drought, abnormal seasons, etc., are intimately connected with the prevailing distribution of barometric pressure, and the resulting general circulation, over an entire hemisphere. Profound modifications of the pressure distribution are often first indicated in polar regions. Loss of heat from these regions results in the accumulation of great volumes of cold air which sooner or later must break out over lower latitudes and cause great periodical readjustments of pressure distribution over the hemisphere; and these in turn determine the winds, storm paths, and weather conditions in general.

So many factors are operating simultaneously and in such a complex manner to determine exactly what sequence of phenomena shall take place that it is hopeless to attempt to work out the relations involved *a priori* from theoretical considerations. Our immediate efforts must be directed toward ascertaining these relations empirically; the methods of mathematical statistics have come into extensive use for this purpose. The method of correlation has been used in the hope of empirically discovering relations which would be of value in long-range forecasting, but in general the correlation coefficients obtained are too small to render this method highly successful; prediction requires highly correlated variables. The present position of long-range forecasting in general is not at all hopeful; widespread public interest and expectations have been aroused from time to time by the announcement of the alleged discovery of new methods of forecasting, some based on apparent cycles or periods in weather conditions, others on the influence of sunspots or of the greater or less fluctuations in the intensity of solar radiation, but it is agreed by competent meteorologists that the results so far obtained in such studies cannot be used to forecast, with any confidence, even the general nature of future weather and that no sound and reliable basis for scientific long-range forecasts has yet been established. It is true, however, as Hildebrandson, Exner, Walker, and others have shown, that the general character of the weather conditions at any given place is to a surprising extent related to the antecedent conditions over a large part of the rest of the globe, and the statistical

coordination and correlation of the succession of seasons in all parts of the world holds some promise of partially solving the problem of long-range forecasting for tropical countries; fair success has attended G. W. Walker's forecasts of the monsoon rainfall of India by the use of the correlation coefficients between the amount of this rainfall and sundry meteorological conditions over various parts of the globe in the spring of the same year or earlier.

If correlation is resorted to only for the purpose of discovering relations between different phenomena, a small coefficient, if sufficiently larger than its probable error, is just as likely to give valuable information as a large one, although the interpretation of the coefficients frequently is difficult and uncertain, and the physical reasons for their existence impossible to assign.

Dynamical Meteorology. It is well known that all but a negligible fraction of the energy involved in meteorological phenomena is derived ultimately from the solar radiation that is intercepted by the earth. The atmosphere acts like a gigantic heat engine, transforming radiant energy into the energy of weather processes; and the phenomena take place in accordance with established laws of dynamics and thermodynamics. The comparatively simple conceptions formerly entertained as to the mechanism by which the transformations of energy are accomplished and the observed phenomena produced have, however, been found to need radical revision, and much remains that is as yet very imperfectly understood.

The primary cause of all meteorological phenomena is the heating in the tropical regions and the cooling in the polar regions; the temperature contrast thus set up induces the general atmospheric and oceanic circulations. In the long run, the total amount of heat lost by the earth as a whole, through outgoing terrestrial radiation, must be just equal to the total heat gained through incoming effective solar radiation (since no part of the earth is growing steadily warmer or colder), but at any one place this is not in general true; the equatorial regions receive more radiation than they emit, the excess energy being transported by the circulations of the ocean and the atmosphere to higher latitudes, where more radiation is given out than is received. The transport of heat by the circulations tends to eliminate the temperature difference between lower and higher latitudes, and a steady state is reached when a balance is struck between the two opposing tendencies. Extratropical cyclones and anticyclones are secondary circulations incident to the general planetary circulation, and may be shown to be necessary consequences of the physical conditions under which the latter takes place, but the details of their origin and mechanism are still imperfectly known.

Atmospheric Circulations. At first sight it might seem natural that the motion of air should be directly from regions where barometric pressure is high to regions where it is low, but the most casual examination of a weather map shows that this is not the case; it is indeed the primary tendency, but this tendency is almost completely checked by the effect of the earth's rotation, and we get instead a circulation practically *parallel to the isobars*. The only forces acting on a particular volume of air are gravity, hydrostatic pressure arising from the ac-

tion of gravity on the rest of the earth's atmosphere, and friction, including internal friction due to viscosity and turbulence. The acceleration of the air under these forces is composed of two parts, acceleration relative to the surface of the earth, which is observable, and acceleration common to this surface itself, the latter giving rise to the so-called deflecting force of the earth's rotation. After a steady state has been attained, which takes but a brief time, *in the absence of friction* the direction of the wind is *along the isobars*, and the velocity is so adjusted that the force arising from the pressure gradient, tending to push the air in toward the region of low pressure, is just balanced by the tendency of the moving air to turn to the right, in the Northern Hemisphere, because of the earth's rotation, together with the outward tendency due to the centrifugal force arising from the curvature of the path. This resulting wind is known as the *gradient wind*. In the strata near the ground, the retardation due to friction causes the air to lose some of the velocity necessary to maintain the balance, and the wind direction is more or less inclined away from the isobars toward the lower pressure.

If, as in lower latitudes, the influence of the earth's rotation is relatively small and friction is negligible, the pressure differences between points at the same level in the atmosphere are mainly occupied in producing acceleration relative to the ground in accordance with the ordinary laws of hydrodynamics; that component of the gradient wind determined by the centrifugal force, known as the *cyclostrophic component*, is alone important as soon as the wind reaches a very moderate velocity. Such winds, which have been called *Eulerian* by Jeffreys, are exemplified in the tropical cyclone. If, as is generally the case in the comparatively slow-moving extratropical cyclone, the *cyclostrophic component* is negligible, the pressure differences are mainly occupied, in the absence of friction, in guiding the air under the influence of the earth's rotation; the resulting winds are known as *geostrophic*. If, as in land and sea breezes, friction is the main thing which the pressure differences have to overcome, the winds blow in the direction of the gradient, but without acceleration, and have been styled by Jeffreys *antitriptic winds*.

In the absence of direct observation, the gradient wind indicated by the surface pressure chart is the best estimate which can be given of the actual wind at an elevation of 1500 feet. For much greater heights, the surface map may fail to give a correct idea of the pressure distribution there. The law of approach from the surface wind to the undisturbed gradient flow above is very complex; a number of empirical formulas have been devised to express the variation of velocity with height in the lower levels, but the greatest insight into the motion of the air in the lowest strata has been given by the mathematical theory worked out since 1914 by G. I. Taylor, L. F. Richardson, F. J. W. Whipple, and others:

Friction and surface irregularities put the lower air into a very turbulent state; whirls and eddies of varying sizes are constantly being formed, and reveal their presence in the gustiness of the wind and in the dispersion of the smoke from a chimney. While the spin of an eddy is maintained, the mass of air composing

it is endowed with a special forced motion, but presently the eddy disintegrates, and the air which has been forcibly transported in the eddy mixes with its new surroundings. The result, even in the lightest wind, is the mixing of adjacent layers of air; the air transported by the eddies carries with it its momentum, heat, and water vapor, and thus the eddy motion causes a gradual diffusion of these in accordance with laws identical in form with those governing the diffusion caused by molecular motions. The lower layers gain in momentum and generally in heat, at the expense of the upper; the effect is to endow the lower atmosphere with a virtual or pseudo viscosity many thousand times greater than the ordinary molecular viscosity, and with a correspondingly great eddy conductivity for heat and for water vapor. The values of these coefficients of eddy conductivity and eddy viscosity depend on the configuration and nature of the ground surface, the temperature of this surface, the time of day, season, cloudiness, etc. Above the first one or two kilometers, the influence of surface turbulence may generally be regarded as eliminated. Eddy motion or atmospheric turbulence has been found to play an important part in the diurnal and seasonal variations of wind velocity, in the formation of clouds and fog, and in numerous other phenomena; and in recent years, the study of turbulence and its effects has become a distinct branch of meteorology, with a large and growing literature.

Vertical motions in the atmosphere, because of their effects on the water vapor present, are of extreme importance, however, under ordinary circumstances, the magnitude of the vertical component is exceedingly small: The temperature of the air falls at an *average* rate, nearly the same in all parts of the world, of about 6°C. per kilometer increase of height up to an altitude which, according to latitude, season, and surface barometric pressure, varies from about 9 to 16 kilometers, beyond which the temperature ceases to fall in a vertical direction. This upper layer of zero lapse rate is called the stratosphere or isothermal layer; the lower region is known as the troposphere. The lapse rates, or vertical temperature gradients, over the globe are such that, under normal conditions, if a mass of dry air be displaced upward or downward it tends to return to its former level, since the adiabatic heating or cooling due to the vertical motion causes the temperature of the mass to change with height more rapidly than that of the surrounding atmosphere; the lapse rates thus introduce a physical constraint that tends to prevent air from moving in any but an almost horizontal direction. Mere surface heating, even when aided by the latent heat set free by the condensation of water vapor, usually is unable to cause air to ascend through the environment to very great heights; particularly in the polar regions, the atmosphere is in a very stable condition. However, if the air is exceptionally hot and humid (as it is in the tropics), or if the lapse rate happens to be greater than usual, or both (as in the case of thunderstorms), surface heating aided by condensation may send air upward to great heights. Since there is no process corresponding to condensation that will extract heat during descent (except possibly radiation), air seldom is able to descend locally through its environment to any great extent, but comes down by

gradual settling over a large area. In addition to local penetrative *thermal* convection, however, requiring high temperatures and humidities, there also occurs *mechanical* or forced convection, such as is responsible for the large scale upward movements in the rain area of a cyclone.

Cyclones. The instantaneous picture provided by the synoptic chart gives no indication of the true trajectories of moving air; when these trajectories are worked out by special investigations, it is found that the cyclone is not composed of the same air circulating round and round the centre as the storm travels. Also, the maps show no signs of the distribution of temperature, wind, etc. which the existence of a vortex would imply; hence, for some time the old vortex theory of extratropical cyclones has been in disfavor. Nevertheless, a vortex theory can be made to account for many facts of observation, and it may be shown that under the actual circumstances of the case it would be difficult or impossible to recognize the presence of a vortex, particularly from the surface map, even if one existed.

We know that the air is full of imperfect whirls or eddies of all sizes; and Fujiwhara has recently shown that under suitable circumstances large vortices are built up through the absorption of the energy of the numerous small whirls into whirls of the next larger size, and so on, and similarly a large vortex dissipates by successively developing series of vortices of the next lower order. Rayleigh in 1917 showed that, provided there were already some vorticity in the atmosphere, all that was necessary to effect the development of a single large vortex was the removal of air from the region that would form the core. Thus the initial step of adding energy to the existing small imperfect vortices which we know to be in the air could be effected by removing a part of what would be the central portion of the resulting cyclonic vortex.

The old thermal convection theory of cyclones, however, which postulated the ascent of a large body of air as a coherent mass, is untenable in the light of present knowledge. Sir Napier Shaw has suggested instead, as the process of the required removal of air, its *eviction* by a scouring action in the layers through which penetrative convection passes. The rising air drags up with itself a surprisingly large portion of these layers through eddy mixing; this might account for the development of a cyclonic vortex attended by a reduction of pressure and a consequent lowering of the temperature. Shaw's theory seems quite applicable to tropical cyclones, and appears capable of accounting for some at least of the extratropical ones.

On the other hand, the meteorologists of the Meteorological Institute at Bergen, Norway, have brought to light details of cyclonic phenomena, not known before, which have led them to quite another conception of the nature of an extratropical cyclone. Deprived of weather telegrams from the greater part of Europe during the War, the Norwegian meteorologists found their isobaric charts, which covered only a very limited area, of comparatively little use for forecasting, and they were led to a serious attempt to use in practice a method of forecasting which V. Bjerknes had originally evolved from theoretical considerations. Detailed reports from a very close network of stations revealed the existence in the normal cyclone of two lines of discontinu-

THE STRUCTURE OF THE NORMAL CYCLONE ACCORDING TO V. BJERKNES

ity, meeting at the centre and dividing the cyclonic area into quite unequal portions. These two lines mark the boundary of a projection of warm air, generally from the southward, into a region of cold air. The line running from the centre toward the eastern or advancing side is called the steering line, or more recently the warm front, under normal conditions it is marked by a rise of temperature, preceded by a considerable and prolonged fall of rain. The other line, running from the centre in a south-westerly direction, is called the squall line, or cold front, it is marked by a sudden fall of temperature accompanied by a brief shower of rain.

The cyclone is thus divided into a warm sector and the cold remainder. The lines of discontinuity have been explained as delineating the ground plan of a complicated surface of discontinuity which extends up into the free air and separates cold air of northern origin from warm air of southern origin. The rain in advance of the warm front is attributed to the general ascent of the warm air from the south up over the bank of cold air to the north, along a gentle slope; and the rain of the cold front

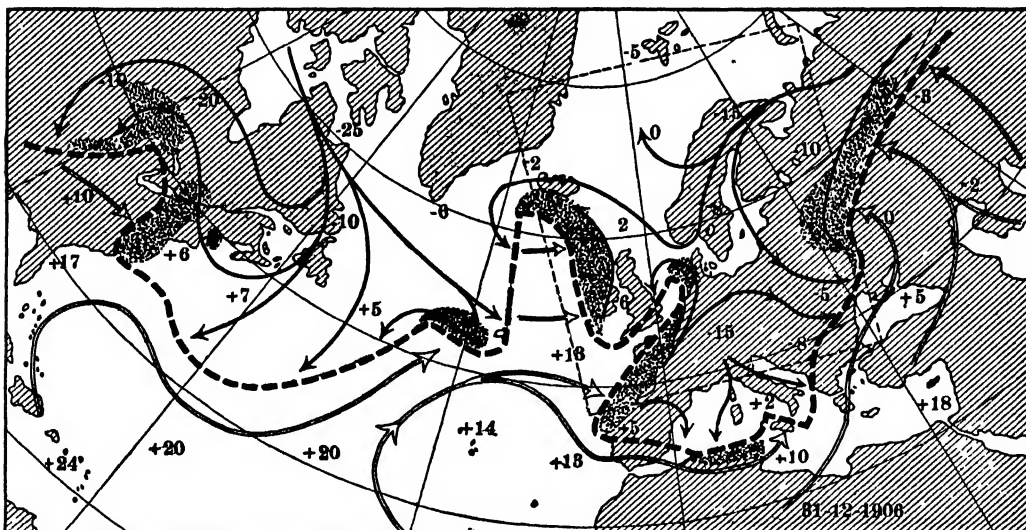

is attributed to the undercutting of the warm air by the cold air in its rear with a somewhat steeper surface of separation. Rainfall in regions outside the two which are associated with the two fronts, apart from wet fog or drizzle, is attributed to the local instability of air passing over warmer sea or land; it is particularly prominent over the land in summer and over the sea in winter.

Detailed maps show that the line of discontinuity formed by the warm and cold fronts together extends continuously from cyclone to cyclone. After extensive experience with detailed maps, it becomes possible to recognize the line on less detailed ones; it is then found that the line completely surrounds the entire polar regions, and the name Polar Front has been given to it; the air on the northern side is of polar origin, that on the southern side of tropical origin. Heavy cold air flows out along the ground from polar regions, separated from the overlying warm air by a surface of discontinuity. The Polar Front has a wavy form, cold and warm tongues of air alternately extending toward equator and pole, and is in continuous undulating motion, sweeping the whole

temperate zone from west to east, and producing the weather changes of temperate latitudes. At the northern ends of the warm tongues are the centres of the cyclones; the broad tongues formed by the expulsion of great masses of accumulated polar air are the anticyclones between. If a tongue of warm air extends too far, and a portion of equatorial air gets completely surrounded at the ground by colder air, the cyclone fills up and expires, and a secondary may develop at the point of overlapping of the two cold fronts. The poles are not of course

shows that young depressions correspond to slight waves with small excursions from the equilibrium state; later, the amplitudes increase simultaneously with a deepening of the depression. The ascending currents starting from the warm wave gradually diminish the area of the warm sector of the cyclone. The tongues of polar air on both sides of it accordingly approach each other and finally close together, so that air of cold origin surrounds the cyclonic centre on all sides. The potential energy of the system of adjacent cold and warm air masses

FRONT OF POLAR AIR, DEC. 31, 1906.

The rainstorm which is occurring near the Great Lakes arrived at the coast of Norway on Jan 5, 1907.

the only possible sources of a discontinuity; the northern slopes of the Asiatic continent are an effective substitute, both winter and summer.

The above empirical representations of the facts of the synoptic charts have already proved of quite material assistance to forecasting in Norway. Bjerknes has, in addition, sought to give them a dynamic interpretation. He holds that the synoptic maps can be simulated by wave motion on either side of the surface of discontinuity. The discontinuity is considered a natural consequence of the dynamic conditions of an atmosphere on a rotating globe. The cyclonic depressions of middle latitudes begin as convolutions of the surface of discontinuity due to the instability of adjacent warm and cold air in relative motion. At sea level, they appear as collections of approximately circular isobars because the surface of discontinuity is not vertical but tends toward parallelism with the axis of the earth or even less inclined to the surface than this. The successive cyclones of the temperate zones are thus regarded as waves on the boundary surface between the cap of polar air and the surrounding warm air masses. The corresponding boundary line at the ground, the Polar Front, traverses the centres of depressions all the way around the earth. The extreme northern ends of the warm waves coincide with the centres of low pressure, and the cold waves of polar air between them constitute the moving wedges of high pressure. The examination of depressions individually, from their formation to their disappearance,

is then lost, and the cyclone begins to fill up. The missing asymmetry of structure makes the cyclone during its last stages slow-moving or stationary.

The warm, cold, and occluded fronts are now shown on the Norwegian weather maps, and forecasts are made in accordance with the principles of the Polar Front theory. In spite of its great successes in correlating many of the facts of cyclonic phenomena, the theory has not been completely confirmed by such observations as are available to test it, nor is it altogether free from theoretical difficulties. Other theories are held by many meteorologists, notably by the Austrian school under the leadership of F. M. Exner.

Complete daily weather maps of the entire northern hemisphere for the first four months of 1925, prepared by C. L. Mitchell of the U. S. Weather Bureau from all available data for that period, including the meteorological observations taken by Sverdrup on the S. S. *Maude* off the Siberian coast, have shown that during the colder months the principal region for the development of cyclones is apparently to the southwest of Japan, mainly over the China Sea, while among the principal regions of dissipation is western Siberia. Outbursts of polar air from the Arctic, leading to anticyclones, often of very great magnitude, are more frequent southeastward over the Mackenzie Basin, and in the vicinity of Nova Zembla.

Climatic Changes. Some investigators hold that the earth is undergoing a gradual desicca-

tion, but the consensus of the most expert meteorological judgment is that there is not as yet sufficient unimpeachable evidence to justify a belief in any *progressive* change of climate within historic times in any part of the world. Small and more or less periodic fluctuations, such as those accompanying the sunspot cycle,

LIFE CYCLE OF A CYCLONE ACCORDING TO V. BJERKNES

now exist, and can be traced back into the past through the evidence afforded by growth rings in large trees and other things; and the existence of well-marked local fluctuations of climate in the past is also well established.

So far as climatic changes during *geologic* time are concerned, there is a decided tendency to seek their explanation in purely terrestrial causes, with a lessened appeal to astronomical factors. The work of Humphreys and others has shown that dust veils in the very high atmosphere due to great volcanic explosions are effective in somewhat diminishing earth temperatures and may have been a contributing cause to the ice ages. C. E. P. Brooks, in particular, has sought to show that, under the right conditions, profound effects may follow a very slight initial change in temperature. For example, if the temperature in the polar regions happened at any time to be just above the freezing point of sea water, and if then, by a change in the distribution of land and water, the mean annual temperature in high latitudes were decreased by only two degrees, the ocean would freeze at the pole, cold water would flow away at the bottom until the entire ocean was cooled down, and an ice sheet would begin to form, and would automatically accelerate its own growth through its powerful and ever-increasing cooling effect until it ultimately extended to perhaps latitude 65°; the temperature at the pole might meanwhile have been lowered by as much as 45°. Conversely, a slight rise in the general temperature would suffice to cause the ultimate disappearance of the whole ice sheet; at the present time, a very small rise would clear the Arctic of ice, and there is evidence that the Arctic actually was clear of ice from about 500 A.D. to 1000 A.D.

G. C. Simpson, however, maintains that no redistribution of land and water, or of ocean

currents, could have produced a much higher or lower mean annual temperature over any limited region of the earth than can today be found somewhere on the same parallel of latitude.

Meteorological Physics. The aurora polaris presents a number of interesting problems, the solution of which may shed a great deal of light on conditions existing in the high atmosphere. In the ordinary polar aurora, the gases of the upper air are caused to emit the characteristic auroral radiations through the energy supplied by the impact of electrons coming from the sun. The so-called "negative" bands of nitrogen, due to ionized nitrogen molecules, so prominent in the auroral spectrum, require for their excitation an amount of energy equivalent to that possessed by electrons which have fallen through a potential difference of 20 volts; the "positive" bands, due to the normal nitrogen molecule, faintly present in the aurora, require less energy, but the line spectrum of the nitrogen atom, totally absent, requires considerably more. Hence the electrons which excite the auroral radiation must strike the upper atmosphere with about 20 volts energy.

The famous and enigmatical green line in the auroral spectrum was discovered by McLennan and Shrum to be due to oxygen; it is emitted during a transition of the dissociated oxygen atom between two "metastable" states. As Campbell, Rayleigh, Slipher, and others have shown, the whole night sky is always glowing faintly with this green light; the green glow of the night sky probably is not due to electrons from the sun, and it has been suggested that ultra-violet solar radiation is the responsible agent—molecular oxygen is dissociated into atoms, transformed to ozone, and then turned back to molecular oxygen again under the action of short-wave-length light.

Auroral streamers extending to altitudes of several hundred kilometers have been observed by Stormer. A diffuse aurora reaching 1000 kilometers was photographed in Norway on Sept. 8, 1926. Stormer has found that auroral rays situated more than 400 kilometers above the earth are always in regions then exposed to sunlight, while 96 per cent of those below 400 kilometers are in darkness; sunlight apparently has some action on the very high atmosphere that renders auroras visible to much greater heights than otherwise.

In developing further his theory of thunderstorms, Simpson has shown that lightning discharges always start from a positively electrified region, and progress outward from it, although the current is carried mostly by electrons that move in the opposite direction; the branches are directed away from the positive region. The majority of discharges start in the forward part of the thunderstorm cloud, where there is an accumulation of positively charged raindrops held up by the strong ascending air currents there: the flashes which branch upward are mostly hidden by the cloud, while many of those which branch downward fail to reach as far as the surface of the earth. Discharges from the earth to the cloud are less frequent; and when they occur, they usually appear thick and intense, the branches (directed upward) usually being hidden in the cloud.

Weather. For several years the American press gave considerable publicity to certain ill-founded predictions that the weather of 1927 would be so abnormal as to constitute a return

of the "summerless" year 1816, and so adverse to agriculture as to menace the nations' food supply. In no particular, however, did the weather of 1927 display abnormalities other than such as have occurred in the past and are to be expected somewhere every year; the summer as a whole was unusually cool over most of the country, August being especially abnormal, but no more so than has before been recorded, and the yields of most of the principal crops (with the exception of certain fruits) were close to, or above, normal, not only in the United States, but for the world as a whole.

An unusual amount of destruction was occasioned by West Indian hurricanes in 1926; one of them, first observed about 200 miles northeast of St. Kitts, W. I., on September 14, subsequently developed into one of the most severe tropical storms ever known to reach the coast of the United States; its centre, with the attendant temporary calm, passed directly over Miami the morning of September 18, the barometer sinking to 27.61 inches, and enormous damage and loss of life resulted. Again in 1928, great loss of life, damage to property, and destruction of crops were occasioned by hurricanes; two swept in from the West Indies over Florida, Georgia, and South Carolina in August, accompanied by high winds, torrential rains, and floods, while in September, one of the greatest hurricanes of record appeared: The force of this last storm, the most destructive since the Galveston hurricane of 1900, was felt during September 10th to 20th, over Martinique and Guadeloupe, the Virgin Islands, Porto Rico, the southern Bahamas, central Florida, and northward up the Atlantic coast to New Jersey and beyond, before it finally merged with an extratropical cyclone. The loss of life exceeded 3000, and about \$100,000,000 damage was caused; close to the centre, the wind velocity was probably about 200 miles an hour; the barometer reading at West Palm Beach, 27.43 inches, was the lowest sea-level pressure ever recorded in the United States during a hurricane.

Tornadoes sweeping eastward over Missouri, Illinois, Indiana, Kentucky, and Tennessee on Mar. 18, 1925, created a new record for the destruction of life and property by such storms; seven distinct tornadoes were reported, and resulted in the deaths of 792 people, the injury of 3033, and the destruction of \$18,000,000 in property.

METHODIST EPISCOPAL CHURCH. In 1928, throughout the world, there were about 19 different divisions of Methodists, aggregating about 11,629,950 members. The Methodist Episcopal Church of America was the largest branch. In the United States, the number of its members increased, according to the Federal Census, from 3,717,785 in 1916 to 4,080,777 in 1926, of whom, in the latter year, 2,212,180 lived in cities, and 1,868,597 in rural communities. On Nov. 1, 1928, the *Methodist Year Book* reported a membership of 4,152,177 in the United States, and a smaller representation in Africa, Asia, Europe, and Latin America. Much of the foreign work was carried on by the Board of Foreign Missions and the Women's Foreign Missionary Societies. In the United States, the church had 77 hospitals, and in 1926-27 it cared for 218,453 persons. There were, in 1928, 44 homes for the aged and 43 for children. One of the greatest agencies of the church, the Board of Pensions and Relief, had under its immediate care in 1927, 8530 retired ministers, ministers' widows, and ministers' orphans under 16 years of age. The annuity claim of this organization was \$4,413,915 in 1927. At the quadrennial General Conference, 1928, \$2,000,000 was raised for the work of the World Service, the benevolent organization of the Church. In the United States by 1928, there were 44 colleges and universities for white persons, and three junior colleges, with a total of 80,218 students; in the 29 secondary schools, there were 5606 scholars; and in nine theological seminaries, 1366. The church also supported, in 1928, three professional schools, nine colleges, four junior colleges, and four secondary schools for Negroes; the total enrollment of these institutions was 5891. Outside the United States, in the mission fields, were schools of all kinds, aggregating approximately 3000, with 146,000 pupils. The publishing interests of the Methodist Episcopal Church were conducted by the Methodist Book Concern, established in 1804. Average sales were about \$5,000,000 a year.

After many years' effort to unite the Methodist Episcopal Church and the Methodist Episcopal Church, South, the General Conference of the Methodist Episcopal Church voted in favor of union in 1924, but the following year the Southern church rejected the measure, and the union was not accomplished. Plans for union with the Methodist Episcopal Church, South, the divided Presbyterian Churches, and the Congregational Church were discussed at the conference of 1928, without positive results.

In Canada the Methodist Church formed one of the component bodies which united in the United Church of Canada in 1925. See CANADA, THE UNITED CHURCH OF.

METHODIST EPISCOPAL CHURCH, COLORED. The Colored Methodist Episcopal Church was organized in 1870 as a separate body under the oversight and care of the Southern church. According to statistics published by the denomination, the membership increased from 275,000 in 1914 to 333,002 in 1928; the number of preachers in 1914 was about 3000, compared with 2633 ministers in 1928. The number of pupils in the Sunday schools increased from 79,876 in 1917 to 192,800 in 1928; Sunday schools fell from 4007 to 2543. Churches increased from 3000 to 3579. The denomination supported six colleges and four high schools in 1926. In coöperation with the Methodist Episcopal Church, South, it maintained, in 1928, social service houses in four cities. The church published three periodicals.

METHODIST EPISCOPAL CHURCH, SOUTH. This branch of the denomination came into existence in 1845 through a division of the original Methodist Episcopal Church by General Conference action in 1844, when it became evident that the church could not find a policy on slavery acceptable to both sections of the country. The executive body is the College of Bishops which in 1928 had 13 members who hold office for life. It is the second largest branch of the church. The number of communicants increased from 1,996,877 in 1914 to 2,631,570 in 1928; the number of churches from 17,006 to 17,403; and the number of traveling preachers from 7203 to 8321. The number of Sunday-school pupils rose from 1,479,977 to 1,971,157; and members of the Epworth League from 133,380 to 263,884. The denomination maintained 248 educational institutions, chiefly in the South, including 32 universities and colleges, 23 junior colleges, 1 Bible and Missionary Training School, 21 academies, and 46 mission schools. Its Board of Missions superintended missionary work in Belgium, Brazil, Mexico, China, Czechoslovakia, Japan, Cuba, Korea, Siberia, and the Congo. Through the Centenary Movement projected in 1918, \$50,000,000 was raised for missionary work, and through the Christian Education Movement, inaugurated in 1920, \$20,000,000 was raised for educational work. In 1927 the contributions for all purposes amounted to \$43,026,473.

METHODISTS, Wesleyan. The Mother Church of the denomination and the principal branch in Great Britain and Ireland. It was founded in 1729, the first society was formed in 1739, and the first conference held in London in 1744. The church in 1928 was composed of five main conferences: Great Britain, Ireland, Foreign Missions, France, and South Africa. The membership figures of the denomination showed an increase from 922,796 in 1915 to 1,020,128 in 1928; the number of churches grew from 17,671 to 19,291, and the number of lay preachers from 30,221 to 37,882. The Sunday schools increased from 10,794 to 11,710, but the number of pupils dropped from 1,121,682 to 1,050,183, and the number of officers and teachers from 143,182 to 135,747. A publishing house was maintained in London.

Primitive Methodist Church. Known in England at first as the Camp Meeting Methodists. Church membership increased from 206,812 in 1915 to 222,744 in 1928, but the number of churches fell from 4903 to 4539, the number of ministers from 1149 to 1090, and the number of lay preachers from 15,537 to 13,284, and

the Sunday schools from 4204 with an enrollment of 447,050, to 3960 with an enrollment of 380,412.

United Methodist Church. A body formed in England in 1907. Membership in this denomination fell from 185,769 in 1915 to 146,802 in 1928, the number of churches from 3013 to 2208, the number of lay preachers from 6156 to 4724, the ministers from 848 to 545, and the Sunday schools from 2286 with 294,039 pupils and 40,744 officers and teachers, to 2062, with 237,269 scholars and 37,777 officers and teachers.

Wesleyan Reform Union. The membership of this denomination, which separated in 1850 from the Wesleyan Methodists was 8526 in 1915, and remained fairly stationary for several years, but by 1928 had increased to 10,875; the number of churches also increased from 206 in 1915, to 222 in 1928. The ministers numbered 25 in 1914, and 26 in 1928, and the lay preachers, 500 and 471, respectively, and the Sunday schools, 195 in the earlier year, and 224 in the later.

Independent Methodist Churches. Membership of this group which dated in Great Britain from 1796 increased from 9215 in 1915 to 10,825 in 1928, and the number of churches from 163 to 166, while the number of ministers decreased from 411 to 392.

Australasian Methodist Church. This denomination increased in membership from 149,878 in 1915 to 181,832 in 1928. During the same period, the number of churches dropped from 5147 to 4849, and the number of lay preachers from 8634 to 5689.

New Zealand Methodist Church. The strength of this denomination remained on the whole fairly even during the years between 1915 and 1928. Its membership shifted only from 24,218 to 24,624, the number of ministers decreased from 198 to 181, and the lay preachers from 928 to 749, the Sunday schools, however, increased from 411 with 29,917 scholars, to 438 with 30,570, and the number of churches rose from 459 to 910.

Japan Methodist Church. Church membership increased from 13,838 in 1915 to 29,420 in 1928, but the number of churches decreased from 245 to 162, and the ministers from 232 to 158.

METROPOLITAN OPERA HOUSE. See MUSIC, under *Opera*.

METZLER, WILLIAM HENRY (1863-). An American mathematician, born at Odessa, Ont., and educated at Toronto and Clark universities. From 1892 to 1894, he was instructor in mathematics at the Massachusetts Institute of Technology and then accepted a call to Syracuse, where in 1896 he became Francis H. Root professor of mathematics and head of the department. During 1911-17 he served as dean of the Graduate School and in 1921-23 as dean of the College of Liberal Arts. Since 1923 he has been dean of the New York State College for Teachers at Albany. Professor Metzler's original investigations, on which he published important results, included studies on symmetric functions, vanishing aggregates, and compound determinates. He served as editor of *The Mathematics Teacher* and the *Journal of Pedagogy*.

MEXICAN BEAN BEETLE. See ENTOMOLOGY, ECONOMIC.

MEXICAN IMMIGRATION. See IMMIGRATION; RACE PROBLEMS IN THE UNITED STATES.

MEXICO. A republic of North America with an area of 767,168 square miles, almost equal to the combined areas of Great Britain and Ireland, France, Germany, and Austria. Its total population, estimated at 14,889,905 in 1927, is 30 per cent less than the combined populations of New York and the New England States. In 1928 the total Indian population of Mexico was estimated at 4,179,472. Mexico City is the most important centre, with a population in 1923 of 633,367. It is the capital of the Republic and the chief centre of manufacturing, trade, and banking interests. Other important cities are Guadalajara, 143,376, a railway, manufacturing, and agricultural centre of the west coast; Puebla, 95,535; Tampico, 44,822, the most important oil centre and second port of the country; Monterey, 88,458; San Luis Potosi, 57,353; Vera Cruz, the chief port, 54,225; Merida, capital of Yucatan, 79,225; and Chihuahua, 37,078.

Industries. Mexico is known principally for its enormous mineral resources, but a very noticeable movement from the rural to the urban centres is apparent, and Mexico is becoming more and more a manufacturing nation. Before the outbreak of the revolutions, which began in 1910, Mexico was the leading industrial nation in the Western Hemisphere, south of the United States.

Petroleum.—Prior to 1910, mineral oil was a very small factor in the economic life of Mexico. In that year, the total oil production was 3,634,080 barrels. By 1914 it had jumped to 26,235,403 barrels, an increase of over 700 per cent. Despite political disturbances, which damaged all other industrial enterprises, petroleum production increased steadily from 1914 to 1921, when the peak of production was reached with an output of 193,397,587 barrels, valued at \$182,936,817. Because of exhaustion of old wells and the uncertainty of property ownership, production in the next two years was less. The 1922 production was 182,278,457 barrels (\$167,397,872); 1923, 149,529,088 (\$142,916,885); 1927, 64,121,000 barrels, and 1928, 50,150,610 barrels. The fact that the 1927 production was 29 per cent less than the 1926 production and that the output dropped 22 per cent in 1928 strengthens the belief that Mexico is pretty nearly through as an oil producer. She has already lost her position as ranking second to the United States in world production. The great decline in production is due to the encroachment of salt water and to the decreased drilling resulting from the refusal of the Government to grant permits to oil companies that had not complied with the law. See below under *History*.

Mining. The mineral resources of Mexico are enormous. Except for a short time during the most disturbed period of the revolution, Mexico was the leading silver producing country in the world. The Spaniards worked the silver mines in the early part of the sixteenth century, and the natives before them. The principal minerals are silver, gold, copper, lead, iron, and zinc, although there are also deposits of coal, platinum, mercury, manganese, antimony, sulphur, bismuth, and graphite. The five most important minerals produced in Mexico are silver, gold, copper, lead, and zinc. In 1914 production in general was at an extremely low ebb. After that year there was a very noticeable revival of production, but the 1928 output was valued at 699,308 pesos less than that for 1927. Legal restrictions and labor disputes were

given as the principal reasons for slackening production.

MINERAL AND METAL PRODUCTION

Product	1913	1923	1928
Gold	880	777	702
Silver	55,488	90,813	108,440

* Metallic content of ore extracted

Agriculture. About 6 per cent of Mexico's total area is available for agricultural purposes. Cultivated lands total 30,027,500 acres; pastoral lands, 120,444,200 acres; and forest lands, 43,933,200 acres. Public and confiscated lands totaling 10,680,000 acres had been distributed to 500,000 families under the agrarian laws up to Dec. 31, 1927. Of the area under cultivation in 1927, about 8,020,000 acres were devoted to corn, 1,227,000 acres to wheat, and 306,000 acres to cotton.

PRODUCTION OF PRINCIPAL CROPS

Crop	1910	1925	1926	1927
Wheat	9,266	9,550	10,333	11,519
Barley	5,198	3,802	4,302	4,574

Henequen	113 ^b	102 ^b		133 ^b
Chick-peas	38 ^b	61 ^b	82 ^b	80 ^b

* Unit, pound

^b Unit, metric ton

Cotton production in 1928 was 60,376 metric tons (132,826,320 pounds), the wheat yield was 300,211 metric tons (660,463,656 pounds), and the tomato production, 88,831 metric tons (195,427,388 pounds). In 1926 there were 5,584,802 cattle, 1,035,782 horses, 686,213 mules, 850,041 donkeys, 2,697,688 sheep, 5,423,959 goats and 2,902,949 pigs.

Manufacturing. Manufacturing in Mexico is limited but growing. The textile industry was, in 1929, the most important. In 1926 the 145 cotton textile manufactories had 30,500 looms, 780,000 spindles, consumed 41,500 metric tons of cotton and employed 43,199 workers. In 1929 there were 173 factories, employing 49,628 workers, and producing 39,554,000 kilograms of material annually. Other important manufacturing industries are boots and shoes, with an average annual production of 8,000,000 pairs from 771 plants; lumber works; flour mills, of which there were 197 producing 41,208,000 pesos' worth annually; hat factories, producing annually 11,000,000 pieces; many chemical industrial establishments. Five cement factories have a total annual capacity of 310,000 metric tons. Various difficulties kept native production down, and large amounts had to be imported annually. Sugar production was estimated at 180,000 metric tons during the 1927-28 season, as compared with 184,000 tons in 1926-27.

Commerce. The last year for which official figures were available was 1927. Imports then were valued at 346,588,000 pesos, and exports, including petroleum, at 624,364,000 pesos. (Two pesos equal one dollar.) In 1913, imports were

valued at 192,292,462 pesos and exports at 300,405,552 pesos. It is significant that, despite disturbed political conditions, Mexico's trade was maintained throughout the long period of revolutions. The year 1915 marked the lowest level; imports were 52,821,306 pesos and exports 251,202,988 pesos. The highest trade totals were registered in 1921, when imports were 508,074,097 pesos and exports 728,227,156. Principal Mexican imports are textiles, foodstuffs, iron and steel products, and various manufactures. The leading sources of imports are the United States, Great Britain, France, and Germany. Principal exports are crude petroleum, raw minerals, henequen (sisal), coffee, vanilla, and cotton. The chief countries of destination are the United States, France, Great Britain, and Germany. In 1913, Mexican imports were divided as follows: the United States, 50 per cent; Germany, 13 per cent; Great Britain, 14 per cent; France, 9 per cent; all others, 14 per cent. In 1926 these percentages were: the United States, 70.5 per cent; Germany, 7.4 per cent; Great Britain, 7.4 per cent; France, 4.6 per cent. In the same year Mexico's exports were divided as follows: the United States, 71 per cent; Great Britain, 7.1 per cent; Germany, 4.5 per cent; France, 2.3 per cent.

Communications. Beginning with the creation of the National Railways of Mexico in 1907, by which means the Mexican government acquired 55 per cent of the stock of many of the most important lines, government control was gradually extended until in 1924 practically all important lines in Mexico were merged into one system, controlled and operated by the Government. On Jan. 1, 1926, the railways were returned to private management under Government supervision. In 1927 Mexico had a total of 19,086 miles of railway lines. Direct rail service between the west coast and Mexico City and from Guadalajara to the Arizona border was provided with the completion of the Southern Pacific lines between Tepic, Nayarit, and La Quemada in 1927. Statistics for the National Railways are given in the accompanying table. There are in Mexico 84,292 miles of telegraph wires and 130,265 miles of telephone wires. In 1926, 57,563 telephones were in service.

STATISTICS OF THE NATIONAL RAILWAYS OF MEXICO

	1913	1923	1926
Length of line	miles 6,089	8,440	8,473
Locomotives	number 729	1,172	1,982

Finance. Government revenues for 1927 were 306,872,517 pesos and for 1928, 300,506,615 pesos, as compared to estimated revenues for the two years of 334,342,229 pesos and 290,000,000 pesos. Expenditures in 1927 were estimated at 326,000,000 pesos and in 1928 at 296,000,000 pesos. The estimates for 1929 were: revenue, 288,428,600 pesos; expenditure, 288,013,392 pesos. Receipts from import duties mounted from 64,-

983,871 pesos in 1927 to 73,822,291 in 1928 and the income tax returns rose from 17,460,825 pesos in 1927 to 19,273,036 in 1928. The 1928 tax on petroleum production brought only 6,780,307 pesos, as compared to 13,053,403 in 1927.

During January, 1927, the Mexican government twice borrowed from the International Committee of Bankers of Mexico to complete payments on its foreign debt service and the year closed with the Government in arrears on the scheduled payments. The Secretary of the Treasury also announced the impossibility of meeting interest on the public debt in 1928. According to the International Committee, the funded debt, in default since 1914 except for 75,000,000 pesos paid between 1923 and 1927, was 1,091,429 pesos on Jan. 1, 1928. Of this, the Republic owed 872,913,327 and the National Railways, guaranteed by the Government, owed 263,435,903 pesos. The floating debt was 161,500,500 pesos, in addition to which there were outstanding Agrarian bonds of 220,000,000 pesos and damage claims by foreigners of 270,000,000, making a total of nearly 2,000,000,000 pesos.

Education. The school system in Mexico is largely under government control. From 1896, earnest attempts were repeatedly made to better the general standard; lack of funds and disturbed political conditions interfered seriously with projected improvements after 1910. The Constitution of 1917 made school attendance compulsory for all children under 15 years of age. This same document forbade the establishment or direction of primary schools by religious bodies of any denomination, but there remained a comparatively large number of such schools established throughout the country. In recent years, states passed individual laws aimed at religious schools, but these were not rigidly enforced. See below under *History*.

In 1928, the Secretary of Education published the following statistics, somewhat incomplete, on the status of the schools throughout the Republic on October, 1927: Total number of schools was 15,479, divided as follows: Kindergartens, 378; rural schools, 10,136; other elementary schools, 4467, secondary and preparatory schools, 67; normal schools, 65; professional schools, 57; schools of fine arts, 23; and technical, industrial, commercial, and vocational schools, 278. Schools supported by the Federal government were attended by 252,988 boys and 161,276 girls, while in those supported by the states and municipalities, there were 402,616 boys and 348,525 girls. Pupils in private schools numbered 17,298. The total for the nation was therefore 1,183,333. On July 1, 1928, the university enrollment was 9379. See *IMMIGRATION*.

HISTORY

From the accession of Gen. Victoriano Huerta as provisional president on Feb. 18, 1913, until the defeat and flight of Adolfo de la Huerta in 1924, Mexico passed through a series of revolutionary disturbances in which foreign economic interests, especially those of the United States, were so significantly involved as almost to overshadow the domestic issues. From the outset, the Huerta government was in ill favor with the Washington administration, partly because Huerta was considered to have been responsible for the killing of the deposed President Madero, on Feb. 23, 1913; partly because President Wilson believed Huerta's rule to be an obnoxious "military despotism"; and partly, as the letters of

Walter Hines Page disclose, because a strong suspicion prevailed at Washington that Huerta was merely the tool of Lord Cowdray, the British oil magnate. By refusing to recognize Huerta, President Wilson had made it almost impossible for the provisional government to borrow money. By lifting the embargo on arms, on Feb. 3, 1914, the American government gave valuable assistance to the rebels, for they controlled the north and alone could purchase munitions in the United States.

It is doubtful whether the ensuing struggle between Huerta's Federalist forces and Carranza's Constitutionalists was plainly between despotism and democracy. The conflict was really due to a complexity of interacting causes, in which could be discerned the ambitions of military leaders, the meddling of foreign interests whose great property rights made Mexico a peculiar concern, etc. President Wilson's "watchful waiting" policy materially influenced the outcome. Huerta was soon beset by enemies on the north, the west, and the south. The *coup de grace* was struck when American suspicious aloofness turned into direct interference. The arrest of American marines bound on a peaceful errand at Tampico on April 9 was immediately apologized for, but Admiral Mayo's insistence that a salute be rendered to the flag, in which he was reluctantly supported by Wilson, and Huerta's refusal unless the Mexican flag be similarly saluted, led to the break.

On April 21, American marines landed at Vera Cruz and seized the customhouse, 18 being killed and 70 wounded in the ensuing fighting. The storm of resentment was universal in Mexico. Carranza might have joined Huerta in defying the United States had it not been for the cooler counsels of Villa. Mediation by Argentina, Brazil, and Chile failed to find a solution, and in July Carranza's generals met and decided to continue fighting Huerta. This turn of affairs hastened Huerta's fall; he resigned on July 15. His successor, Francisco Carbajal, remained in office less than a month. On August 13, a protocol was signed arranging for the peaceful capitulation of Mexico City. On August 15, General Obregon rode into the capital at the head of 15,000 men and on August 20, Carranza made his triumphal entry.

Carranza's accession failed to inaugurate the peaceful reign of democracy. The bandit Zapata continued his lawless activities and different generals headed separate revolts. Villa, who declared war on September 23, was the most formidable. When the fighting showed no decisive results, Carranza called a convention of military delegates, who at Aguascalientes on October 30 decreed the retirement of both Carranza and Villa and elected Gen. E. Gutierrez provisional President. Carranza refused to heed the decree, established himself at Puebla, abandoned the capital to Zapata and Villa, and occupied Vera Cruz, which the Americans had evacuated.

For the next two years, the history of the country is the story of the varying fortunes of Villa and Carranza, of Constitutionalists and "Conventionists." A third party, for a brief time, was injected into the squabble when Gutierrez, who had been unseated on Jan. 17, 1915, gathered a force and established headquarters at Pachuca. Although, in February, Villa defeated both Gutierrez and Carranza at San Luis Potosi in separate battles, his star soon began to decline. In three disastrous attempts to capture Celaya from

General Obregon, he lost more than 20,000, killed and wounded. In May, he had to give up Monterey and suffer defeat at Paredon and Trinidad Station.

In all these forays, Mexico City was always the focal point, being taken and retaken by the opposing forces, to the serious injury of the population, native and foreign. The plight of the city and foreign protests over destruction of life and property caused President Wilson to issue a declaration of policy in which he held out a promise of aid to any party capable of winning a decisive victory. On invitation of the United States, the representatives at Washington of Argentina, Brazil, Chile, Bolivia, Guatemala, and Uruguay assembled in a conference for the consideration of Mexican affairs, and on August 11 called on the warring factions to get together to discuss their differences. Villa consented, but Carranza refused. The conferees met again in New York on September 18 and decided that recognition would be accorded that group which could give evidence of power to protect life and property. Three weeks later, they accorded *de facto* recognition of Carranza, Colombia and Nicaragua joining a little later. Immediately after, 200 of Zapata's officers laid down their arms, and Gutierrez likewise surrendered. Villa alone remained. His next move was startling and could be interpreted only as the result of a desire to force American intervention. On Jan. 11, 1916, a band of Villaists stopped a train near Santa Ysabel, removed a party of 19 engineers on their way to open a group of mines, and in cold blood killed all but one.

Indignation in the United States reached fever heat. Resolutions were immediately introduced in Congress demanding intervention; the President's "watchful waiting" policy was strongly attacked. Only calmer counsels prevented the passage of the resolutions and the forcing of the President's hand. Information divulged by Secretary Lansing indicated how precarious was the position of Americans in Mexico and on the border. Figures showed that 76 Americans had been killed in the three years preceding Jan. 1, 1916. Of these, 24 had been killed from causes arising directly out of revolution, 44 by bandits, Indians, and civilians; and 8 in a railroad accident which was a result of the disorders. Between 1913 and 1915, 20 American civilians, 16 American soldiers, and 62 Mexicans were killed on the American side of the border.

Two months later the events occurred which led the United States to intervene directly. On March 9, the border town of Columbus, N. M., was suddenly raided at night by some 1500 Villistas, and 11 civilians and 9 troopers were killed. With the almost unanimous consent of Congress, the President dispatched a punitive expedition under General Pershing across the border in hot pursuit of Villa. Carranza's conduct throughout the preceding discussions had been extremely ungracious. Conditions laid down by him, though onerous, were accepted; the pursuing forces were not to cross the line within six miles of any town on the border or to occupy any city or town; railroads could be used only in case trains were not guarded. From Casas Grandes, three divisions of troops radiated in different directions. Near Guerrero, a clash took place which resulted in the rout of Villa and his men. The most important conflict, during the chase, ironically enough, took place between Americans and official Mexican troops. On April 12, a detachment of cavalry,

about to encamp outside the city of Parral, was suddenly attacked in the rear and both flanks and compelled to retire to a nearby village for shelter. Only the arrival of reinforcements at nightfall prevented the occurrence of what might well have been a tragedy.

Villa, however, was not heard from, though the American occupation continued. In May, Generals Scott and Funston met with Generals Obregon and Trevino, but without result. On May 22, Carranza, in a long note in which he questioned the sincerity of American purposes, demanded the immediate withdrawal of the American troops. The American reply was the sending of all available regulars to the border and the calling out of the militia of Texas, Arizona, and New Mexico. On June 18, the entire organized militia and national guard of all the other States were called into the service. By July 31, 112,000 militia troops were transported to the border. Border raids continued from time to time, and small detachments occasionally crossed the boundary line in pursuit. On June 20, Secretary Lansing replied to Carranza and bluntly refused the withdrawal of the American troops. On the same day, American troops were attacked at Carrizal by Mexicans and after a hot fight were compelled to retreat. The Americans killed and wounded numbered 16; the captured, 24. A few days later, the prisoners were released. During the following month, the American troops gradually withdrew northward. On July 4, in a note to the State Department, Carranza suggested mediation on the part of Latin-American countries as a way out of the difficulties. From Sept. 15, 1916, to Jan. 15, 1917, a commission assembled in the United States, but it was made up of only American and Mexican delegates. While the commissioners sat, civil war again broke out. In October and November, 1916, Villaists were active in the neighborhood of Chihuahua. During the prolonged sittings of the commission, it became evident that the only real question under discussion was the right of the United States to send punitive expeditions into Mexico. On November 24, a protocol was signed by all the delegates which called for American withdrawal in 40 days, though the United States reserved the right to pursue bandits who had invaded American territory. It was not clear in 1917 just what had been accomplished. Mexico refused to accept the protocol; the problem of guarding the American border was left unsolved, and those larger questions of international relations which had been the peculiar concern of President Wilson were not touched on. On Feb. 5, 1917, the withdrawal of troops from Mexico was complete, and the militia on the frontier was rapidly being reduced about the same time that Henry P. Fletcher, American Ambassador, left for Mexico.

On Oct. 22, 1916, delegates had been elected to the Constitutional Assembly. This body, representing only adherents of a *de facto* government, met at Queretaro on December 1, and by Jan. 31, 1917, it had completed a new fundamental law. The document contained many advanced provisions, the presidency could be held for only a single term; suffrage was to be universal without distinction of sex, a radical labor code provided for an eight-hour day, the minimum wage, compulsory profit sharing, and a free employment bureau; the religious orders were expropriated, their churches, schools, and hospitals confiscated, and the schools secularized. The most famous provision, Article 27, restored communal lands

to Indian villages; authorized each state or territory to fix the maximum area which any person might own and to subdivide excess holdings; deprived religious organizations of the right to own land; and, probably most important of all, declared ownership of all minerals and petroleum resources to be vested "in the nation." Only Mexicans by birth or naturalization were to have the right to acquire ownership of lands or to obtain mineral and oil concessions; foreigners could receive such rights only by agreeing to renounce their rights of appeal to their home governments.

On Mar. 11, 1917, Carranza was elected President. Most of the events of the next three years hinged on Article 27. It had been incorporated in the constitution against Carranza's wishes and as a result of the agitation of the more radical followers of Obregon. Immediately on its promulgation, state after state formed agrarian commissions which proceeded to confiscate and redistribute the land in the interest of the Indian peons. Carranza, in order to check these local commissions, found it necessary to appoint a National Agrarian Commission for the administration of the matter on a more scientific basis. It thus became evident that something like an agrarian revolution had been started. International complications soon arose to thwart this attempt at putting the Mexican house in order. The nationalization of the subsoil struck at the foreign ownership of the very rich oil fields in Mexico.

On Feb. 19, 1918, the Mexican government proceeded to inaugurate this policy by imposing area taxes and ground taxes on foreign concessions. Other decrees of a similar purport followed during the year. Protest, of course, was inevitable, and, as events proved, unavailing. On April 2, Mr. Fletcher, on behalf of the American government, filed a note declaring that "the seizure of property at the will of the sovereign without legal process equitably administered and without provision for just compensation has always been regarded as a denial of justice and a cause for diplomatic representation." The refusal of foreign operators to conform with the governmental decree was followed by a refusal to issue drill permits. The lower Mexican courts upheld the Government; not until much later was the air cleared. Appeal taken to the Supreme Court finally brought in 1922 the decision that while under Article 27 the right of ownership by the state to all subsoil resources could not be questioned, nevertheless all individuals and companies who had purchased properties for the express purpose of exploiting their mineral and oil deposits were to be protected in their private rights. The retroactive character of the article was therefore disclaimed. On this basis, drilling permits were once more issued in 1922, and partial operations were inaugurated after a four-year cessation of activities.

The ensuing years of Carranza's administration could hardly be characterized as fulfilling the high democratic hopes entertained for the Constitutional movement. Peace, of course, Mexico never enjoyed. Banditry continued to operate in defiance of the Mexican soldiery, though possibly with their connivance, too. In reprisal for Mexican outrages, American border troops often found it necessary to cross the frontier in pursuit of raiders. During 1919 alone, more than 300 serious outbreaks were reported to the Senate Committee on Foreign Relations. A particularly flagrant act was the capture and

holding for ransom of William Jenkins, a United States consular agent, on October 19. Despite the strong protests of the State Department, the Mexican government refused to release Jenkins on the ground that he was implicated in his own abduction. On December 4, however, he was suddenly set free. While commerce increased under Carranza and taxes were being collected more widely than before, anarchy in government was conspicuous. Official corruption flourished; dissension among the leaders added to the prevailing unrest; the constitution, with its radical pretensions, was flagrantly disregarded. How unstable affairs were, the events of 1920 indicated. As the presidential election campaign progressed through 1919 and 1920, it became evident that Obregon, with the support of the army, the radicals, and the foreign interests, was going to win over Carranza's nominee. Carranza's action was typical. Obregon was summoned to Mexico City under arrest. Meanwhile the state of Sonora had broken out into open revolt because of Carranza's attempt to control it. By the end of April, the West and North were under arms. In the interim, Obregon had made his way safely from Mexico City to the insurgents' camp and was in the field. On April 23, the revolutionists proclaimed a new provisional government with Adolfo de la Huerta as President. On May 7, after the city of Vera Cruz had capitulated to the insurgents, Carranza fled from the capital and made for the seacoast, ostensibly to escape the country. His flight was impeded at almost every step. On May 21, after having surrendered himself to the troops of General Herrera, he was treacherously shot and killed while asleep in a hut near the village of Tlaxcalantongo in Puebla.

On May 24, 1920, the Mexican Congress chose Adolfo de la Huerta as provisional President. In the September election, Obregon was victorious, meeting with only a nominal opposition. He was inaugurated on December 1. Obregon's administration was marked by steady progress. His sympathies with labor and the agrarian elements were indicated in legislation designed to further their prosperity through the enforcement of the labor code and the agrarian articles of the constitution. The restoration of lands formerly held by villages and tribes, which had been expropriated by individuals, steadily proceeded, and so did the partitioning of the great estates. During the first half of 1923 alone, over 600,000 acres were restored and 1,500,000 acres turned over to peasants by the Mexican Agrarian Commission. Federal lands, including water rights, were thrown open to homesteaders. No attempt was made to interfere with the Socialist régime of Governor Corrallo in Yucatan. From 1921, the rehabilitation of the railways made a continuous advance; even building was undertaken on a large scale. The army was reduced to 50,000 men, and the pay of the official bureaucracy was cut.

A consistently friendly attitude was displayed toward foreign nations and their nationals. On July 13, 1921, President Obregon invited all interested countries to send representatives to constitute a permanent Mexican Claims Commission; in November, France, Great Britain, Italy, Spain, and the Netherlands accepted. Steps were taken to clear up the tangle of the national debt. In September, 1921, Thomas W. Lamont of J. P. Morgan & Co. arrived in Mexico for the purpose of effecting arrangements for the funding of the bonds held by Americans, British, French, Dutch, and Belgians. The accrued interest on

Mexican external bonds now amounted to some \$200,000,000. In September, 1922, an agreement was reached with the international bankers by which the Mexican government pledged itself to set aside annually for the service of the debt the entire proceeds of the oil export tax, 10 per cent of the gross revenues of the national railways, and all the net operating revenues of these railways. Late in 1922, the first interest payment on the bonded indebtedness was deposited in New York. Nothing exhibited better the honest purposes of the administration than the attitude adopted toward Article 27.

In spite of an active interventionist propaganda carried on in the United States by oil interests, to which Senators King and Fall lent their influence, Obregon refused to be turned from his course. He declined to formulate a treaty with the United States, based on the recognition of American property rights, before his own government was recognized. In 1922 he signed a decree declaring that Article 27, in accordance with the decision of the Mexican Supreme Court, was not retroactive; but further concessions he would not make. The responsibility for nonrecognition now shifted to the United States, for Mexico had met all foreign demands relative to the external debt, the outstanding claims, and the retroactive character of the offensive constitutional article. The United States delayed until the spring of 1923, when two American commissioners were dispatched to Mexico City to treat with the Government. During the course of the ensuing negotiations, the Mexican government evinced a conciliatory disposition by enacting a new petroleum law on April 26; it confirmed the validity of concessions obtained before May 1, 1917, but required concessionaires to revalidate their claims within three years.

Likewise, Obregon endeavored to facilitate a settlement of the land problem by increasing the size of estates permitted to individual owners and by granting immunity from expropriation to large irrigation companies having colonization contracts with the Federal government. A provision for indemnification, in public bonds, of landowners who had suffered from confiscatory measures between 1913 and 1917, failed to satisfy the American commissioners, who demanded payment in money. Not until August 15 was a final agreement reached.

In regard to oil and minerals, the subsoil rights acquired and exploited by American companies before May 1, 1917, were validated, but the provisions of the constitution were to be applied after that date. The same understanding was applied to agrarian lands, so that all titles acquired after 1917 were subject to the agrarian reform laws. To this agreement were appended conventions calling for the creation of two mixed-claims commissions, one for the settlement of American claims arising from disorders of the revolutionary period, the other to deal with all other claims of nationals of either country against the other.

In accordance with this agreement, the United States formally recognized the Obregon government on Aug. 31, 1923. France quickly followed suit, but the British Foreign Office continued to withhold recognition, perhaps because of uncertainty regarding the security of British oil interests. On its part, the Mexican government carried out the agreement in regard to oil rights by a decree dated Nov. 10, 1923; subsoil rights acquired and exercised, or about to be exercised,

prior to the promulgation of the constitution in 1917, were respected, but henceforth in all titles to land included in the national domain, the nation's ownership of subsoil resources was to be expressly reserved. The land agreement did not prevent energetic continuation of Obregon's programme of land reforms. On the contrary, almost 300,000 hectares were distributed between August 4 and November 20, under a decree permitting landless citizens to claim homesteads on public land.

The agreement with the United States was undoubtedly the outstanding event of the year 1923, but notable also were the adoption of a budget allotting \$15,000,000 for payment on the international debt account, the assassination of the once prominent revolutionary leader, Francisco Villa, on July 20, the expulsion of the papal representative, Mgr. Filippi, and the beginning of a momentous electoral campaign. The two last-mentioned occurrences require further notice. Mgr. Filippi incurred the displeasure of the Government by participating in an open-air religious ceremony to celebrate the laying of the cornerstone of a shrine in defiance of the orders of the governor of the state (Guanajuato). The Federal government promptly supported the governor in his prohibition of Catholic ceremonies out-of-doors, and Mgr. Filippi was compelled to leave Mexico at once.

This episode evoked protests not only from the Vatican but from Roman Catholic organizations in Mexico itself and in other countries, but it was only one of numerous anti-clerical measures. The law passed by the Durango State Legislature later in the same year, limiting to 25 the number of clergy for each religious denomination in the state, which at that time had over 200 priests, was a typical manifestation of the anti-Catholic feeling prevalent among many of the local politicians. Such interferences with religious liberty alienated many of Obregon's supporters and were in some measure responsible for the organization of a counter-movement, modeled on the plan of the Italian Fascisti, to defend, among other things, the interests of the Catholic Church.

The presidential campaign, in anticipation of the elections scheduled for July 6, 1924, was begun quite early in 1923 and soon overshadowed all other interests. President Obregon himself was debarred from becoming a candidate for reelection under the terms of the constitution of 1917, but two members of his cabinet appeared as candidates for nomination by the government party, the Coöperatistas. General Plutarco Calles, resigning his post as Minister of the Interior, appeared first in the field, in September, and anticipated an easy victory as President Obregon's personal choice; but a majority of the Coöperatista Party, it developed, preferred the Finance Minister, Adolfo de la Huerta, who had played a conspicuous rôle in the recent negotiations with the United States. After seemingly hesitation, de la Huerta yielded to the promptings of his friends, resigned from the ministry, and in October entered the lists against Calles. President Obregon now hastened to support his protégé, Calles. Through the new Finance Minister, Alberto Pani, Obregon accused de la Huerta of gross extravagance and responsibility for Mexico's virtually bankrupt condition. Nevertheless, the Coöperatista Party, assembling in convention at Mexico City, defiantly nominated de la Huerta as its candidate, and the latter promised to stand

on the Coöperatista platform of promoting co-operative enterprises, indemnification of landowners for estates divided among the peasants, and protection of municipal home rule.

The Social Reform Party, the National Independent Party, and several other organizations likewise rallied to de la Huerta's standard, in support of what might be called liberal conservatism, i.e., agrarian reform of a moderate type. General Calles, on the other hand, was nominated by the National Agrarian Party, and pledged himself not only to maintain the constitution but also to carry out the agrarian reform in a thoroughgoing fashion and to champion the interests of the workingmen. A minor candidate was General Flores, nominated by the Reformed Revolutionary Party. Meanwhile excitement had been raised to an extraordinary height by various provincial elections, important because each faction was eager to control the local governmental machinery and thus to secure victory in the coming national contest. In several of these local contests, blood was shed. Claiming that the Federal administration was interfering in the state elections and violating state sovereignty, the de la Huerta faction resorted to desperate measures. On Dec. 5, 1923, they issued the Plan de Vera Cruz, a plan for a new insurrection, and at once the military forces in the states of Vera Cruz, Chihuahua, Michoacan, Tamaulipas, and San Luis Potosí accepted the call to rebellion. Once more the country fell a prey to civil war, with all its accompaniments of banditry, confiscation, and "executions." The rebels soon gained other states, Yucatan, Oaxaca, Guerrero, Guanajuato, Jalisco, Colima. Their armies moved against the capital. In the provinces, the movement clearly revealed its conservative character; its energy was directed hardly less against "reds" and labor unions than against the Obregon government. Ostensibly, however, the aims of the rebels were declared by de la Huerta to be the respect of life and property, legislation regarding the rights of labor and capital, indemnification for expropriated landowners, respect of elections, abolition of the death penalty, woman suffrage, and educational reform.

Other reasons for the rebellion were later divulged, or alleged, by President Obregon. Officials of the Aguila Oil Company, it was charged, had aided the de la Huerta forces, although on the other hand, Doheny, American oil operator, admitted lending the Obregon government \$5,000,000 to suppress the rising; there was some ground for suspecting, therefore, that this new civil war, like some of its predecessors, was at least tainted with oil. Yet another cause of the break between Obregon and his former lieutenant was disclosed by the President; during the Lamont negotiations of 1922, de la Huerta had obtained Obregon's consent to an otherwise unacceptable debt settlement by telegraphing to him the news, subsequently revealed to be untrue, that Lamont had guaranteed the basis of a new bank to aid in the financial reconstruction of Mexico. Without this bank, the debt settlement had proved unduly burdensome. In the light of this charge, it seemed almost paradoxical that the United States government should have favored Obregon against de la Huerta; yet such was the case. The United States government sold arms to Obregon, refused arms to the rebels, and threatened a naval demonstration against the latter in January, 1924.

Thanks in part to the benevolence of Washington and also to the loyalty of large elements in

the Mexican population, notably of organized labor, Obregon emerged victorious. Although several notable successes were achieved by the Huertista forces under their able commander, General Estrada, in December, 1923, the tide soon turned. The Federal forces recaptured the important railway centre of Puebla on December 22 and began to press back the lines which had been closing in on the capital. Throughout January, 1924, the opposing armies were deadlocked. Early in February, Obregon's troops took the seaports of Vera Cruz and Tuxpan; soon afterward Guadalajara fell; the states of Michoacan, Guanajuato, Jalisco, and Colima were reclaimed; several of the insurgent armies were dispersed, and their commanders captured or put to flight. By the end of March, the rebels had lost all except portions of Yucatan, Campeche, Tabasco, and Chiapas, and the outcome had become sufficiently clear to warrant Charles B. Warren in presenting his credentials on March 31 as Ambassador from the United States. In April, Yucatan and Chiapas were cleared of rebels. De la Huerta himself fled from Mexico. Rounding up the remnants of the once imposing Huertista army was a slow process, but it had been virtually completed by the date set for the presidential elections, July 6.

One unfortunate aftermath of the Huerta rebellion was the failure of the Mexican government to meet the payments due on June 30 under the Lamont-de la Huerta agreement. Not only had the civil war made heavy drains on the Treasury, but, President Obregon explained, he had been unable to obtain a foreign loan; moreover, the obligations incurred by the agreement were accepted on the basis of de la Huerta's "false" statement that he had obtained the promise of a loan for irrigation works and for the establishment of a central bank of issue. Failing this loan, it had been impossible, even by the most drastic economies and sacrifices, to fulfill the bargain of 1922.

With de la Huerta eliminated, General Calles was able to enter the elections without formidable opposition. Calles himself had suspended his political campaign to serve in Obregon's army against the insurgents and resumed his candidacy only in the last week of March, 1924, after the danger had been averted. More distinctly than ever he was now stamped as the approved candidate of the Obregon government; and more than ever, in view of the Huertistas' attacks on labor radicalism, he was supported by the working classes as well as by peons hungry for land and by the middle-class liberals. He openly endorsed the radical land-reform policy of Emiliano Zapata, thus winning favor with the peasantry. He voiced a wish that wages in Mexico might be as high as in the United States, a wish that was not less effective politically because it was utopian. Yet, he took pains to dissociate himself from Bolshevism or "red" Socialism. His opponent, General Flores, stood on a platform of "progress, order, and honesty," and was generally supposed to enjoy the support of conservative business and landed interests, the moderate wing of the working class, the moderates, and Catholics of clerical tendency. The election was held on July 6 in what for Mexico may be considered an exceptionally peaceful manner. It resulted in an easy victory for Calles. During the five months' period before he assumed office, the President-elect went on a tour of Europe and the United States. In addresses made on this tour,

he expressed his admiration for the United States and his good will toward Americans, especially the laboring classes. He proclaimed that his principal task as President would be to "raise the social conditions of the laboring classes to a higher plane."

During the latter part of 1924, relations between Mexico and the United States considerably improved, as evidenced by the arrangement of a postal convention between the two countries, discussion of a commercial treaty, etc.; but with Great Britain, a highly strained situation which had arisen out of the Mexican government's demands in May and June for the withdrawal of the British representative, Mr. H. A. C. Cummins, became worse. Mr. Cummins was charged with addressing insulting letters to the Mexican government relating to attacks by brigands on an Englishwoman, Mrs. Rosalie Evans, on her property in the state of Puebla. The British government finally recalled Mr. Cummins and broke off diplomatic relations, and President Obregon closed the Mexican consulates in London, Liverpool, and Glasgow. With Japan, cordial relations were signalized by the signing of a treaty of friendship and commerce on October 8, and with Russia, by the presentation of credentials by S. Petkovsky, new Russian Soviet Minister to Mexico, on November 16.

Inaugurated President on Nov. 30, 1924, General Calles indeed faced a situation filled with difficulties. Here and there, the fires of revolt were still smoldering. The agrarians, made arrogantly assertive by the division of the great estates, were guilty of frequent excesses. The Treasury was empty, salaries of government employees were months in arrears, service on the foreign debt was suspended. Although the United States had faithfully supported Obregon in the revolution, its conservative government was waiting with reserve to see what course his reputedly more radical successor would take. President Calles addressed himself to his task with a characteristic vigor and forthrightness which at once stamped his administration with a strongly positive character and raised up enemies in so many directions that for a while his position was highly precarious. His announced programme included first of all a restoration and maintenance of public order, then the rehabilitation of the country's finances, and finally the furtherance of social reforms, including especially the continued division of the land and especial attention to the education of the Indians and all the poor. Scattered bands of rebels and bandits in the outlying districts were followed up and brought under federal control.

The new policy of retrenchment in government expenditures quickly became operative. Hundreds of superfluous employees were dismissed, the expensive officer list of the army was drastically cut, the number of troops reduced, and waste in many other directions eliminated. As a result, government finances showed a rapid and progressive improvement. Civil employees were paid in full in February. By the end of March, a Treasury surplus of 18,000,000 pesos was shown and by September 1, the President was able to report a reduction in the deficit from 41,600,000 pesos to 14,300,000 pesos through the payment of back salaries and other old debts, and a net surplus of 25,500,000 pesos.

While the administration was distinctly a labor government, it took a firm stand against the more radical labor tendencies. On May 5, President

Calles vigorously denied a statement by M. Tchitcherin, Soviet Foreign Minister, that the recognition of Russia by Mexico had made the latter country a base for communist propaganda. The threat of a general strike in May in sympathy with an oil-workers' strike in Tampico brought from him the statement that he would use all the force at his command to prevent disorder. On the other hand, the Government supported several strikes, including a number against foreign-owned companies. It was one such strike which initiated a long period of conflict with the United States. In April, the state of Vera Cruz seized the plant of the American-owned light and power company of Jalapa, where the employees were on strike, and the Federal government, replying to a note of protest from Ambassador Sheffield, upheld the action. Mr. Sheffield went to Washington to confer with the President and the Secretary of State. On June 12, Mr. Kellogg announced that conditions in Mexico were unsatisfactory and that the United States would continue to support the Calles government "only so long as it protects American interests and lives and complies with its international engagements and obligations." He further mentioned reports of revolution in such a manner as to imply possible American support. The statement brought an immediate and spirited response from President Calles to the effect that American property was being protected and that Mexico "does not accord to any foreign country the right to intervene in her domestic affairs."

In May and June, the new administration faced serious domestic difficulties. Agrarian radicals were seizing land illegally and had to be sternly suppressed. Rebel plots, including one to assassinate the President, were uncovered. The Roman Catholic Church was alienated by the Government's reported support of a strong separatist movement, but the administration maintained its position stoutly against these various perils, and the midsummer crisis was safely passed. Diplomatic relations with Great Britain were resumed in September.

In the closing months of 1925 a controversy with the United States developed which, during the following year, was to become extremely acute. This was a dispute over two laws relating, respectively, to ownership of land and oil in Mexico, by foreigners, which were passed in December to bring into operation provisions of Article 27 of the 1917 constitution. The land law prohibited all ownership of land and water by aliens within 100 kilometers of an international boundary or 50 kilometers of the coast, as well as possession of stock in any company owning land in those zones. Elsewhere, aliens might hold stock in companies owning land, mining concessions, etc., provided they would regard themselves as Mexican citizens insofar as this ownership was concerned and renounce the right of protection by their own governments; but aliens might be only minority stockholders where land was used for agricultural purposes, and they were required to reduce their holdings to 49 per cent or less in such companies within ten years.

The petroleum law reaffirmed the Government's ownership of all oil in its natural deposits and required owners of petroleum properties to apply for confirmation of their titles, the understanding being that full ownership rights would be replaced by concessions to run fifty years from the time exploitation had begun. Through Ambassador Sheffield, the United States at once protested

(January, 1926) that the laws were retroactive and confiscatory and conflicted with the guarantees given when the Obregon government was recognized in 1923. A long series of notes followed, the controversy finally reaching the stage where Secretary Kellogg, on October 30, stated that he wanted to point out so clearly as to leave no room for misunderstanding the extremely critical situation affecting the relations between the two countries.

The petroleum law went into effect on Jan. 1, 1927, and the land law on January 21. The latter was generally complied with, and controversy over it died out. Under the former, however, President Calles revoked the drilling permits of a number of companies which had not applied for confirmation of their titles. A temporary court injunction kept them in operation for a while, and the Government showed no great zeal in pressing its policy. A spirit of conciliation in the attitude of the American government brought a quick response from Mexico. The cause of the controversy was finally removed entirely when the Mexican Supreme Court, in November, 1927, declared certain provisions of the law unconstitutional and the Mexican Congress in December repealed them.

Early in 1926, the Government was confronted with another controversy which quickly took on major proportions. This was the conflict which arose with the Roman Catholic Church in January and February of 1926, when the Episcopate repudiated Articles 3, 5, 27, and 130 of the constitution making all church buildings the property of the state, prohibiting religious schools, and barring alien ministers of religion. The Government responded by announcing that these provisions would be immediately put into effect. Church property was declared to be nationalized and foreign priests and nuns were ordered to leave the country. All private schools were ordered to register with the Government and to cut all connections with religious organizations. A great storm of protest arose throughout the whole Roman Catholic world. In the United States, strong pressure was brought on the Government to intervene, but without avail.

On July 3, the Mexican government issued a decree setting forth in detail the manner in which the constitutional provisions were to be applied, and it was announced that all churches which did not conform would be closed after July 31. Protests poured in from Roman Catholic organizations abroad and the Pope remonstrated directly with President Calles. A lay organization of Roman Catholics in Mexico called for an economic boycott. The heads of the church, with the Pope's approval, announced that all religious services of the church throughout Mexico would be discontinued after July 31; but the Government adhered to its policy. Several thousand churches were closed and everything connected with religion was taken out of the schools. The hearty support of labor was evinced in a parade of 50,000 in Mexico City on August 1. Church officials held several conferences with the President in August, and presented a petition to Congress for a modification of the constitution, but it was rejected in the Chamber by an almost unanimous vote. Mexico thereupon entered on a long period of dissension, with affairs hovering always close to the line of organized violence. The church constantly accused the President of Bolshevik motives and the Government continually charged the churchmen with inciting rebel-

lion. Armed clashes occurred here and there, the most serious in 1926 being the uprising of the Yaqui Indians in September, which was long-drawn-out but did not reach alarming proportions.

Toward the close of 1926, yet another controversy stirred for a while the troubled waters of Mexican political life. In Nicaragua, Mexico recognized the Liberal Sacasa as President, while the United States recognized Diaz. In January, 1927, President Coolidge in a message to Congress charged Mexico with aiding the Sacasa cause with military supplies and aiming at the control of the Nicaraguan government to the detriment of American interest. This, President Calles promptly denied. For a while, the irritation of the United States over this matter, coming as it did when the situation was particularly strained from other causes, threatened an armed conflict; but the Nicaraguan situation gradually adjusted itself and the crisis passed.

The state of suppressed warfare between church and state in Mexico continued throughout 1927. On April 19, a bloody massacre occurred at Limon, when a band of rebels stopped a passenger train, murdered nearly all the 52 soldiers of its escort, and fired the train, killing and wounding a large number of passengers. The Government laid the outrage as well as many less serious outbreaks at the door of the Catholic Episcopate, which vigorously denied any connection with plots of violence. Six church dignitaries were deported following the Limon affair, and many others later. By some it was believed that the long series of kidnappings, murders, and other crimes were inspired by powerful interests working to embroil Mexico with the United States and bring intervention. Some color was lent to this theory in March and April, when it was disclosed that a large number of military documents had apparently been stolen from United States archives, skillfully altered to include threats against Mexico, and placed in the hands of the Mexican government. This plot linked itself with the publication in certain American papers toward the close of the year of a number of alleged official Mexican documents purporting to show actions by Mexico in Nicaragua, etc., unfriendly to the United States. A Congressional investigation in the United States left practically no doubt that they were forgeries. Continued disorders in Mexico culminated finally in a short-lived but threatening revolt in October arising out of the political situation. By an amendment to the constitution adopted in December, 1926, providing that a man might be elected to more than one term as President if the terms were not successive, the way had been paved for the return of General Obregon to power. Opposing him were Generals Francisco Serrano and Arnulfo Gomez. All three represented much the same political ideas; but the two latter, regarding their chances as hopeless in view of the attitude of the Government, joined hands in precipitating revolution. It was soon suppressed and both leaders were executed, as well as a large number of their followers.

In the late months of 1927, relations with the United States underwent a surprising and gratifying transformation. Ambassador Sheffield, who favored a much more assertive policy toward Mexico than the Coolidge administration had adopted, resigned in June. He was succeeded in October by Dwight W. Morrow, who quickly endeared himself to the Mexican people and gov-

ernment by his fair and sympathetic attitude. A non-stop flight by Lindbergh from Washington to Mexico City also had its influence in creating a more cordial feeling for Americans. With the removal of the chief cause of the differences when the oil law was repealed, the feeling between the two countries presently came to be marked by an almost cordial good will.

Although the resistance of the Roman Catholic Church continued and arrests for fomenting disturbances were numerous, that difficulty also seemed to be approaching a settlement through compromise early in 1928. In July, however, the country was thrown into a fresh ferment by the assassination on July 17 of General Obregon, who had been elected President without opposition on July 1. The assassin was a young student named José de Toral. For the moment, it seemed that the crime would precipitate civil war. Obregon's party, the Agrarians, charged the Labor Party, led by Luis Morones, with responsibility for the murder and Morones was forced to resign from the cabinet and go into hiding. President Calles, however, acted quickly to avert a clash. He placed an Obregon leader in the position of Chief of Police of Mexico City, and three days after the murder, publicly accused the Catholics of having instigated it. The crisis was thus passed without an armed clash between the two factions. Toral's confession showed a fanatical religious motive and he insisted that he was alone in perpetrating the crime. His trial was delayed until November 2. He was condemned to death and was executed on Feb. 10, 1929. A nun, Mother Superior Maria Concepcion, was tried with him as the "intellectual author" of the crime and was sentenced to 20 years imprisonment. A remarkable demonstration on the day of Toral's funeral showed that the fires of religious revolt still burned hotly.

On September 25, the Mexican Congress selected a civilian, Emilio Portes Gil, as provisional President to serve from Dec. 1, 1928, to Feb. 5, 1930. He had been Governor of the State of Tamaulipas and when elected was Minister of the Interior. President Calles, declaring that he would never again be a candidate for public office, retired to private life at the end of his term; but he was not long to remain in retirement. On Mar. 3, 1929, the most formidable revolutionary movement since the Huerta revolution of 1924 broke out. It was headed by General Jesus Maria Aguirre, military commander of Vera Cruz, and other military and political leaders. The movement was soon shown to be merely a drive for power by ambitious military chieftains, and was not inspired or particularly supported by Catholic organizations. President Gil immediately appointed General Calles Secretary of War and he at once took charge of the campaign. At the outset, the revolt enjoyed some successes, notably the capture of the port of Vera Cruz; but its fate was practically decided when the newly inaugurated Hoover administration in the United States promptly threw its support to the Mexican government and war supplies came pouring in from the north. Vera Cruz was recaptured on March 11 and the Federal forces turned to the northwest, where in western Coahuila and southeastern Chihuahua, they continued their successes. Rebel forces concentrated at Torreon, but General Escobar, their leader, was forced to evacuate the city on March 18 on the approach of Calles' army. A decisive en-

gagement occurred near Jiminez on April 1 and 2 and resulted in a complete rout for the revolutionists. By the first of May, the rebellion had completely collapsed, and General Calles returned in triumph to Mexico City on May 12.

On June 21, 1929, the Government announced the settlement of the long controversy with the Roman Catholic Church. The agreement was the result of a number of conferences between President Gil and the Roman Catholic prelates, headed by Archbishop Ruiz, the papal delegate, and Bishop Pascual Diaz. Ambassador Morrow also was credited with effective influence in the settlement. The agreement left the church properties in the hands of the Government, provided for religious instruction only within the churches themselves, and permitted the church to designate the priests who should register in accordance with Mexican law, thus acknowledging, it was claimed, the corporate rights of the church. The settlement was hailed with delight throughout Mexico, and services were soon resumed after the long three-year suspension.

In the summer of 1929, President Gil took action to secure the adoption of an advanced labor code. He requested the assent of state legislatures to a change in the constitution to permit the Federal Congress to pass such a code, and on July 26, Congress met in extra session at his call. The code requires every able-bodied citizen to learn a trade or profession, provides for obligatory employee insurance; establishes an eight-hour day and a six-day week; recognizes the right to strike, without violence; sets up labor courts; provides for a minimum wage, etc. The proposed laws met with vigorous opposition on the part of organized commercial and business interests.

MEXICO, CULTURE OF. See ETHNOGRAPHY.

MEYER, mi'ér, ADOLF (1866-). A Swiss neurologist, born near Zurich. He studied at many universities in Europe and in 1892 came to the United States, where he was on the staff of the University of Chicago and of several hospitals. From 1902 to 1910, he was director of the Pathological Institute for the New York State Hospitals and after 1910 professor of psychiatry and director of the Henry Phipps Psychiatric Clinic at Johns Hopkins Hospital. He is a member of many medical and scientific societies and wrote much on neurology, pathology, and psychiatry.

MEYER, EDUARD (1855-). A German historian (see VOL. XV). He was a professor in the University of Berlin from 1902 to 1927. Among his later works are *Die Aufgaben der Höheren Schule und die Gestaltung des Geschichtsunterrichts* (1918); *Cæsars Monarchie und das Prinzipat des Pompeius* (1919); *Perusien und Athen* (1919); *Ursprung und Anfang des Christentums* (1920-22); *Die Entwicklung des Judentums und Jesus von Nazareth* (1921).

MEYER, HERMAN HENRY BERNARD (1864-). An American bibliographer, born in New York City. He studied at Columbia University and at Pratt Institute Library School and was for several years engaged in the profession of engineering. After 1905 he was on the staff of the Library of Congress (as chief bibliographer, 1908-23, and as director of legislative reference service since 1921). He has collected a private library of over 10,000 volumes on fine printing in America, first editions, etc. He compiled many bibliographies, including *Inland Waterways of Europe* (1910); *Employer's Liability*

and Workman's Compensation (1911); *Capital Punishment* (1912); *Europe and International Policies* (1914); *Divorce* (1915); *Monroe Doctrine* (1919); *Scientific Management* (1920); *Treaty-Making Power* (1920); and *Income Tax* (1921); and published *A Brief Guide to the Literature of Shakespeare* (1915).

MEYERHOF, OTTO (1884-). A German physiologist, born in Hanover. He was educated at the Wilhelm Gymnasium, Berlin, and received the degree of M.D. from Heidelberg University in 1909. He taught physiology in various positions in the University of Kiel, until 1924, and in 1923 was awarded the Nobel Prize in medicine jointly with A. V. Hill (q.v.) for his work in the physiology of muscle. He became director of the Kaiser Wilhelm Institute of Physiology of the University of Heidelberg in 1929. He is credited with no major work, but since 1909 he has made many contributions on physiological subjects to periodical literature.

MIAMI CONSERVANCY FLOOD PROTECTION. See FLOODS AND FLOOD PROTECTION.

MIAMI UNIVERSITY. A coeducational institution at Oxford, Ohio, founded in 1809. The student enrollment increased from 651 in 1914-15 to 1783 in 1927-28 (exclusive of summer session); and the enrollment in the summer session of 1928 was 717; the faculty membership in the autumn of 1928 was 130, as compared with 51 in 1914-15; and the number of volumes in the library had increased from 47,000 to 96,000. The value of 250 acres of campus, 25 buildings and equipment, was \$3,304,000, and the income from the State of Ohio for maintenance, from gifts, fees, and income on investments for 1927-28 was \$709,115. Oxford College for women, an institution founded in 1830, was merged with Miami in 1928; a school of business administration was opened in the autumn of 1928; Ogden Hall, for men, was completed at a cost of \$350,000 in 1925 and in the same year, East Wing, of McGuffey Hall, Industrial Education Building, and an observatory with full equipment, were erected; a girls field house was erected in 1926; Oxford Retreat was converted into a men's dormitory in 1927; and Irvin Hall, a recitation building, and steel stands on the athletic fields, were added to the plant in 1928. Alfred Horatio Upham, A.M., Ph.D., a Miami alumnus and since 1921 president of the University of Idaho, was inaugurated as president of the university in October, 1928.

MIASKÓWSKY, NIKOLAI JAKOVLEVITCH (1881-). A Russian composer, born in Novogeorgievsk. He began his musical education under Glière and Kryzhanovsky, and then attended the St. Petersburg Conservatory (1906-11), where his teachers were Liudov and Rimsky-Korsakov. In 1914-20 he served in the Russian Army. In 1921 he settled in Moscow as professor of composition at the Conservatory there. In Russia, he is regarded as the most important living composer next to Glazunov. He wrote eight symphonies (C m., C# m., A m., E m., D, Eb, B m., A); two symphonic poems, *Nevermore* (after Poe) and *Alastor* (after Shelley); *Sinfonietta*, in A, an overture; two string quartets; four piano sonatas, and a cello sonata.

MICHAEL I, (1921-). King of Rumania, ruling during his minority through a Council of Regency composed of his uncle, Prince Nicholas; George Buzdugan, former president of the High Court of Cassation; and M. Cristea,

Patriarch of Rumania. He was born at the chateau of Pelischor, Sinaia, the son of Prince Carol and Princess Helen, and succeeded to the throne upon the death of his grandfather, King Ferdinand I, July 20, 1927. Prince Carol had previously renounced his right to the throne.

MICHAELIS, mi-kä-ä'lis, SOPHUS (1865-) A Danish author (see Vol. XV). His later publications include: *Hellener og Barbaren*, a novel of the Persian wars (1914); *Digte*, poems (1919); *Dommeren og Himmelskibet*, two novels (1921); *Manden fra Elba*, a play (1921); *Romersk foraar og andre digte*, poems (1921); *Solblomster*, poems (1926); *Abasard og Héloise*, a play (1926); and *Portugisiske og brasilianske Sonetter* with Ferreira d'Almeida (1927). From 1925 to 1927, he was joint editor of *Danmarks Nationallitteratur*.

MICHAELSON, ALBERT ABRAHAM (1852-). An American physicist (see Vol. XV). He was made a foreign associate of the French Academy in 1920, served as president of the National Academy of Sciences in 1923, and in 1925 became "distinguished service" professor at the University of Chicago. He has continued his researches on the velocity of light at the Mount Wilson Observatory of the Carnegie Institution of Washington. See PHYSICS.

MICHIGAN. The twenty-second State in size (57,980 square miles) and the seventh in population; capital, Lansing. The population increased from 2,810,173 in 1910 to 3,608,412 in 1920, a gain of 30.5 per cent; estimated population, 1928, 4,591,000. The white population rose from 2,785,274 (1910) to 3,601,027 (1920); Negro, from 17,115 to 66,082; native white, from 2,189,723 to 2,874,992; and foreign-born white, from 595,524 to 726,635. The urban population of the State increased from 1,327,044 to 2,241,560; the rural decreased from 1,483,129 to 1,426,852. The growth of the principal cities was as follows: Detroit (q.v.), 1910, 465,766; 1920, 983,678; Grand Rapids (q.v.), 112,571 to 137,634; Flint (q.v.), 38,550 to 91,599; Saginaw, 50,510 to 61,903; Lansing, 31,229 to 57,327. The phenomenal growth of Detroit was due to its extraordinary industrial development, chiefly in the manufacture of automobiles and their accessories.

Agriculture. Michigan is one of the most important agricultural States. Conditions have reflected the fluctuations of production and value during the period following the War. The general situation is discussed in the article AGRICULTURE and in separate articles on the chief agricultural products. The number of farms decreased from 206,960 in 1910 to 196,447 in 1920 and to 192,327 in 1925. The area of land in farms, after a slight increase in 1920, decreased by 53 per cent or to 18,035,290 in 1925. The improved land in farms totaled 12,925,521 acres in 1920. Crop land acreage (1925) was 9,671,381. The total value of farm property rose from \$1,088,858,379 in 1910, to \$1,763,334,778 in 1920 and declined to \$1,523,976,902 in 1925. The average value per farm was \$5261 in 1910, \$8976 in 1920, and \$7924 in 1925. The prices of farm land increased materially while stimulated by war prices for farm products. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. The percentage of land used for agricultural purposes in 1910 was 51.5; in 1920, 51.7; in 1925, 49.0. Of the total number of farms in 1925, 161,974 were operated by own-

ers; 1234, by managers; and 29,119, by tenants. The corresponding figures for 1910 are 172,310; 1961; and 32,689. White farmers in 1920 numbered 195,714, compared with 206,014 in 1910; colored, 733, compared with 946. Farms reported as under mortgage, 78,758 in 1920, diminished to 70,853 in 1925. The total number of cattle in 1920 was 1,586,042; in 1925, 1,406,467. Dairy cows numbered 1,256,141 in 1920; 806,201 in 1925; sheep, 1,209,191 in 1920 and 1,066,217 in 1925; swine, 1,106,066 in 1920 and 855,368 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 51,135,000 bushels; wheat, 14,202,000; oats, 58,461,000; rye, 2,366,000; barley, 8,100,000; potatoes, 35,802,000; hay, 4,327,000 tons; and sugar beets, 428,000 short tons. Comparative figures for 1913 are corn, 56,112,000 bushels; wheat, 12,776,000; oats, 45,000,000; rye, 5,362,000; barley, 2,108,000; potatoes, 33,600,000; and hay, 2,520,000 tons.

Mining. Michigan is an important producer of two minerals, iron ore and copper, the relative production of which, in the period starting with 1914 is indicated by the following figures: For iron ore, the production in 1914 was 10,796,200 long tons; 1916, 18,071,016; 1918, 16,899,341; 1919, 15,438,930; 1920, 17,510,742; 1921, 7,283,492; 1922, 12,457,856; 1926, 16,699,984. Of copper, there was produced in 1914, 164,344,058 pounds; in 1915, 265,283,378; 1916, 273,692,525; 1917, 255,710,128; 1918, 226,794,139; 1920, 154,695,073; 1921, 86,370,028; 1922, 121,712,365; 1926, 175,381,565. The decrease in output of both iron and copper ores in the period around 1920 was due chiefly to the general business depression whose results were shown in diminished use of iron and copper. There are also produced manganese ore, salt, sand and gravel, and stone. In the production of salt, Michigan was first among the States in 1926. Production of cement in 1926 totaled \$19,499,788. The coal production in 1928 was 617,342 tons valued at \$2,631,000. The total value of the mineral products of the State in 1926 was \$130,860,609, compared with \$166,338,818 in 1920; \$122,973,774 in 1919; \$158,312,121 in 1918; and \$57,743,555 in 1914.

Manufactures. Michigan is one of the most important manufacturing States. It ranks first in the automobile industry, which has acquired great importance in Detroit and other cities. In 1920 there were 28 cities of more than 10,000 inhabitants, forming 51.6 per cent of the total population of the State; and in 1919 these reported 81.8 per cent of the total value of the State's products. In 1909 there were 9159 manufacturing establishments in the State; 8305 in 1919; 5598 in 1925; and 5800 in 1927. Wage earners in manufactories numbered 471,242 in 1919; 508,573 in 1925; and 488,856 in 1927. Capital invested amounted to \$583,946,965 in 1909 and \$2,340,954,312 in 1919. The value of the products in 1909 amounted to \$685,109,169; in 1919, \$3,466,188,483; in 1925, \$4,372,996,324; and in 1927, \$4,244,941,132. The extraordinary increase in the value of the products about 1919 was due largely to the change in industrial conditions brought about by the War, and cannot properly be used to measure the normal growth of manufactures. Increase in the number of persons engaged in manufactories, however, clearly indicates a decided growth in the manufactures of the State. The most important industry in point of value of product is the

manufacture of automobiles, the output of which in 1909 was valued at \$96,651,000; in 1914, \$398,289,000; and in 1919, \$1,620,383,000; in 1925, \$1,520,296,128 not counting bodies and parts to a total of \$921,901,337. Foundry and machine-shop products were valued in 1909 at \$45,399,000; in 1919, \$324,354,000. The manufacture of steam, gas, and water engines, which developed chiefly after 1914, attained in 1919 a value of \$101,989,440. Shipbuilding had a product valued in 1909 at \$5,034,000 and in 1919 at \$85,155,000. The chief manufacturing city of the State is Detroit, having 2066 manufacturing establishments in 1909, with product valued at 252,939,000; in 1919, 2176, with \$1,234,520,000; in 1925 its product was \$1,599,340,000. Detroit is the chief city in the country in the manufacture of automobiles and parts. Grand Rapids, the city of great furniture-manufacturing establishments, in 1909 had 524 factories whose total production was valued at \$42,231,000; in 1919, 611, with \$109,135,000; in 1925, products valued at \$145,706,000. Other important manufacturing cities are Flint, Lansing, and Saginaw.

Education. Educational progress in Michigan has been steady and marked. In relation to the other States of the Union, according to the reports of the Russell Sage Foundation, Michigan rose from nineteenth place in 1910 to tenth in 1918. Only nine States made a more rapid growth in the period 1890-1918. Legislation enacted in recent years includes laws providing for a minimum term of nine months, for one year of professional work above a four-year high-school course for teachers, and State supervision of private, parochial, and denominational schools; a consolidated school law under which 43 rural high schools had been organized at the end of 1923; a tuition law which furnished high-school advantages to the students of inaccessible communities; and State-aid measures for partially impoverished districts and for classes for various types of handicapped children. There has been conspicuous growth of the normal schools and teachers' colleges and a sweeping increase in enrollment, together with much new building, in the normal schools, the university, and the land-grant college. The school population of the State, the total number of minors of 5 to 17 years, inclusive, was 992,785 in 1925-26, and the enrollment in the public schools was 871,083, as against 595,725 in 1913. Expenditure in the public day schools in 1925-26 was, current, \$76,554,655; outlays, \$22,892,664. The percentage of illiteracy in Michigan decreased from 4.2 in 1910 to 3.9 in 1920. Among the native white population, it decreased from 1.3 to 0.8; and among the Negro, from 6.9 to 4.9. Among the foreign-born, there was an increase of from 9.6 to 10.5.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were, for maintenance and operation of governmental departments, \$52,610,366 (of which \$16,473,879 was aid to local education); for conducting public services, \$107,503; for interest on debt, \$4,310,218; for permanent improvements, \$20,993,112; total, \$78,021,199 (of which \$22,658,709 was for highways, \$6,918,611 being for maintenance and \$15,740,098 for construction). Revenues were \$77,455,784. Of this, property and special taxes formed 40.5 per cent, departmental earnings and charges for officials' services 8.7 per cent, and sales of licenses and gasoline tax proceeds 32.7 per cent. Property valuation was \$8,106,010,642; State

taxation thereon, \$29,334,245. Net State funded debt on June 30, 1927, was \$74,909,093. There were outstanding \$50,000,000 of highway bonds.

Legislation. A war loan of \$5,000,000 was authorized for carrying on recruiting service and for caring for the dependents of enlisted men. The Legislature of 1919 authorized the creation of a State police force. It also created an Industrial Relations Commission and a State public utilities commission. Statutes defining and punishing criminal syndicalism and sabotage were passed. In 1921 the Legislature approved a constitutional amendment authorizing a bond issue of \$30,000,000 for the soldiers' bonus. This amendment was ratified at an election in April of the same year. Bills were passed consolidating 33 departments, commissions, and bureaus into five departments, and a State administration board was created. A special session in this year was held to put into effect the soldiers' bonus. A second special session was held as a result of a deficiency in the State appropriations. The Legislature of 1923 passed a measure punishing bribery of public employees, enacted a measure making it unlawful to publish or to accept wagers on races, games, or uncertain events, passed a uniform flag law, made the sale of narcotics a felony; amended the child-labor laws, and gave to the State Prison Commission the management of industrial plans for prisoners. A special session of the Legislature was held in September, 1923, to rearrange the State senatorial districts and to reapportion the congressional districts as constitutionally required, but a deadlock prevented enactment. In 1923 Governor Groesbeck inaugurated a system for building State concrete roads on State account with prison labor. A State tax department under three commissioners was created in 1925, provision made for commercial forest reserves with exemption from annual property taxation. A two-cent gasoline tax was imposed in 1925, it was raised to three cents in 1927; fourth offenders were rendered liable to life imprisonment, and flogging for robbery with arms was legalized.

Political and Other Events. Henry Ford, the automobile manufacturer, was for a time, after 1914, a political figure in the State and nation. Elections were held in 1914 for governor and other State officers and for a Congressman. The Democrats reelected Woodbridge N. Ferris as governor, but the remainder of the State ticket elected was Republican. The Republicans also carried the Legislature. A "blue sky" law passed by the Legislature of 1913 was declared invalid in 1914 by the Federal Court of the eastern district of Michigan. The 1915 Legislature reenacted the law in valid form. At the presidential preference primary election in April, 1916, Henry Ford received a plurality of the Republican votes, and the State delegation voted for him on the first ballot at the national convention, but later swung to Hughes. In 1916, Albert E. Sleeper, Republican, was elected governor; Charles E. Townsend, Republican, was reelected United States Senator. In the presidential voting, Hughes received 339,097 votes; President Wilson, 286,775. At this election, a constitutional amendment providing for State-wide prohibition was adopted. In 1917 all candidates on the Republican State ticket were elected. On Dec. 22, 1917, four Germans were convicted of attempts to destroy the Wel-

land Canal and several bridges. As candidates for the Senate, Truman H. Newberry, Republican, and Henry Ford, Democrat, were nominated in 1918. Newberry was elected by a plurality of 7567. Shortly after the election, charges of having expended an excessive sum in the primaries were made against him. A protest was filed with the Senate Committee on Elections against Newberry's right to a seat, but it was not sustained. Albert E. Sleeper, Republican, was reelected governor, and the Republicans elected all the members of the Legislature except two. At the State elections in April, 1919, women for the first time exercised full suffrage rights in Michigan. A State woman-suffrage constitutional amendment was ratified at the general election in November, 1918, after rejection in 1912 and again in 1913.

A proposed amendment to the liquor law, permitting the sale of light wines and beers, was defeated at this election. In October 1919, the Federal Department of Justice began grand-jury proceedings in the western Michigan Federal court district to investigate charges of excessive expenditures by Truman H. Newberry in his election to the Senate. This body, on Nov. 29, 1919, returned indictments against 135 persons on the charge of violating the Federal laws. Those indicted included Senator Newberry, his brother, John S. Newberry, and many others prominent professionally, industrially, and politically. Senator Newberry and 15 others were found guilty. An appeal was taken to the United States Supreme Court, and the convictions were reversed on the ground that the act under which they were convicted was invalid in that it applied to elections and not to primary nominations. At the State election in April, 1919, an amendment was ratified authorizing the issue of \$50,000,000 for State highway improvements. At this election, the entire Republican State ticket was elected.

At the general election in 1920, by the largest majority in the history of the State, Alexander J. Groesbeck, Republican, was elected governor. The Republicans carried all 13 congressional districts and elected every member of both Houses of the Legislature. For President, Harding received 762,865 votes; Cox, 233,460. A proposed amendment to abolish parochial schools was defeated. Senator Townsend, who had defended Senator Newberry during the Senate investigation and the campaign, was defeated for reelection in 1922; Woodbridge N. Ferris, Democrat, was elected. He was the first Democrat sent to the United States Senate for Michigan in 70 years. The Republicans, however, reelected Governor Groesbeck and the rest of the State ticket, carried 12 of the 13 congressional districts, and elected all but five of the 132 members of the Legislature.

Several months before the general election of 1922, a Supreme Court decision reversing the conviction of Senator Newberry and his political associates was handed down. About the same time, a resolution to unseat him was rejected by the Senate. However, directly following the election, Newberry resigned as Senator, and Governor Groesbeck appointed James Couzens, mayor of Detroit, to succeed him. In the State election of April, 1923, the Republicans elected their entire State ticket. Henry Ford defeated Senator Ferris in the Democratic primaries of 1924 in which he had been entered without his consent, after having given notice that he

would support President Coolidge. The State delegation to the national convention in New York therefore disregarded the plurality for him in the primaries and presented Senator Ferris to the convention as Michigan's choice for the presidential nomination.

The presidential vote in 1924 was: Coolidge, 874,631; Davis, 152,238; LaFollette, 122,014. Groesbeck was reelected governor, and Couzens was returned as U. S. Senator. Moves made from time to time to unionize the automobile industry of Detroit failed of result. Fred W. Green, Republican, was elected governor in 1926. On taking office in 1927, he undertook the retrenchment of State projects of public building. In 1928 the presidential vote was: Hoover, 965,396; Smith, 396,762. Green was reelected governor, and A. H. Vandenberg, Republican and Senator by appointment, was reelected.

MICHIGAN, UNIVERSITY OF. An institution for the higher education of men and women at Ann Arbor, founded in 1837. The enrollment increased from 6258 in 1913-14 to 13,593 in 1927-28, of whom approximately 35 per cent were women, while 64 per cent were inhabitants of the State of Michigan, and the remaining 36 per cent, with the exception of 280 foreign students, from all parts of the United States. The University comprises colleges of engineering and architecture, schools of medicine, business administration, a nurses' training school, and a graduate school. The teaching staff increased during the period under review from 535 to 742 members, the University libraries from 350,000 to 681,025 volumes, and the income, from the State mill tax and appropriation, from \$1,029,060 to \$4,600,000, for current expenses, and about \$4,000,000 from other sources. A large number of buildings were erected during the period, including: Two women's dormitories built in 1915, and a third completed in 1920; a natural science building in 1915; the general library and Michigan Union in 1918; a new university hospital begun in 1919, and opened in 1925. New engineering shops and laboratories, the teachers' training school building, the William L. Clements Library of American History building (the gift, with the library collection itself, of Regent Clements), and the first unit of the new physical science building were completed in 1923; an addition to the Dental College in 1922 doubled its accommodations for students; the first unit of the literary building, the first unit of the new medical building, and the first unit of a large group of new buildings for the law school were begun in 1923; the first unit of the law club and library was finished during 1924, the gift of an alumnus of the university, W. W. Cook, of New York; in 1925 the Nurses' Home, a gift of Senator James Couzens, was opened for occupation, and the medical school building in 1925-26. A building for the Thomas Henry Simpson Memorial Institute of Medical Research, the gift of Mrs. T. H. Simpson of Detroit, was in process of erection in the same year, and completed in 1926, when construction was begun on an architecture building and a stadium with a seating capacity of 70,000. In the following year, the university museum was completed and construction begun on the Michigan League Building for Women, to cost \$750,000, and to have an endowment of \$250,000. The outstanding addition to the plant in 1927-28 was a new building for intramural sports, which was practically completed at the end of the year.

From July 1, 1917, to June 30, 1925, the special appropriations from the State for new buildings, lands, and equipment, amounted to \$9,950,000; Senator Couzens's gift was for \$600,000, and an anonymous donor gave the new group of law buildings, while another anonymous donor gave \$150,000 for a research expedition to the Near East. The dental course of the university was lengthened to four years in 1918. In 1921-23 the Honorary Fellowship in Creative Art was held by Robert Frost, in 1923-24 and 1924-25 by Robert Bridges, Poet Laureate of England, while Mr. Frost returned to the permanent fellowship in literature in 1925-26. The holder of the former fellowship resides at the university and conducts frequent conferences with interested students. It was held in 1925-26 by Jesse Lynch Williams, novelist and dramatist. Marion LeRoy Burton, Ph.D., LL.D., who succeeded Harry Burns Hutchins as president in 1920, died in 1925, and Clarence Cook Little, Sc.D., LL.D., became president, resigning in 1929.

MIDDLEBURY COLLEGE. A nonsectarian institution of higher learning for men and women at Middlebury, Vt., founded in 1800. The College grew steadily in size from 1914 to 1928, with an enrollment for the earlier year of 340 students, 626 in the autumn of 1928, and 517 in the summer session. The faculty increased from 31 to 59 members, the library, from 45,000 to 60,000 volumes, and productive funds from \$600,000 to \$3,330,598 (1927-28). Income in the latter year totaled \$299,783 and gifts received, \$126,219. Gifts in the preceding year amounted to \$113,991, and those in 1923-24 totaled \$545,440. In 1915 the Mead Memorial Chapel was given to the College by John A. Mead, and new buildings in 1924 included The French Chateau, music practice house, and Porter Hospital. Exercises were held in November, 1928, commemorating the opening of the college in 1800, five days after the General Assembly of Vermont granted it a charter. During its lifetime through 1928, the College had graduated 2331 men and 949 women. Special summer schools of French, Spanish, and English are conducted at the college. Paul Dwight Moody, D.D., succeeded John Martin Thomas, D.D., LL.D., as president in 1921.

MIDDLETON, GEORGE (1880-). An American dramatist (see VOL XV). He was president of the Dramatists' Guild of the Author's League of America (1927-). Among his later plays are *Collusion* (1916); *The Road Together* (1916); *Polly with a Past* (with Guy Bolton, 1917); *The Cave Girl* (1919); *Adam and Eva* (1919); *The Light of the World* (1920); *Masks* (1920); *Cercle* (produced in Paris, 1922); *The Unknown Lady* (with Nazimova, 1923); *Accused* (with E. H. Sothorn, 1925); *Blood Money* (1927); and many one-act plays for little theatres.

MIDDLETON, ST. JOHN BRODRICK. FIRST EARL OF. See BRODRICK, WILLIAM ST. JOHN F.

MIERS, SIR HENRY (ALEXANDER) (1858-). A British mineralogist. He was born at Rio de Janeiro and trained at Eton College and Trinity College, Oxford. From 1882 to 1895, he was assistant in the British Museum, at the same time giving instruction in crystallography at the Central Technical College, South Kensington. Later, he was professor of mineralogy at Oxford (1895-1908), principal of the University of London (1908-15), and vice chancellor of the University of Manchester and professor of crys-

tallography (1915-26). From 1891 to 1900, he edited the *Mineralogical Magazine*. In 1905 he was president of the Geological Section of the British Association. He wrote *A Visit to the Yukon Gold Fields* (1901); *Report on Public Museums* (1928); and many scientific papers. He was knighted in 1912.

MIKKELSEN, mik'kel-sen, EJNAR (1880-). A Danish explorer (see VOL XV). In 1924 he led a colonizing expedition to Scoresby Sound, and in the following year was in command of an experimental fishing cruise to West Greenland. Among his publications are *Tre Aar paa Gronlands Ostkyst* (1914); *Norden for Lov og Ret*, a story (1920), translated as *Frozen Justice* (1922); *John Dale*, a novel (1921); *Notes on the Sea-we along the East Coast of Greenland* (1922); *With Greenland to Scoresby Sound* (1925); and *Nach barn des Nordpols* (1927).

MIKLAS, WILHELM (1872-). Second President of the Austrian Republic. Born at Krems and educated at the University of Vienna, he became a director of high schools in a number of Austrian cities. As one of the leaders of the Christian-Socialist Party, he was a member of the Austrian Parliament almost continuously from 1907 until his election as President of the Republic in December, 1928. From 1923 to 1928, he was president of Parliament and previously he served as Minister of Education and in other important offices. He was known as an opponent of union between Austria and Germany.

MILAN, mil'an or mi-lan'. The most important industrial centre of Italy and the second largest city in point of population. The number of inhabitants was estimated to be 941,070 in 1928. Of all the Italian cities that have been carrying out a programme of renovation under the auspices of the Fascist government, Milan has probably seen the greatest change. Blocks of old buildings have been torn down to make room for new construction. Beautiful commercial buildings, hotels, and mansions line such modern thoroughfares as the Foro Bonaparte, the Via Dante, the Corso Vittorio Emanuele, and the Piazza of St. Mark, formerly the Cathedral Square. Considerable progress also has been made in improving housing conditions in the closely packed industrial quarters of the city. This renovation has been directed by the Podestà, the head of the municipal government who, among other duties, directs the planning of any extensions of the city, as well as administering the water and transit service, and has absolute and uncontrolled management of the money of the taxpayers.

In 1927 the construction of an underground railway, the first in any Italian city, and of a canal connecting Milan with Venice by way of the Ticino and Po rivers was undertaken. Milan also is building an airport and a harbor which will be adequately equipped to handle large trade. In 1918 the Palazzo Reale, or Royal Palace, was presented to the municipality by King Victor Emmanuel. Among its sumptuous apartments, the most remarkable are the rooms decorated by Hayez and the Salone delle Cariatidi with monochrome paintings by Appiani. The Castel Sforzesco has been transformed into a museum of Roman and mediæval antiquities, and Leonardo da Vinci's *Cenacolo*, or tempera painting of "The Last Supper" in the refectory of Santa Maria delle Grazie, has been successfully restored. In 1924 the University of Milan was opened. Two other educational institutions, the

Literary Academy and the Higher Technical Institute, are of university rank.

MILHAUD, mē'yō', DARIUS (1892-). A French composer, born at Aix-en-Provence. After graduation from the Paris Conservatoire, he settled in Paris as composer and lecturer. One of the most aggressive of the futurists and one of the notorious "Les Six," he believes that the works of Beethoven and Wagner ought not to appear on any modern programme. In 1923 he visited the United States, conducting some of his works and lecturing at several universities. He wrote the operas *La Brébis égarée* (Paris, 1923); *Les Malheurs d'Orphée* (Brussels, 1926); a trilogy, *l'Orestiadé*, comprising *Agamemnon*, *Les Coéphores*, and *Les Euménides* (Paris, 1927); *Le pauvre Matelot* (Paris, 1928); and a second trilogy consisting of *l'Enlèvement d'Europa*, *La Libération de Thésée*, and *Ariadne abandonnée* (Wiesbaden, 1928); the ballets, *l'Homme et son Désire* (Paris, 1921), *Le Train bleu*, and *Salade* (both in Paris, 1924); incidental music to Lunet's *Esther de Carpentras* (Monte Carlo, 1927); three symphonies for string orchestra; two symphonic suites; *Poème* for piano and orchestra; five string quartets; and other chamber music.

MILHAUD, GASTON (1858-1918). A French philosopher (see VOL. XV). With his death in 1918, French philosophy lost a rare type of scholar, combining a vast fund of historical and scientific erudition with a creative critical mastery. He sided with the pragmatists in their attack on the stereotyped intellectualism of the schools, but was withal a rationalist who had faith in reason and in spontaneous self-imposed discipline. His *Descartes Savant* was published posthumously in 1921. It is a collection of well-documented studies revealing a side hitherto little known of the thinker often styled "the patron saint of French philosophy."

MILKY WAY. See ASTRONOMY.

MILLARD, THOMAS FRANKLIN FAIRFAX (1868-). An American war correspondent and newspaper publisher in China. He was born in Phelps County, Mo., and trained in the Missouri School of Mines and the University of Missouri. He became a newspaper reporter and editor at St. Louis (1895-97) and war correspondent for *Scribner's Magazine*, the *New York Herald*, the *World* (New York), the *London Daily Mail*, and other publications in the Greco-Turkish, Boer, and Spanish-American wars, the Boxer uprising in China, the Russo-Japanese War, and the World War. He founded and edited the *China Press* (1911-17) and *Millard's Review* at Shanghai (1917-). He served as unofficial adviser to the Chinese delegations at the Paris Peace Conference, at sessions of the League of Nations, at the Washington Conferences (in 1921); and on Pacific and Far Eastern Questions. In 1929, while he was Shanghai correspondent of the *New York Herald Tribune*, he was appointed foreign adviser to the Nationalist government of China. He is the author of *The New Far East* (1906); *America and the Far Eastern Question* (1909); *Our Eastern Question* (1916); *Democracy and the Eastern Question* (1919); *Conflict of Policies in Asia* (1924); *China—Where It Is Today and Why* (1928).

MILLAY, EDNA ST. VINCENT (MRS. EUGEN JAN BOISSEVAIN (1892-). An American author, born in Rockland, Me. She received her bachelor's degree from Vassar College in 1917 and since then has lived in New York City. She is the author of *Renascence and Other Poems* (1917); *Figs from Thistles* (1920); *Second April* (1921); *Aria da Capo* (1921); *The Lamp and the Bell* (1921); *Two Slatterns and a King* (1921); *The Harp-Weaver and Other Poems* (1923); *The King's Henchman* (opera, 1927); *The Buck in the Snow* (1928). Her work is finely conceived, and she is regarded as one of the foremost poets in America today. In 1922 she won the Pulitzer Prize for the best volume of verse.

MILLE, mël, PIERRE (1864-). A French novelist and journalist (see VOL. XV), who was correspondent for the *Temps* during the World War. He developed an entertaining and artistic novel along the lines of the old-fashioned "romance." Among his later writings are *Le Monarque* (1914 tr. 1925); *Sous leur dictée* (1917); *Trois femmes; Histoires exotiques et merveilleuses; Nuit d'amour sur la montagne* (1920); *Le bol de Chine; ou Divagations sur les beaux arts, essays* (1920); *L'Ange du bizarre* (1921); *Myrrhine: Images exotiques et françaises; Monsieur et Madame Barbe-Bleue* (1922); *La détresse des Harpagon* (1923); *L'illustré Partonreau* (1924); *Le diable au Sahara* (1925); *L'écrivain*, about contemporary writers (1925), and *Christine et lui* (1926).

MILLER, ALICE DUER (1874-). An American author, born in New York City. She graduated from Barnard College in 1899 and in the same year married Henry Wise Miller. Her stories cleverly portray certain aspects of social life. Her works include: *The Modern Obstacle* (1903); *Calderon's Prisoner* (1904); *Less Than Kin* (1909); *Blue Arch* (1910); *Are Women People?* (1915); *Come Out of the Kitchen* (1916); *Ladies Must Love* (1917); *Wings in the Night* (1918); *The Charm School* (1919); *Manslaughter* (1921); *Priceless Pearl* (1924); *Are Parents People?* (1925); *Reluctant Duchess* (1925); *The Springboard* (play, 1927).

MILLER, DAVID HUNTER (1875-). An American lawyer, born in New York City. He graduated from the New York Law School in 1910 and in the year following was admitted to the bar. He served as special assistant in the Department of State in Washington in 1917 and 1918 and was attached to the mission of Colonel House in Paris. During the peace negotiations, he acted as technical adviser to the American Commission and, with Sir Cecil Hurst of the British Foreign Office, drew up the final draft of the Covenant of the League of Nations. After a short service in the Department of State, he became counsel to the German government on the Upper Silesian question before the League of Nations in 1921. He served in the Spanish-American War and was the author of *Secret Treaties of the United States* (1910); *Reservation to Treaties* (1919); *International Relations to Labor* (1921); *The Geneva Protocol* (1925); and many monographs and articles on international and legal subjects. He was co-author of *What Really Happened at Paris* (1921); *The Polar Regions and Their Problems* (1927); *Drafting of the Covenant* (1928); and *Peace Pact of Paris* (1928).

MILLER, DAYTON CLARENCE (1866-). An American physicist, born at Strongsville,

Ohio, and educated at Baldwin University and Princeton. During 1888-89 he was professor of natural science at Baldwin University and in 1890 went to the Case School of Applied Science at Cleveland as instructor in mathematics and physics, becoming professor of physics there in 1893. Dr. Miller contributed important papers to scientific journals on the velocity of light in magnetic field, relative motion of earth and ether, efficiency of incandescent gas light, photographic registration of sound waves, quality of musical sounds, and similar subjects. Besides his many papers, he is the author of *Laboratory Physics* (1903); *Boehm on the Flute and Flute Playing* (1908); and *The Science of Musical Sounds* (1916). He was elected to the National Academy of Sciences and was president of the American Physical Society in 1925-26.

MILLER, JOHN ANTHONY (1859-). An American astronomer, born at Greensburg, Ind. He studied at Indiana, Stanford, and Chicago universities. After teaching mathematics at Indiana and Stanford universities, he became professor of mechanics and astronomy at the former in 1895. In 1906 he was called to the chair of mathematics and astronomy at Swarthmore College, of which he became vice president (1914-), and director of the Sproul Observatory (1911-). He was chief of the solar eclipse expedition sent by the University of Indiana to Spain in 1905 and of those sent by Sproul Observatory to Brandon, Colo., in 1918, to Mexico in 1923 and to Sumatra in 1926. His studies of stellar parallax, the solar corona, and measurements of double stars resulted in valuable contributions to the progress of astronomy. Dr. Miller is the author of *Trigonometry for Beginners* (1896), and *Analytic Mechanics* (1915).

MILLER, RICHARD E. (1875-). An American artist (see VOL. XV). He was elected to the National Academy in 1915 and in the same year won the medal of honor of the Panama-Pacific International Exposition. He had in the previous year been awarded the Potter Palmer Medal and the \$1000 prize of the Art Institute of Chicago and the Thomas S. Clark Prize of the National Academy of Design.

MILLERAND, mé'l'rān', ALEXANDRE (1859-). A French President and public official (see VOL. XV). He was again Minister of War (August, 1914-November, 1915), was general commissioner of the Republic for Alsace and Lorraine (1919-20), and Premier and Minister of Foreign Affairs (January-September, 1920). In the same year, he became President of the French Republic, after stipulating that he accepted only on condition that the firm foreign policy of the bloc national, which he had organized, be continued. With the success of the radicals in the election of May, 1924, he was forced to resign (June 11). He continued as leader of the bloc national in the Senate (April, 1925-January, 1927, October, 1927-). Among his later publications were *La Guerre Libératrice* (1918) and *Le Retour de l'Alsace à la France* (1923).

MILLIKAN, ROBERT ANDREWS (1868-). An American physicist, born at Morrison, Ill. He studied at Oberlin and Columbia and in Göttingen and Berlin, and in 1910 became professor of physics at the University of Chicago. In 1921 he became director of the Norman Bridge Laboratory of Physics at the California Institute of Technology at Pasadena. His original researches had much to do with the com-

position of matter. He was the first to succeed in isolating an electron. Professor Millikan's brilliant successes gained for him the Comstock Prize of the National Academy of Sciences in 1913 and the Nobel Prize in physics in 1923. During the World War, he was vice chairman of the National Research Council and afterward chairman of the science and research division of the Signal Corps, with the rank of lieutenant colonel. In addition to membership in many scientific societies at home and abroad, he is a fellow of the American Academy of Arts and Sciences, a member of the American Philosophical Society, and since 1915 a member and foreign secretary of the National Academy of Sciences. He is the author of textbooks and other volumes which include: *A Course of College Experiments in Physics* (1898); *Mechanics, Molecular Physics, and Heat* (1901); *Electricity, Sound, and Light* (1908); *The Electron* (1917); *Science and Life* (1923); *Evolution in Science and Religion* (1927).

MILLIN, SARAH GERTRUDE (MRS. PHILIP) (1889-). A British novelist, who was born in South Africa and privately educated. Most of her writings have been interpretations of South African colonial life and particularly of Negro character. Her works include *Dark River* (1920); *Jordans* (1923); *God's Stepchildren* (1924); *Mary Glenn* (1925); *South Africans* (1927); *An Artist in the Family* (1928); *The Coming of the Lord* (1928); and *The Fiddler* (1929).

MILLS, JAMES EDWARD (1876-). An American chemist, born at Winnsboro, S. C., and educated at Davidson College and at the University of North Carolina. During 1900-10 he taught at the latter university and became associate professor in 1904. After some years on the faculty of the University of South Carolina, he became professor there in 1913. In 1921 he was appointed technical director of research and development work for the Chemical Warfare Service at Edgewood Arsenal and since 1924 has been chief of the chemical division there. During the World War, he was a captain in the Engineer Corps (1917) and then passed to the Chemical Warfare Service (1918). His special researches, on which he published papers, had to do with subjects in the field of physical chemistry, such as molecular attraction, heats and vaporization of liquids, and specific heats.

MILLS, OGDEN LIVINGSTON (1884-). An American lawyer and public official, who was born at Newport, R. I., and graduated at Harvard. He was admitted to the bar in 1908 and began practice in New York City. Having been defeated as a candidate for Congress in 1912, he was sent to the State Senate of New York for two terms (1914-18). In the World War, he was commissioned captain and served with the A.E.F. in France. He represented the seventeenth New York District in Congress (1921-27), resigning his seat in 1927 to become Under Secretary of the Treasury.

MILLS COLLEGE. A college for women at Oakland, Calif., founded in 1885. The student enrollment increased from 127 in 1914 to 624 in 1927-28, in addition to which there was an enrollment in the 1928 summer session of 43; the faculty increased from 37 to 71, plus 26 assistants, in the autumn of 1928; and the library from 15,000 to 45,000 volumes. The total endowment funds of the college on June 30, 1928,

amounted to \$1,366,256, and the total income for 1927-28 to \$411,037, as compared with an endowment of \$452,280, and an income of \$71,545 in 1914. During the period 1914-1928, an ambitious building programme resulted in the erection on the campus of the following buildings: Alumnae Hall; Warren Olney Hall, a \$120,000 residence hall; Orchard House; Meadow House; the Mary Keyser Chemical Laboratories, grouped about a central court; an art building in 1925; Ethel Moore Hall in 1926; Outdoor Fireplace on Pine Top in 1927; and a music building in 1928. During the same period, the scheme of dividing courses by departments was changed to a division by schools and departments, as, school of fine arts, school of language and literature, school of social science, school of natural sciences, school of education, and school of graduate studies. President, Aurelia Henry Reinhardt, Ph.D., LL.D., Litt.D.

MILLSPAUGH, ARTHUR CHESTER (1883-). An American financial adviser, born at Augusta, Mich., and educated at Albion College, the University of Illinois, and Johns Hopkins. After teaching political science for two years and working in the drafting office of the United States State Department for three more, he became acting foreign trade adviser in 1921-22. When Persia requested that an American financial adviser be sent to Teheran, Dr. Millspaugh was appointed, and he and his staff reached the Persian capital in November, 1922. He found the Persian treasury empty and the fiscal administration a chaos, but with the help of the Persian authorities and the military, he straightened matters out. A budget was established, taxes were collected, and brigandage greatly diminished. He spent five years in Persia and in 1927 became financial adviser and general receiver for Haiti. He wrote *The American Task in Persia* (1925).

MILLSPAUGH, CHARLES FREDERICK (1854-1923). An American botanist, born at Ithaca, N. Y., and educated at Cornell University and the New York Homœopathic Medical College. For several years, he practiced medicine and from 1891 to 1893, taught botany at West Virginia University. In 1894 he was appointed curator of the department of botany of the Field Museum of Natural History; from 1897 to 1923 he was professor of medical botany at the Chicago Homœopathic Medical College. He was also lecturer on botany at the University of Chicago. Millspaugh carried on explorations in the West Indies, Brazil, and other parts of South America, and was the author of *American Medical Plants* (1887); *Flora of West Virginia* (1891), and many articles in scientific and popular journals.

MILNE, A (LAN A) (LEXANDER) (1882-). An English journalist and playwright, educated at Westminster and Trinity College, Cambridge. He began a journalistic career in London in 1903, was assistant editor of *Punch* (1906-14), and served with the Royal Warwickshire Regiment during the World War. His plays include: *Wurzcl-Plummary* (1917); *Make-Believe* (1918); *Mr. Pim Passes By* (1919); *The Romantic Age* (1920); *The Truth About Blayds* (1921); *The Dover Road* (1922); *Succes* (1923); *To Have the Honor* (1924); *Ariadne* (1925); *The Ivory Door* (1927); and *The Perfect Alibi* (1928). He published many other books, the most charming being his children's stories and poems: *When We Were Very Young*

(1924); *Winnie-the-Pooh* (1926); *Now We Are Six* (1927); and *The House at Pooh Corner* (1928).

MILNER, ALFRED. FIRST VISCOUNT (1854-1925). An English statesman and administrator (see Vol. XV). After a long retirement from politics (since 1905), he became a member of the war cabinet, without portofolio (1916-18), and in 1917 conducted a mission to Russia and made the Dominion Prime Ministers members of the Imperial War Cabinet. In the next year, he was Secretary of State for War and then Secretary of State for the Colonies (1919-21). In 1920 he was head of the Commission to Egypt and made the report on conditions there which resulted in the withdrawal of the protectorate and the establishment of the independent rule, with reservations, of that country. He published the *British Commonwealth* (Sheldonian Theatre, Oxford Lecture, 1919) and *Questions of the Hour* (1923).

MILWAUKEE. The largest city in Wisconsin. The population rose from 373,857 in 1910 to 457,147 in 1920 and to 544,200 in 1928 by estimate of the Bureau of the Census. Between 1916 and 1928, the city's total area increased from 23 to 40 square miles. On Jan. 1, 1929, the town of North Milwaukee, with a population of approximately 7000, was consolidated with Milwaukee. The adjacent towns of South Milwaukee, Cudahy, West Milwaukee, West Allis, Wauwatosa, Shorewood, Whitefish Bay, and Fox Point also have greatly expanded. The city has possessed home-rule power since the passage of the Home-rule Amendment to the State Constitution in 1924 and of the Home-rule Enabling Act by the State Legislature in 1925. The Mayor is the chief executive officer, elected every four years. Since the abolition of the offices of 12 aldermen-at-large, the Common Council has consisted of 25 representatives from each ward, elected in the month of April preceding each presidential election. The council functions to a large extent through six standing committees: finance-printing, judiciary-legislation, public utilities-health, street-alleys-sewers, buildings-grounds-bridges, and permits-rules-engrossed ordinances.

The board of public land commissioners has been active in city planning since 1914. In 1920 a zoning ordinance regulating the height, use, and area of buildings in the various districts of the city was adopted. Land was acquired for the Civic Centre adjoining the public library-museum and the auditorium. It involved the condemnation of 11 additional city blocks, the construction of a 1-mile, 180-ft. plaza extending to Lake Michigan, and the enlargement of Juneau Park at the end of the plaza where the lake drive begins. In 1927 the city received from the State commissioners of public lands a patent to submerged land 1500 feet wide along the shore of Lake Michigan, between McKinley Park and the north boundary of the lake, for park and boulevard purposes. In 1929 the extension of the first unit of the Lincoln Memorial Drive from its terminus at McKinley Park to Lake Park was completed. The garden homes housing development which was undertaken in 1920, pursuant to State law, was said to be the first of its type in the United States. Land was purchased and by 1924, 105 houses were completed and sold to citizens on the installment plan, to be owned on a cooperative basis; however, as the company was not able to raise suffi-

cient funds above the \$200,000 subscribed by the city and county to carry out the original \$550,000 plan, an amendment to the Wisconsin statutes was effected permitting the houses to be sold outright.

Municipal improvements have been developed at a rapid rate. In 1928 there were constructed 54 miles of water mains, 81 miles of sewers, 40 miles of streets, 20 miles of alleys, and 29 miles of municipal street-lighting system. Numerous new fire stations, branch police stations, and branch libraries have been opened since 1924; and two new viaducts and two bascule bridges have been constructed. The Cedar-Biddle Streets Bridge, which is the city's most modern one, provides a roadway 60 feet wide, two sidewalks 12 feet wide, and affords a navigation channel in the Milwaukee River of 120 feet. It was erected at a cost of \$750,000.

In 1929 the Public Safety Building, to house the central police station, county jail, criminal court, and other departments was completed as part of the Civic Centre at a cost of approximately \$1,500,000. The new \$6,000,000 Milwaukee County Court House was also under construction. The designs for both these buildings were chosen after an architectural competition. Cedar and Biddle streets have been widened to 130 feet, forming a through downtown artery that will eventually connect the Civic Centre with the lake front. Other streets in the business district have been widened to provide two additional traffic lanes by setting back the curbs. The city's park area was increased from 1021 acres in 1924 to 1230 acres in 1929. Among the outstanding gifts was a 60-acre park at Fox Point, donated by Dr. Joseph Schneider. Other properties were acquired as additions to Lincoln, Washington, Garfield, and Pulaski parks. By 1929, 44 playgrounds had been acquired.

The greater-harbor project, involving the construction of an outer harbor in Milwaukee Bay, the development of an extensive system of docks and warehouses, and the unification of railway terminals, have been carried forward by the harbor commission. Land on Jones Island was reclaimed for the outer harbor by dredging the waterway and filling behind new bulkheads. A new south breakwater, approximately 9900 feet long, was constructed by the Federal government. In 1929 the slip and open dock for the municipal car-ferry terminal was completed. In 1921 the city completed a municipal street-lighting system of gas-filled incandescent tungsten lamps, and a new intake and \$1,000,000 pumping station were constructed. A \$13,000,000 modern sewage-disposal plant on Jones Island, operated on the activated-sludge system of disposal and capable of handling 85,000,000 gallons of sewage a day, was completed in 1927. In 1928 the plant produced 100 tons of milorganite fertilizer a day, selling at \$600,000 annually; the gross operating cost for that year was \$950,000. In 1927 the city also completed a storm-relief sewer, 6.82 miles long, at a total cost of \$2,002,417. An emergency landing field for aircraft was established by the harbor commission on the north harbor tract at the entrance to the inner harbor. It was named "Maitland Airport" in honor of Lieut. L. J. Maitland, a native of Milwaukee, who made the flight from Oakland, Calif., to Hawaii in June, 1927.

In 1927, 80,163 children attended Milwaukee's 97 schools, of which there were 80 elementary schools, 7 senior high schools, 3 junior high

schools, 4 pre-vocational schools, 1 school for deaf children, and 2 technical institutions. School expenditures for 1927 were \$6,076,305 for general school purposes, \$380,300 for extension, \$326,893 for trade schools, \$727,543 for school repairs, and \$1,862,464 for school construction. The part-time vocational school, completed in 1923 under an independent tax levy and governed by an independent board selected by employers and employees, has been praised as a model school by educators in the United States and Europe. In 1927 there were 19,597 students in the day classes and 11,815 in the evening classes. The public library, in extending its service, was the first to supply a trained worker in adult education to reach the various extension classes, clubs, trade unions, and other organizations. The Art Institute first received municipal support in 1918, which culminated in 1922 in an agreement whereby the city was to acquire full ownership in 1932. In 1923 a civic symphony orchestra was started, giving bi-weekly concerts in the auditorium. In 1928, 136,429 persons were employed by 1429 industrial establishments in Milwaukee and received \$218,141,948 in wages; the value of products manufactured was \$857,139,774.

Milwaukee has attained its excellent financial standing and credit as the result of a scientific budget system, the elimination of all bonds for operating expenses, the changing of all departments to a cash basis, and the economies made possible by a centralized purchasing department paying cash for all work, including contracting. The budget adopted for the operation of city activities during 1928 totaled \$34,344,737. The public debt amortization fund, which has been in operation since 1923, had total assets of \$1,706,335 at the end of 1927. As a companion measure to this amortization fund, the first Civic Foundation of Milwaukee was organized to constitute a trust fund for gifts received from public-spirited citizens. For the first 25 years, the city treasurer was to receive annually half of the net income of the fund and thereafter seven-eighths of the net income each year. The estimated cost of new buildings for which permits were issued in 1927 was \$46,711,971. The assessed valuation of property in 1927 was \$963,143,000; the net debt was \$50,819,000. Bank clearings in 1928 were \$2,158,203,000.

MILWAUKEE-DOWNER COLLEGE. A college for women at Milwaukee, Wis., resulting from the union in 1895 of Milwaukee College, chartered in 1851, and Downer College, chartered in 1855 and located at Fox Lake, Wis. The number of students increased from 278 in the regular courses in 1914-15 to 400, to which number the enrollment is limited, in the autumn of 1928, and the enrollment in extension courses during the same period increased from 67 to 77. The faculty members numbered 37 in 1914-15 and 46 in the autumn of 1928. The library was increased from 10,875 volumes to 25,000, and the endowment rose from \$216,207 to \$1,276,302, while the income in 1927-28 amounted to \$286,552. Gifts received and pledged during 1927-28 amounted to approximately \$250,000. The two-year occupational therapy course, first offered during the World War, was later lengthened to a three-year course and a four-year course, a degree and a diploma being given in the latter; and courses in public-school music, library economy, Spanish, and additional courses in comparative literature were added to the curriculum. A \$50,000 gift from the Carnegie Cor-

poration, as an additional endowment for the art department, made possible an increase in the work offered in the history and appreciation of art; and a member of the art department faculty was awarded a scholarship by the American Institute of Architects to study art in Harvard University during the summer of 1928. Ellen C. Sabin Science Hall, valued at \$290,000, exclusive of equipment, was erected in 1927-28 to house the departments of botany, chemistry, home economics, physics, psychology, and zoology. President, Lucia Russell Briggs, A.M., LL.D.

MILYUKOV, ml'yoo-kôf', PAVEL NIKOLAEVITCH (1859-). A Russian exile and historian (see Vol. XV), who was Foreign Minister (March to May) in the first coalition government of the 1917 revolution, under Premier Lvov. He opposed the policies of Kerensky and the Bolsheviks, fled from Russia, and finally settled in Paris, where he published after 1920 the republican-democratic newspaper, *Last News*. His later works include *The Russian Intellectual Movement* (1918); *Russia's Call to Humanity, "Save our Souls"* (1919); *Bolshevism, an International Danger* (1920); *Russia and England* (1920); *Russia To-day and To-morrow* (1922); and *The Breakdown of Russia* (2 vols., 1925-26).

MINE, SUBMARINE. In the World War, the submarine mine played a most important part. The numbers used and the areas planted were so enormously greater than in any previous war—indeed, than in all previous wars combined—as to make such former use seem trivial. The various types of mines were much improved during the War and the methods of planting and sweeping were revolutionized. Both the British and Germans were much impressed by the use of mines in the Russo-Japanese War and were prepared at the outbreak of hostilities to use them in great numbers. At this time, due to war experience, the Russian mine was probably the best, but, as the Germans picked up Russian mines early in the War, they were able to improve their own. British, French, Italian, and American mines were improved by experience and from inspection of captured German mines, but it was not until September, 1917, that the improved British mine began to be turned out in adequate quantities. The improved American mine began to be manufactured in enormous numbers in the latter part of 1917. Some new types of mines were developed during the War, such as the depth bomb (see BOMB, DEPTH) and the British net mine. The Leon drifting mine, which was brought out just before the War, was used with great effect in the Dardanelles where the conditions exactly suited it.

The plans of the German mines were derived from a careful examination of captured ones. The mooring rope reel was secured to the mine-case and not to the anchor. Anchor and mine were held together by a device locked with a sal-ammoniac plug. When dropped, mine and anchor sank slowly to the bottom where they remained until the dissolving of the sal-ammoniac plug permitted glycerine to escape from beneath a plunger in a dashpot. The mine was then released and rose until, at the required depth below the surface, the reduction of pressure allowed a clamp to securely grip the anchor rope. The main firing circuit was closed by the tension on the mooring rope as soon as the mine started upward, but the battery was

still inoperative. Several contact horns protruded from the case, each horn consisting of a small lead cylinder enclosing a glass tube that contained the electrolytic fluid. Directly below each horn and inside the case there was a brass cylinder that had in its upper part the terminal plates of a battery the wires from which passed through a wooden plug into the detonating fuse, though each zinc wire was brought to the filling hole where the circuit was kept broken while the mine was being handled. Over each lead contact horn was screwed a brass safety cylinder that was removed before the mine was dropped. When one of the contact horns was struck by a passing vessel, the lead cylinder was bent and the glass container inside it broken. The electrolyte then poured into the brass cylinder beneath and completed the formation of a battery that produced a current and exploded the mine. Though their efficiency was admitted, neither the German nor the Russian mine was copied in England, as their cost (about \$1000) was deemed excessive.

The Leon floating mine was invented by a Swedish officer. It is cylindrical in shape and may be dropped in the usual way or expelled from a torpedo tube. The weights are so adjusted that it floats with its axis vertical. The upper half contains the explosive and firing mechanism and the lower half is divided into a water reservoir, that fills where the mine is dropped, and the compartment for the depth mechanism. The latter consists of a battery and motor, driving a propeller on a vertical shaft, and a hydrostat which starts the propeller to lift the mine when it sinks beyond the designed depth and stops it when it reaches the upper limit. With the chamber filled, the mine is only slightly heavier than water and is easily kept from 5 to 15 feet below the surface.

At the outbreak of war, the Germans promptly laid mine fields along their own coast and began laying small areas or lines off the British coast. The first British mine field was laid early in October north of Ostend and designed to check the passage of German submarines through the Channel. Others were placed off British harbors. During 1915, 15 small mine fields were laid near the Belgian coast and others in German waters. In that year, the Germans first began to use submarine mine layers and in 1916 the British also used them. In the latter part of 1916, the British laid the Belgian coast barrage, 12 miles off the Belgian coast and 40 miles long, supplemented by mine nets about a mile from the mines.

Early in 1917, a deep net barrage was laid across the Straits from the Goodwins to Snouwh Bank, supplemented with deep-set mines. The nets dragged and the field had to be swept and relaid. During the year 1917, 15,686 mines were laid by the *Abdiel* (ex-destroyer) and five mine-laying submarines; but it was not until September, 1917, that an efficient mine began to be turned out in adequate quantities to warrant undertaking any of the extensive projects that had been under consideration.

The greatest of these was the closing of the entrances to the North Sea—the Channel at Dover and the northern passage from the Orkneys to Norway, the latter requiring a mine field 250 miles long. The mines were dropped at 300-foot intervals and there were 10 rows at a depth of 65 to 80 feet, 4 at about 160 feet, and 4 at about 240 feet. The work was begun

in March, 1918. In May, the American Mine Squadron No. 1, consisting of nine large mine layers having a total capacity of 5530 mines, arrived at Invergorden, Scotland. The work was completed in the next five months. The British laid 13,546 of their own mines; the American squadron laid 56,571 American mines and 890 British; total, 70,117. The Dover barrage contained 9500 mines.

The wide use of the mine exerted great effect upon naval strategy and operations. It closed the Baltic against the British fleet and effectively isolated Russia. Its threat of danger curbed the activities of U-boats by compelling them to proceed to their destinations by difficult channels over vastly longer distances; and, of about 200 boats lost, 43 are known to have been destroyed by mines. Probably 7 or 8 of those whose fate is unknown were sunk in mine fields, while many others were so badly injured as to force a return to base. The British losses from mines were: 5 battleships (13 lost from all causes), 1 cruiser (13 lost), 2 light cruisers (12), 5 sloops (18), 20 destroyers (64), 4 submarines (54).

Extensive mining operations were carried out in the Mediterranean and elsewhere, but compared to the great North Sea work, they were relatively small. The vast number of mines laid across harbor entrances and other routes of commerce and of war vessels made the operation of mine sweeping as important as mine laying. The entrances to many ports were swept daily and the channels leading to others were constantly patrolled and swept if mines were reported in them or in their vicinity. On Nov. 11, 1918, the total number of mine sweepers in the British service alone was 726, and large but lesser numbers were in use by the other Allies (including the United States).

Such improvements in mines and in mining operations as have been developed since the War are carefully guarded secrets of the countries in which the improvement has occurred. Developments in mining vessels—mine layers and mine sweepers, especially the former—are in progress in all the leading navies and complete secrecy in regard to them is not possible. France is building a large mine-laying cruiser of 5600 tons; Great Britain completed one of 6740 tons in 1927; and the United States completed the large submarine mine layer, V-4 (surface displacement, 2890 tons), in 1928. France, Italy, and Japan have built and are building submarine mine layers. See *VESSELS*, *NAVAL*, *Mine Layers* and *Mine Sweepers*; under *Naval Operations*, *WORLD WAR*; *BOMB DEPTH*; *PARAVANE*; *BOMBING OF VESSELS*, etc.

MINE HOISTS. See *ELECTRIC MOTORS IN INDUSTRY*.

MINE LAYER, MINE SWEEPER. See *VESSEL*, *NAVAL*; *MINE*, *SUBMARINE*; *NAVIES*.

MINERALOGY. Developments in this science since 1914 have included the discovery and description of a number of new mineral species, experiments in the artificial production of minerals, and the study of mineral properties, chemical and physical, with the use of more refined or elaborate methods than were previously available.

New Minerals. The possibilities of the occurrence of undiscovered species are still far from exhausted, apparently, for many new compounds or specific variations of known types are brought to notice each year. The listing

of the new names is hardly warranted in this place, as all of them are of minor importance in both distribution and economic value, and many are simply varieties of known forms distinguished by some special property. The considerable number of new species which have been added to the sum of our knowledge in mineralogy have for the most part comprised rare substances of which but relatively minute quantities have been discovered. The notable exception to this rule is furnished by the new sodium borate, *kernite*, which was discovered in 1926 and was found to exist in such quantities as to constitute an important source of commercial borax.

Experiment and Research. For investigations of the fundamental characteristics of minerals, the work of the Carnegie Geophysical Laboratory was of signal importance. Its endowment of technical equipment and the skill of its staff put the institution on a unique basis in this branch of research. One of the tasks it undertook was the investigation of the rock-forming silicates, in which much interest centres on account of their bearing on the formation and conditions of stability of the ingredients of igneous rocks. Rankin, in a study of the system, lime-alumina-silica, reproduced such minerals as quartz, tridymite, cristobalite, corundum, wollastonite, sillimanite, and anorthite, besides many calcium silicates not known to occur in nature but present in certain artificial products. The results throw light also on the compounds formed in the hardening of Portland cement. Andersen experimented with the system, anorthite-forsterite-silica, and explained some of the features of the basic igneous rocks. Johnston, Merwin, and Williams discovered important features of calcium carbonate, particularly that the substances had three phases, only two of which had been known to occur in nature. For the experiments of Bowen in the crystallization of melts, see *GEOLOGY*.

Allen determined the true chemical structure of the mineral bornite, one of the important copper ores. The artificial production of diamonds continued to attract interest, and the latest trials have been made by Sir Charles A. Parsons, the English inventor, who secured transparent crystals up to seven-tenths of a millimeter in diameter. Contrary to the conclusions of Moissan, who first succeeded in making diamonds, the more recent work indicated that great pressure and heat were not the essential factors in effecting the crystallization of carbon in a molten bath: it appears that the diamond forms at a temperature around 690°C., below the freezing point of the iron matrix, through the reactions of occluded gases. The results, if not wholly successful, were very suggestive and will doubtless encourage further investigation.

A means of distinguishing artificial rubies, the manufacture of which has been brought to a high state of perfection, was given by Michel. The artificial stones have a concentric banding and lines of bubbles, arising from the process of depositing the molten aluminum oxide. The pear-shaped melt shows an optic axis diagonal to the longer diameter. No methods have been found to make synthetic emerald, topaz, peridot, or phenacite. The disperse colors of quartz, according to Watson and Beard, may be referred to the effects of small amounts of foreign substances, of which the commonest are

manganese, iron, and titanium oxides. Amethyst contains more than the average amount of manganese, which is present in colloidal form and imparts a purple color. Rose quartz is probably not attributable to an inorganic substance, for it can be bleached by heat, after which the color cannot be restored by exposure to the sun's rays. Blue quartz contains fine rutile crystals which are arranged after a definite pattern and cause dispersion.

Probably no phase of mineralogical research has developed such importance or claimed the endeavors of such an army of scientists as that which has to do with crystal structure as revealed by the X-rays. The bibliography of this field has now assumed substantial proportions, as evidenced by the exhaustive *Bibliography of Crystal Structure* published in 1927 by the University of Chicago Press. Notable contributors to the advance of knowledge regarding crystal structure have been Sir William Bragg in England, Frederick Runne in Germany, G. Aminoff in France, and Ralph W. G. Wyckoff in the United States.

The problems of chemical mineralogy have mainly involved the investigation of the chemical constitution of the silicates. In this field, A. N. Winchell has been prominent in this country with his studies of such groups as the pyroxenes, the monoclinic amphiboles, the feldspars, the zeolites, and the micas. Along the same line of investigation, W. Wahl of Germany has made some contributions. In England, the work of A. F. Hallimond on molecular volume and atomic volume relations was noteworthy. The Russian mineralogists have been active in the further expansion and interpretation of von Fedorov's system of crystallo-chemical analysis, a monumental work, but one that is at present somewhat unwieldy. In the field of physical properties, L. J. Spencer has published some extremely useful tables of specific gravity.

Bibliography. Among general works for students of mineralogy published recently are Bayley, *Descriptive Mineralogy* (1917), a new work, not a revision of an old one; Kraus and Hunt, *Mineralogy* (1920, 2d ed., 1928); Kraus and Holden, *Gems and Gem Minerals* (1925); Loomis, *Field Book of Common Rocks and Minerals* (1923); and Whitlock, *Story of the Minerals* (1925).

MINIMUM WAGE. Within the period 1912-28, mandatory minimum-wage legislation in the United States had run its full course and at the end of the period the outlook for the success of legislation of this character was dubious. The higher courts of the States had found minimum-wage legislation constitutional; but with the handing down of the Supreme Court decision in *Adkins v. Children's Hospital* (1923), in which the law of the District of Columbia was found to violate the due-process clause of the Fifth Amendment, the experiment was cut short. Since 1923 the only minimum-wage commission that has been functioning to any purpose has been that of Massachusetts, where the law is not mandatory but depends upon the enlisting of public opinion for its enforcement. Over the period 1912-28, 17 States have experimented with wage regulation for women and minors, viz., Arizona, Arkansas, California, Colorado, District of Columbia, Kansas, Massachusetts, Minnesota, Nebraska, North Dakota, Oregon, Porto Rico, South Dakota, Texas, Utah, Washington, and Wisconsin.

The first law to be passed was that of the State of Massachusetts in 1912. In the next year, the following put minimum-wage laws on their statute books. California, Colorado, Minnesota, Nebraska, Oregon, Utah, Washington, and Wisconsin. By 1923 the other eight States had followed suit. These laws have undergone many vicissitudes in the brief intervals. In Nebraska in 1919 and in Texas in 1921, the legislatures repealed the laws. In April, 1923, the District of Columbia, Arkansas, and Arizona laws were declared unconstitutional by the U. S. Supreme Court. In Porto Rico and Kansas (1925), the State supreme courts found the law unconstitutional, basing their decisions upon the U. S. Supreme Court findings. In Minnesota, the State attorney general ruled that the law, as far as application to adult women was concerned, was illegal. In Wisconsin, the law was held unconstitutional by a Federal district court. The result has been that, by the spring of 1929, many States had definitely ceased paying attention to the establishment of a minimum wage for adult women.

Under most of these laws, the position of minors was undetermined and where the law with respect to women has been held to be unconstitutional, little or no effort was being made to fix a minimum wage for children. Wisconsin has been the only State to attempt new legislation. Its old law was positive. It declared that the State's industrial commission had the right to fix wages consonant with "the necessary cost of proper living." The new law makes the negative rule that "no wage paid shall be oppressive" and by it the industrial commission has the power to issue orders setting forth what rates are oppressive and unjust.

The minimum-wage laws were of three types. In one type, statutory minimums were fixed by law. Such laws were passed in Arizona, Porto Rico, South Dakota, and Utah. The Arizona law of 1917 fixed the minimum wage at \$10; the Porto Rico law of 1919 fixed the minimum wage of workers over 18 at \$6 and the minimum wage of those under 18 at \$4; the South Dakota law of 1923 fixed the minimum wage of experienced workers at \$12. The Utah law of 1913 fixed the wage of adults at \$7.50.

Laws of the second type created commissions with the power of making investigations in particular industries and the right to hand down decrees; but these decrees could not be enforced and only the power of public opinion might be invoked. Such laws were passed in Massachusetts and Nebraska, but the commission in the latter State never functioned. Laws of the third type created commissions that might hold investigations and hand down decrees and which had the power of enforcement. These commissions were set up in the other 11 States, but in two of them, Colorado and Texas, the commissions never functioned. The following have been the experiences of the States where the commissions have handed down decrees: California, 40 decrees during 1916-23; District of Columbia, 5 decrees during 1919-22; Kansas, 7 decrees during 1918-22; Massachusetts, 35 decrees during 1914-27; Minnesota, 12 decrees during 1914-21; North Dakota, 13 decrees during 1920-22; Oregon, 31 decrees during 1913-22; Washington, 17 decrees during 1914-22; Wisconsin, 23 decrees during 1913-27.

The customary economic arguments have proved of small significance, if the experience of

a single State may be taken as typical. The Industrial Welfare Commission of California, in its report covering its activities for the years 1922-26, showed that: 1. The minimum wage does not tend to become a maximum wage. For a group of industries, the minimum wage fixed was \$16. In 1920, 46.4 per cent of 56,000 women were getting \$17 or more per week; in 1925, of 76,000 women, 63.2 per cent were getting \$17 or more. 2. Apprentices were not being dropped as they approached the minimum wage so that new apprentices might replace them at sub-minimum wages. In 1920, of 50,704 women on the pay-rolls of certain industries, 14.3 per cent were receiving less than \$16 a week as learners. In 1925, of 18,228 women, 5.8 per cent were receiving less than \$16. 3. The minimum wage did not result in replacing normal workers by sub-standard workers merely because the latter, by law, were permitted to accept less than the minimum wage. At the end of 1925, there were only 335 licensed sub-standard workers in the State. 4. Minimum-wage legislation was not injurious to the better workers. In 1919, with a \$10 minimum, only 446 were receiving \$30 weekly or more; in 1925, with a \$16 minimum, 6084 women in the same industries were receiving \$30 a week or more.

Other Countries. The first minimum-wage law to be written on the statute books of any country was the New Zealand Industrial Conciliation and Arbitration Act of 1894. The minimum-wage principle was subsequently widely adopted in Australia, Great Britain, Canada, South Africa, and, on a smaller scale, in France, Germany, Austria, Czechoslovakia, Norway, Hungary, Argentina, and Uruguay. Only in New Zealand and in certain Australian states, however, was an attempt made to grapple with the whole problem. In other countries, the laws were limited to special groups of workers. In Great Britain, e.g., legislation applied to workers in a list of enumerated trades and for these minimum rates were fixed independently by separate boards. In France, the act of 1915 was concerned only with home work. So were the Norway Act of 1918 and the German Act of 1923, though in these two countries legislation specifically declared that the minimum rate for home work was to be fixed on the basis of the prevailing factory rates.

During the post-war period, the International Labor Office sought to play a larger rôle in minimum-wage regulation. In January, 1926, the governing board of the office placed on the 1927 agenda of the Conference of the International Labor Office the following subject with the end in view of preparing a draft convention: "Minimum-wage fixing machinery in trades in which organization of employers and workers is defective, and where wages are exceptionally low, with special reference to the home-working trades." No action was taken in that year.

MINING EQUIPMENT. See **ELECTRIC MOTORS IN INDUSTRY.**

MINNEAPOLIS. The largest city of Minnesota. The population increased from 301,408 in 1910 to 380,582 in 1920 and to 455,900 in 1928 by estimate of the Bureau of the Census. A city-planning commission was created in 1919 in accordance with the proposed city plan prepared two years previously; this, in turn, was followed by a zoning law under the authority of which a zoning ordinance was adopted by the City Council. A central coordinating financial body was

created in 1919 under the title of Board of Estimate and Taxation; the Board of Charities and Corrections was reorganized into the Board of Public Welfare; and a Municipal Pension Board was created. The Board of Education, the Board of Estimate and Taxation, the Board of Park Commissioners, the Library Board, the city comptroller, and the city treasurer are responsible directly to the electorate and not to the City Council or mayor. In 1919 a proposed new street-railway franchise was rejected by referendum, and two years later the Legislature placed the street railway company, for the consideration of valuation and rates, under the Minnesota Railroad and Warehouse Commission. In 1920 the city voted to accept home rule, and the following year a citizens' charter committee proposed a new city-manager charter, which was defeated. Agitation for it, however, is still active.

On completion of the U. S. Government high dam in 1917, Minneapolis was made head of navigation on the Mississippi. The city had prepared preliminary terminal facilities. Four important bridges were built spanning the Mississippi; one of these, the Cappelen Memorial Bridge, has a single concrete arch of 400 feet. (For detailed information about the Robert Street Bridge, the Inter-city Bridge, and the Cedar Street Bridge, see **SAINT PAUL**.) An extensive building programme, developing especially the junior high schools, has placed Minneapolis fourth in rank in percentage enrolled in the high schools of the United States. In 1928 Minneapolis had 86 public elementary schools, six junior high schools, four junior-senior high schools, four senior high schools, two vocational training schools, and a special hospital school for tubercular children; the school population numbered nearly 80,000. The park system also was enlarged by the addition of 491 acres, making a total area of 3651 acres within the city limits and representing a capital investment of \$14,291,279. In 1927 a new auditorium, with a seating capacity of 12,500, was opened. Adequate airport facilities have been provided, lines operating daily between Minneapolis and Chicago, Minneapolis, Des Moines, and Kansas City, and Minneapolis and Winnipeg.

Minneapolis has become a city of diversified industries, the products of its 1200 manufacturing plants covering nearly the entire range of human requirements, with motor vehicles, linseed products, knit goods, structural iron work, bakery products, railroad-car construction and repair, and printing and publishing in the lead. In 1925, 31,730 persons were employed by these establishments and received \$40,311,000 in wages; the value of products manufactured was \$338,824,000. The flour mills of Minneapolis, however, represent the world's greatest concentration of milling capacity. From 1912 to 1919, their output was more than 17,000,000 barrels in every year but one; from 1920 to 1928, the annual flour production ran between 11,500,000 and 15,500,000 barrels; but even with this decline, the Minneapolis output exceeded the combined output of the two next largest producers. Minneapolis is the home of the Federal Reserve Bank of the ninth district. Bank clearings in 1928 amounted to \$4,419,614,000. The assessed valuation of property in 1927 was \$426,858,000; the debt was \$52,921,000.

MINNEAPOLIS SYMPHONY ORCHESTRA. See **MUSIC, Orchestra.**

MINNESOTA. The eleventh State in size (84,682 square miles) and the seventeenth in population; capital, St. Paul. The population increased from 2,075,708 in 1910 to 2,387,125 in 1920, a gain of 15 per cent; estimated population, 1928, 2,722,000. The white population rose from 2,059,227 (1910) to 2,368,936 (1920); Negro, from 7084 to 8809; native white, from 1,516,217 to 1,882,772. The foreign white population decreased from 543,010 to 486,164. Urban population rose from 850,294 to 1,051,593; rural from 1,225,414 to 1,335,532. The growth of the principal cities was as follows: Minneapolis (q.v.), 1910, 301,408; 1920, 380,582; St. Paul (q.v.), 214,744 to 234,098; Duluth (q.v.), 78,466 to 98,917.

Agriculture. As Minnesota is one of the principal grain-growing States, agricultural conditions have been strongly affected by the fluctuation in prices and production which characterized the war and post-war periods. (See articles, AGRICULTURE, CORN, WHEAT, etc.) The number of farms in the decade 1910-20 kept pace almost exactly with the increase in population; the number of farms, 178,478 in 1920, despite agricultural depression, rose to 188,231 in 1925. The acreage of land in farms, on the other hand, fell from 30,221,758 to 30,059,137, or by 0.3 per cent. The improved land in farms totaled 21,481,710 acres in 1920. Crop-land acreage (1925) was 18,651,190. The total value of farm property rose from \$1,476,411,737 in 1910 to \$3,787,420,118 in 1920, but declined to \$2,761,684,227 in 1925. The average value per farm was \$9456 in 1910, \$21,221 in 1920, and \$14,672 in 1925. Farm-land values greatly increased in the period of war prices for farm products. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. The percentage of the total land area in farms increased from 53.5 in 1910 to 58.4 in 1920, but was 58.1 in 1925. Of the total number of farms in 1925, 136,382 were operated by owners; 760, by managers; and 29,930, by tenants. The corresponding figures for 1910 were 122,104; 1222; and 32,811. White farmers in 1920 numbered 178,271, compared with 155,844 in 1910; colored farmers, 207, compared with 293. Farms reported as under mortgage in 1920 numbered 69,545; in 1925, 66,319. The total number of cattle in 1920 was 3,021,469; in 1925, 2,853,465. Dairy cows numbered 2,080,627 in 1920; 1,311,897 in 1925. Despite this drop, the State increased its lead over every other in creamery butter output. Swine numbered 2,380,862 in 1920 and 2,715,074 in 1925. The number of sheep on the farms in 1920 was 509,064; in 1925, 378,972. The estimated production of the principal farm crops in 1928 was as follows: Corn, 143,115,000 bushels; wheat, 23,955,000; oats, 153,338,000; rye, 5,950,000; barley, 60,000,000; potatoes, 38,940,000; flaxseed, 5,518,000; and hay, 6,558,000 tons. Comparative figures for 1913 are corn, 96,000,000 bushels; wheat, 68,040,000; oats, 112,644,000; rye, 5,700,000; barley, 34,800,000; potatoes, 30,250,000; and hay, 2,490,000 tons.

Mining. Minnesota is the leading State in production of iron ore. Although it also has important quantities of clay products, cement, and stone, it is iron which sets Minnesota high among mineral producing States. Minnesota was twelfth in value of mineral products in 1926. The fluctuations in output of iron ore in the period starting with 1914 are indicated by

the following figures: 1914, 21,946,901 long tons; 1916, 44,585,422; 1917, 44,595,232; 1918, 41,953,969; 1919, 36,000,626; 1921, 17,811,325; 1922, 30,209,372; 1926, 40,961,361. The diminished production in 1921 was due largely to the general business depression, which lessened demand for the products of iron ore. The value of the clay products, exclusive of pottery, fluctuated from \$1,944,886 in 1914 to \$1,503,659 in 1918; \$3,341,477 in 1920; \$2,482,286 in 1921, and \$1,852,566 in 1926. In addition to the minerals mentioned above, manganiferous ore, of which the 1925 output attained a value of \$1,761,422; mineral waters, and sand and gravel also are produced in the State. The total value of the mineral products in 1926 was \$118,361,306; in 1921, \$72,609,973; \$177,589,967 in 1920; \$155,412,823 in 1918; and \$45,080,865 in 1914.

Manufactures. Minnesota is an important industrial State. In 1920 there were 11 cities with populations over 10,000, forming 33.6 per cent of the total population. These cities, in 1919, produced 63.3 per cent of the State's manufactured products. There were in the State, in 1909, 5561 manufacturing establishments; in 1919, 6225; in 1925, 3888; in 1927, 3886. Wage earners in manufactories numbered, in 1919, 115,623; in 1925, 100,614; in 1927, 98,833. Capital invested amounted to \$275,416,029 in 1909 and \$679,386,486 in 1919. The value of the manufactured products in 1909 amounted to \$409,419,621; in 1919 to \$1,218,129,735; in 1925, to \$1,101,856,000; and in 1927, to \$1,066,727,215. The increase in value of products about 1919 was to a great extent due to changes in industrial conditions caused by the World War and cannot properly be used to indicate the growth of manufactures. But the increase in the number of establishments and in the number of persons engaged in manufactories showed clearly a considerable growth in the manufacturing activities of the State. Flour-mill and grist-mill products were chief in point of value; in 1909, \$139,136,000; in 1919, \$381,249,000; in 1925, \$215,637,578. Slaughtering and meat packing form the second industry in this respect: in 1909, \$25,754,000; in 1919, \$146,919,000; in 1925, \$182,555,429. The manufacture of butter and cheese ranks third, amounting in 1909 to \$25,287,000; in 1914 to \$33,746,000; and in 1919 to \$91,720,000. The product of the lumber and timber industry, in fourth place, was valued at \$42,353,000 in 1909; \$44,675,000 in 1914; and \$52,580,000 in 1919. The principal manufacturing cities are Minneapolis, St. Paul, and Duluth. There were in Minneapolis, in 1909, 1102 manufacturing establishments, with a product valued at \$165,405,000; in 1919, 1421 with \$491,383,000; in 1925 the product was \$338,824,000. In St. Paul in 1909, there were 719 with \$58,990,000; in 1919, 818 with \$149,638,000; in 1925 products attained \$193,013,000. Similar figures for Duluth were: in 1909, 194 with \$17,180,000; in 1914, 243 with \$19,729,000; and in 1919, 226 with \$75,261,000.

Education. Substantial progress has occurred in educational development in Minnesota. School districts have been authorized to establish special departments for the instruction of physically handicapped children, subnormals, the deaf, blind, defective of speech, and the crippled, and a special grant of \$100 to \$300 per child was allowed by the State for this work; provision was made through the State Department of Education for the rehabilitation of disabled per-

sons; a law was passed requiring physical training and health instruction in all public schools and in all institutions for the training of teachers; and a new supplementary State-aid law was enacted, guaranteeing to every school district \$40 per child on a \$.02 tax levy in addition to all other forms of State support, with the State paying the difference between what a \$.02 tax levy would produce for each pupil involved and \$40. The school enrollment increased from 457,041 in 1914 to 549,899 in 1925-26; the number of teachers, from 16,920 to 21,958. The expenditures for all public schools was: Current \$42,494,825; outlays, \$9,434,842. The permanent school fund amounted to \$49,808,470. The percentage of illiteracy in the State decreased from 4 to 2.4 in 1920; among the native whites, from 0.5 to 0.4; among the foreign-born whites, from 7.7 to 5.6; among the Negroes, from 3.9 to 3.5.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$36,700,222 (of which \$11,099,620 was aid to local education); for interest on debt, \$3,859,640; for permanent improvements, \$12,575,914; total, \$53,135,776 (of which \$15,599,746 was for highways, \$4,871,094 being for maintenance and \$10,728,652 for construction). Revenues were \$63,766,540. Of this, property and special taxes formed 24.6 per cent, departmental earnings and charges for officials' services, 7.9 per cent; and sales of licenses and a tax on gasoline, 49.5 per cent. Property valuation was \$2,365,019,180; State taxation thereon, \$10,719,860. Net State funded debt on June 30, 1927, was \$11,715,348. This total did not include road bonds issued by counties, on which the State was obliged to meet charges.

Political and Other Events. Minnesota was much affected by the agricultural situation in the years following the War. Among the farmers, the Farmer-Labor Party acquired sufficient power to elect candidates for important offices, including two United States Senators. In 1914 W. S. Hammond, Democrat, was elected governor. The Republicans elected Representatives in all districts except one. In 1916 Minnesota was one of the so-called doubtful States. Hughes received 179,553 votes for President, and Wilson, 179,157 votes. The Republicans elected J. A. A. Burnquist governor, and F. B. Kellogg was elected United States Senator. In 1918 Governor Burnquist was reelected, as was Senator Knute Nelson. The Nonpartisan League took part in the campaign and showed considerable strength. In 1919 A. C. Townley, president and organizer of the National Nonpartisan League (see NORTH DAKOTA), was convicted of disloyalty and sentenced to three months' imprisonment by the Martin County district court at Fairmount. The Republican candidate for governor, J. A. O. Preus, was elected in 1920. For President, Harding received 519,421 votes and Cox, 142,094. At this election, the people approved amendments authorizing the construction of a trunk highway system, the taxation of motor vehicles, and the assessment of all real property used for railway purposes. In 1922 the Republicans again elected Governor Preus, but the Farmer-Labor organization elected H. K. Shipstead to the Senate. At this election, the State voted to lend its credit for the assistance of farmers. On the death of Senator Nelson in

1923, a special election was held to fill the vacancy. The Farmer-Labor candidate, Magnus Johnson, was elected. Theodore Christianson, Republican, was elected governor in 1924. For President, the vote was: Coolidge, 420,759; La Follette, 339,192; Davis, 55,913. Christianson was reelected in 1926 and in 1928. In 1928 the vote for President was: Hoover, 560,977; Smith, 396,451. Senator Shipstead, despite the decline of the Farmer-Labor Party, was returned by a great majority.

Legislation. The legislature of 1917 provided for the submission to the people in 1918 of both a woman-suffrage amendment and a prohibition amendment. This Legislature enacted a "blue sky" law and made provision for the voting of citizens absent from the State in the national service. It also created a public safety commission. The prohibition amendment lacked the necessary three-fifths vote, but the 1919 Legislature ratified both the proposed prohibition and woman's-suffrage amendments. It also provided for an eight-hour day on public work, and passed statutes defining and punishing, criminal syndicalism and sabotage. The Legislature of 1921 regulated aircraft and appointed a Commissioner of Agriculture empowered to aid cooperative bodies engaged in buying and selling farm products. The office of Labor Commissioner was abolished and the Industrial Commission was created. Provision was made for the enforcement of the laws relating to intoxicating liquors. The compulsory school laws were amended; a workmen's-compensation insurance board was created; and amendments were made to the Workmen's Compensation Law. In 1923 the legislature passed a measure forbidding the wearing of masks in public places. A measure also was enacted to facilitate cooperative marketing of agricultural products. An administrative reorganization of the State under 13 departments was enacted in 1925. Sterilization of the feeble-minded was authorized. A constitutional amendment proposed in 1925 and adopted in 1926 gave authority for State measures to encourage reforestation, and a group of such measures were passed in 1927. Provision for heavier criminal penalties were also then enacted.

MINNESOTA, UNIVERSITY OF. A State institution, founded in 1868, with its main campus in Minneapolis; the Department of Agriculture, including various colleges, schools, and experiment stations, at University Farm, St. Paul, in Crookston, Morris, Grand Rapids (Minn.), Duluth, Waseca, Owatonna, Itasca and Cloquet; and the graduate medical school in Rochester, Minn. In 1913-14, the number of resident students of collegiate grade was 4155, and total registration, including extension, subcollegiate, etc., 8992; in the autumn term of 1928, the enrollment was 11,816, and the summer session enrollment in that year 6041. The faculty increased over the same period from 608 to 657, on a full-time basis, including professors, associate professors, assistant professors, and instructors. The library was increased from 175,000 to 525,000 volumes, and the income from \$2,445,491 to \$2,908,006 from endowment funds, service enterprises, revolving funds and intercollegiate athletics; \$1,686,862 from student fees and miscellaneous items; \$4,637,902 from State appropriations for maintenance, building, and special purposes for 1927-28; and \$293,634 Federal Aid. The endowment of the university amounted to

\$9,245,417 in 1928, including a permanent fund of \$3,914,887, and lands and buildings in trust, \$1,590,837.

Under a legislative appropriation voted in 1919, of \$500,000 annually for 10 years, the following new structures were finished or in course of construction during succeeding years: On the main campus, a music building, mines experiment station, library, storehouse and shops, an addition to the Minnesota Union, an administration building, a botany building, physics building, and a field house for athletics; a Memorial Auditorium to cost \$1,000,000, of which \$800,000 was available (still under construction in 1928), the Minnesota Hospital and Home for Crippled Children, at a cost of \$851,000, dedicated on November 10, by the late William H. Eustis, donor of \$350,000 toward its construction. Contracts were let before the end of the year for the construction of dormitories. On the farm campus, two home-management houses and a dairy building were constructed, at Crookston, an animal products building, at Morris, a hospital; and at Grand Rapids, the main building of the agricultural school. Dr. William J. Mayo and Dr. Charles H. Mayo of Rochester, Minn., gave over \$2,000,000 for medical research and examination, a trust fund of \$250,000 was established in 1923 by the Citizens' Aid Society of Minneapolis for the erection of the George Chase Christian Memorial Cancer Hospital and, in the same year, a site valued at \$100,000 was given for the Minnesota Hospital and Home for Crippled Children by William H. Eustis, as the first installment of a gift for buildings and grounds for the university which was eventually to amount to \$1,000,000. Pledges to the amount of \$2,000,000 were made by alumni and friends for the erection of an athletic stadium and an auditorium; and two loan funds, one of \$5000 and one of \$12,000, were established in the names of Edward M. and Effie R. Johnson. Gifts received during 1926 included Insurance policies amounting to \$80,000, by Dr. George G. Eitel to found the George G. Eitel Scholarship Fund; a gift of \$100,000 from William H. Eustis; and a gift of \$10,250 annually for five years by the Bureau of Social Hygiene to be used to conduct investigations in cooperation with the Women's Cooperative Alliance of Minneapolis. George Edgar Vincent was president of the university until he resigned in 1916 to accept the presidency of the Rockefeller Foundation, when he was succeeded by Marion LeRoy Burton, who resigned in 1920 to become president of the University of Michigan. President, Lotus Delta Coffman, Ph D., LL D.

MINNICK, JOHN HARRISON (1877-). An American university professor, born at Somerset, Ind., and educated at Indiana, Illinois, Chicago, and other universities. For several years, he taught in high schools in Indiana and Illinois, and from 1911 to 1913, he was critic teacher of mathematics at Indiana University. For two years following, he was instructor in mathematics at the Horace Mann School, New York City. In 1916 he became instructor of mathematics at the University of Pennsylvania and was successively assistant professor of education, professor of education, and dean of the school of education at that university. He was a member of many learned societies, wrote *An Investigation of Abilines Fundamental to Geometry* (1918), and developed standardized tests in geometry.

MINNIGERODE, MEADE (1887-). An American writer, born in London. He graduated from Yale in 1910 and for several years was associated with publishers in New York. He represented the United States Shipping Board in France in 1917-18 and in the year following was first lieutenant with the American Red Cross. His books include *Laughing House* (1920); *The Big Year* (1921); *O, Susanna* (1922); *The Fabulous Forties* (1924); *Aaron Burr* (with S. H. Wandell, 1925); *Some American Ladies* (1926); *Certain Rich Men* (1927); *Jefferson, Friend of France* (1928); *Presidential Years: 1787 to 1860* (1928).

MINOT, GEORGE RICHARDS (1885-). An American physician born in Boston, Mass. In 1926 he and an associate published a valuable method of treating pernicious anemia—a condition previously regarded as incurable. He was graduated from Harvard University in the arts (1908) and in medicine (1912). Early in his medical career, he began to specialize in the study of the blood and its diseases and by 1924 had written over 50 papers on this subject. He was made an associate professor of medicine at Harvard and for a time was editor of the *Boston Medical and Surgical Journal*. The impetus to the anemia treatment came originally from some laboratory results on the treatment of artificial anemia in dogs by fractions of extract of liver. Dr. Minot with his associate, Dr. Murphy, applied the principle to the treatment of pernicious anemia in man with strikingly favorable results originally published in the *Journal of the American Medical Association*. The method has now been tested throughout the world in more than 2000 cases with less than 1 per cent of failures.

MIOMANDRE, FRANCIS DE (1880-). A French novelist, born at Tours, and educated at Marseilles. He began writing in his early twenties and won the Prix Goncourt in 1908 for his novel, *Ecrit sur de l'Eau*. His novels were highly imaginative and put together with the genuine talent of a romancer who has traveled far and wide at his own study table. His works include: *Du Vent et de la poussière*; *L'Ingénu*; *L'Aventure de Thérèse Beauchamps*; *Le Veau d'Or et la vache enragée*; *Les Taupes*; *Ces petits Messieurs*; *Les Jours de l'amour et de la danse*; *La Cabane d'amour*; *Journal interrompu*; *Pavillon du mandarin*; *Voyages d'un sédentaire*, essays; *La naufragée* (1924); and *Les équivoques d'amour*, a play (1928). Consult *Le roman nouveau* by Jules Bertaut (1920).

MIQUELON. See ST. PIERRE AND MIQUELON.

MISSISSIPPI. The thirty-first State in size (46,865 square miles) and the twenty-third in population; capital, Jackson. The population decreased from 1,797,114 in 1910 to 1,790,618 in 1920, a loss of 0.4 per cent. The white population rose from 786,111 to 853,962, but was still greatly exceeded by the Negro population, in spite of the fact that the number of Negroes decreased from 1,009,487 to 935,184 during the decade. The native white population increased from 776,722 to 845,943, while the foreign-born white decreased from 9389 to 8019. The urban population of the State mounted from 207,311 to 240,121; the rural population, on the other hand, decreased from 1,589,803 to 1,550,497. The growth of Meridian was from 23,285 in 1910 to 23,399 in 1920; Jackson, 21,262 to 22,817. Vicksburg, with 20,814 in 1910 and 18,072 in 1920, showed a decrease.

Agriculture. As cotton raising is one of the chief agricultural industries of the State, conditions of late years have been greatly affected by the ravages of the boll weevil, which occupied most of the State by 1909 or 1910. Its effect is indicated by the acreage and production of various years during the period: in 1913, 3,067,000 acres and 1,311,000 bales; 1917, 2,788,000 and 905,000; 1921, 2,628,000 and 813,000; 1928 (estimated), 3,994,000 acres and 1,470,000 bales, a total indicative of progress toward recovery. For a more detailed account of the ravages of the boll weevil in the cotton-growing States, see **BOLL WEEVIL**.

The number of farms, almost stationary from 1910 to 1920, decreased from 272,107 in 1920 to 257,228 in 1925, or by 5.5 per cent. The area of land in farms decreased 11.8 per cent, or from 18,196,979 to 16,053,243. The improved land in farms in 1920 was 9,325,677 acres; the total percentage of land used for agricultural purposes decreased from 61.3 in 1920 to 54.1 in 1925. The total value of farm property rose from \$426,314,634 in 1910 to \$964,751,855 in 1920, but declined to \$550,570,838 in 1925; the average value per farm was \$1554 in 1910, \$3546 in 1920, and \$2140 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 80,808 were operated by owners; 678, by managers; and 175,742, by tenants. The comparative figures for 1910 are 92,066; 825; and 181,491. White farmers in 1920 numbered 110,882, compared with 107,086 in 1925; colored, 161,219, compared with 150,142 in 1925. There was a decrease in the Negro population, 1910-20, of 7.4 per cent, which quite seriously affected the farm-labor situation. Farms reported as under mortgage in 1920 numbered 23,990 and 26,750 in 1925. The number of dairy cows in 1920 was 530,274; in 1925, 320,055; "beef" cows, 261,682 in 1920, numbered 208,460 in 1925; swine, 1,373,311 in 1920, were 697,472 in 1925, mules numbered 308,216 in 1920; 327,646 in 1925; sheep, 164,440 in 1920 and 113,824 in 1925. The estimated production of the chief farm crops in 1928 was as follows: Corn, 22,945,000 bushels, oats, 820,000; potatoes, 1,330,000; sweet potatoes, 6,050,000; hay, 601,000 tons; peanuts, 6,500,000 pounds (For cotton, see above). Comparative figures for 1913 are corn, 63,000,000 bushels; oats, 2,800,000; potatoes, 960,000; and hay, 293,000 tons.

Manufactures. Although Mississippi is not one of the leading industrial States, it has important lumber and cottonseed-oil industries.

Education. Mississippi has educational problems of great difficulty. The colored population exceeds the white, and in addition to this, the rural localities are many of them thinly populated, and widely extended. In dealing with the problem, notable advances have been made. There was put into operation a splendid system of consolidated schools, which in 1923 numbered 751; and a compulsory school law was put into force, which brought into the schools during the first year of its operation over 33,000 white boys and girls over 7 years of age who had never before attended school. An equalizing school fund was provided, of more than \$1,125,000, to be disbursed by the State Board of Education for the benefit of the poorer sections of the State. The State Normal School, established in 1912, was enlarged, and had at the close of

this period an enrollment of approximately 1500. The trustees of the schools of every county had been organized for several years in the County Trustees' Association, and the 82 county superintendents of the State were organized into a State association. By 1924 the work of rehabilitation of cripples and vocational education had been organized and was producing excellent results. High-school work in over 1000 schools having one- to four-year courses had been standardized. There were 237 four-year accredited high schools, and hundreds of others doing one to three years of accredited work. Enrolled in the colleges of the State by 1923 were as many students as were contained in the high schools in 1913. A \$5,000,000 bond issue has been expended in repairing and expanding the State colleges and institutions. The entire enrollment in the high schools in 1925-26 was 43,105; in the colored high schools alone it was 5156. The total public-school enrollment was placed at 572,896, of whom 290,145 were white and 282,841 colored. The percentage of illiteracy in the State decreased from 26.8 in 1910 to 20.8 in 1920; among the native white population, from 6.2 to 4.4 per cent, among the foreign-born white, from 13.6 to 13.4; among the Negro, from 43.2 to 35.9.

Finance. State expenditures in the year ended Sept 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$12,233,817 (of which \$3,988,337 was aid to local education), interest on debt, \$790,168; for permanent improvements, \$5,557,599; total, \$18,581,584 (of which \$5,637,927 was for highways, \$1,692,015 being for maintenance and \$3,945,912 for construction). Revenues were \$16,394,641. Of this, property and special taxes formed 40.7 per cent; departmental earnings and charges for officials' services, 9.4; sales of licenses and a tax on gasoline, 27.6. Property valuation was \$724,107,850; State taxation thereon, \$4,344,647. Net funded State debt on June 30, 1927, was \$17,142,853.

Political and Other Events. Mississippi has remained steadfastly Democratic. In 1916 Senator Williams was reelected, practically without opposition. For President, Wilson received 80,422 votes; Hughes, 4253. At this election, an amendment was adopted increasing the number of Supreme Court judges to six, to be elected by the people for a term of eight years. In 1917 former Senator Vardaman contested the Senatorial nomination of Representative Harrison, who was nevertheless nominated and elected. Senator Vardaman was opposed by President Wilson. In 1919 Lee M. Russell was reelected governor. In 1922 Hubert Stephens was elected senator. In 1923 Henry L. Whitfield was elected governor. He died Mar 18, 1927, and was succeeded by Dennis Murphree. The vote for President in 1924 was: Davis, 100,475; Coolidge, 8546. Theodore N. Bilbo was elected governor in 1927. In 1928 Smith, for President, gained 124,539 votes; Hoover, 26,889.

MISSISSIPPI, UNIVERSITY OF. A State institution for the higher education of men and women at University, Miss., founded in 1848. With the usual exception of the War years, the university grew steadily during the period 1914-28, from an enrollment at the beginning of the period of 528, a faculty of 35, and a library of 25,000 volumes, to an enrollment of 1121 (autumn, 1928), 309 in summer session of 1928, 64 members on faculty, and 40,000 volumes in

the library, at the close. The income of the university also increased, from \$138,226 to \$190,000 from State appropriations, \$98,000 from student fees, and \$52,000 from all other sources. Five new dormitories were constructed, a pharmacy building, and a chapel, for which the Legislature appropriated \$150,000 in 1926. Special appropriations of \$1,600,000 were made by the 1928 Legislature for new buildings and other permanent improvements. A school of commerce and business, and a department of hygiene were opened previous to 1924, and a new department of rural economics and sociology was added in 1926. Alfred Hume, C.E. D.Sc., who had been vice chancellor since 1905 and professor of mathematics since 1890, was elected chancellor, effective Sept. 1, to succeed J. N. Powers, LL.D.

MISSISSIPPI RIVER. See FLOODS AND FLOOD CONTROL.

MISSOURI. The eighteenth State in size (69,420 square miles) and the ninth in population, 1928, 3,523,000. The total population increased from 3,293,335 in 1910 to 3,404,055 in 1920, a gain of 3.4 per cent; estimated population, 1928, 3,523,000. The white population rose from 3,134,932 (1910) to 3,225,044 (1920); Negro, from 157,452 to 178,241; native white, from 2,906,036 to 3,039,018, while the foreign-born white decreased from 228,896 to 186,026. The urban population mounted in the decade from 1,398,817 to 1,586,903; the rural population decreased from 1,894,518 to 1,817,152. The growth of the principal cities was as follows: St. Louis (q.v.), 1910, 687,029; 1920, 772,897; Kansas City (q.v.), 248,381 to 324,410; St. Joseph, 77,403 to 77,939; Springfield, 35,201 to 39,631.

Agriculture. As Missouri is one of the most important agricultural States, conditions have reflected influences which characterized the war and post-war periods. (See AGRICULTURE). Missouri is one of the minor cotton-producing States and while the region where cotton is grown has become infested by the boll weevil, the insect was held back by cold winters and its ravages were not serious. Figures for area and production for several years are 1913, 112,000 acres, production, 67,000 bales; 1920, 136,000 acres, 79,000 bales; 1928 (estimated), 349,000 acres, 146,000 bales. It will be noted that, since Missouri suffered less than most other affected States from the boll weevil, there was an increase in the area grown. In Missouri, a decline in the number of farms set in between 1910 and 1920 and continued thereafter. Their number decreased 1 per cent, or from 263,004 in 1920 to 260,473 in 1925. The total area in farms decreased from 34,744,679 to 32,641,893 acres. The improved land in farms totaled 24,832,966 acres in 1920. The percentage of the total land used for agricultural purposes decreased from 79.1 per cent (1920) to 74.2 per cent (1925). The total value of farm property rose from \$2,052,917,488 in 1910 to \$3,591,068,085 in 1920, but fell to \$2,286,639,415 in 1925. The average value per farm was \$7405 in 1910, \$13,654 in 1920, and \$8779 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 174,383 were operated by owners; 1063, by managers; and 85,027, by tenants. The comparative figures for 1910 were 192,285; 2001; and 82,958. White farmers in 1920 numbered 260,178, compared with 273,578 in 1910; colored,

2826, compared with 3666. Farms reported as under mortgage numbered 85,538 in 1920; and 76,970 in 1925. The total number of cattle in 1920 was 2,781,644; in 1925, 2,372,335; dairy cows numbered 1,066,750 in 1920 and 516,787 in 1925; swine, 3,888,677 in 1920 and 3,510,941 in 1925; mules, 255,455 in 1920 and 371,568 in 1925; sheep, 1,271,616 in 1920 and 893,611 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 181,540,000 bushels; wheat, 19,194,000; oats, 44,968,000; potatoes, 10,285,000; sweet potatoes, 1,155,000; hay, 4,340,000 tons; and tobacco, 4,400,000 pounds. Comparative figures for 1913 are corn, 129,062,000 bushels; wheat, 39,586,000; oats, 26,500,000; barley, 110,000; potatoes, 3,230,000; hay, 1,800,000 tons; and tobacco, 3,315,000 pounds.

Mining. Missouri is first among the States in production of lead. Important quantities of coal, clay products, and cement also are produced, but it is the lead industry which gives it its chief importance as a mineral-producing State, with a rank of sixteenth in value of mineral products in 1926. Fluctuations in production of lead in the period from 1914 on are indicated in the following figures: 1914, 192,612 short tons, valued at \$15,023,736; 1916, 233,088, \$32,166,144; 1917, 234,156, \$40,274,832; 1919, 163,290, \$17,308,740; 1920, 165,114, \$26,418,240; 1921, 180,085, \$16,207,650; 1922, 178,412, \$19,625,320; 1926, 207,012, \$33,121,020; 1927, 198,760, \$25,043,760. The greater part of the output is obtained from the southeast and central parts of the State. Coal production varied in the decade from 3,935,980 short tons in 1914 to 4,742,146 short tons in 1916; 5,667,730 in 1918; 5,309,565 in 1920; 3,551,621 in 1921; and 3,008,495 in 1926. Clay products during the recent years have ranged in value from \$6,077,284 in 1914 to \$9,155,088 in 1918; \$17,474,542 in 1920; \$10,668,691 in 1921; \$17,618,931 in 1926. The increased value in the War period was due chiefly to changes in the buying power of currency which led to higher prices, since production was not greatly increased. The output of cement has grown gradually to 7,639,966 barrels per year, in 1926; yearly value increased from \$4,485,744 in 1914 to \$12,917,342 in 1926. During the period affected by the World War the cement produced commanded high prices due chiefly to the decreased buying power of money. The total value of the mineral products of the State for 1926 was \$90,003,537, compared with \$90,994,479 in 1920; \$61,862,232 in 1919; \$76,663,995 in 1918; and \$48,597,593 in 1914.

Manufactures. Missouri is an important industrial State. There were according to the 1920 census, 13 cities with more than 10,000 inhabitants, containing 39.8 per cent of the total population of the State. In 1919 they reported 75.6 per cent of the value of the State's manufactured products. There were in the State, in 1909, 8375 establishments; in 1919, 8592; and in 1925, 5100; and in 1927, 5422. Persons engaged in manufactories numbered 185,705, 244,939, 104,689, and 195,378, in those years. Capital invested amounted to \$444,343,135 in 1909, and \$938,760,773 in 1919. The value of manufactured products in 1909 was \$574,111,070; in 1919, \$1,694,208,338; in 1925, \$2,849,729; in 1927, \$1,665,173,465. The increase in value of the product about 1919 was due largely to changes in industrial conditions brought about by the War and cannot properly be used to measure the

growth of manufactures during the census period 1914-19; but the increase in number of wage earners indicated growth in the manufacturing activities of the State. Slaughtering and meat packing form the first industry in point of value of products, which amounted in 1909 to \$79,581,000; 1919, \$247,477,000; and 1925, \$175,392,412. Flour-mill and gristmill products rank high in value: in 1909, \$44,508,000; 1919, \$113,297,000; 1925, \$82,442,041. The manufacture of boots and shoes furnished products of \$48,751,000 in 1909; 1919, \$142,406,000; and in 1925, \$124,327,761. The manufacture of automobile bodies and parts had an output in 1909 valued at \$1,677,000; 1914, \$2,183,000; and 1919, \$71,939,000. The most important manufacturing cities are St. Louis and Kansas City. In St. Louis in 1909, there were 2667 manufacturing establishments, with a product of \$328,495,000; in 1919, 3205 with \$871,700,000; in 1925, products amounted to \$874,557,000. Kansas City in 1909 had 902 with \$54,705,000; in 1919, 997 with \$192,815,000; in 1925, products of \$221,349,000. St. Joseph is also an important manufacturing city, having, in 1909, 261 manufacturing establishments, with a product worth \$17,626,000, in 1914, 267, \$17,068,000; and in 1919, 219, \$50,697,000.

Education. There has been steady development in the educational system of Missouri. The State was divided some years ago into five districts coterminous with the five State teachers'-college districts, in each of which a high school inspector or supervisor was placed, who had his office at the teachers' college and was responsible for the advancement of secondary education in his district. The department also undertook two other outstanding projects, a State-wide survey of educational conditions and the reorganization of curriculum courses of study and standards for classification of high schools of the State. Trained experts were directing both activities. Attention was also given to the development of the rural schools, and there were assigned to this field one rural supervisor for the State and five rural school inspectors; the work of these supervisors was to help the county superintendents in group and community meetings, to inspect rural schools, and, in general, to help teachers in their work. Under the survey plan, attention was given to conferences of teachers, school-board members, and patrons, in the course of which plans for school improvement, better supervision, and improved presentation of the work, together with the individual problems of teachers, were discussed and remedies suggested. The total enrollment in the elementary and high schools in 1913 was 690,484; in 1925-26 it was 723,167, out of a school population (ages 5 to 17 years, inclusive) of 859,037. There were enrolled in elementary grades 612,414, in the secondary grades 110,753 pupils. The total expenditures on public day schools in 1925-26 were; current, \$39,972,574; outlays, \$13,244,530. The percentage of illiteracy in the State decreased from 5.4 in 1910 to 3.8 in 1920: in the native white population, from 4.3 to 2.8 per cent; in the foreign-born white, from 10.2 to 10 per cent; in the colored, from 21.1 to 14.3 per cent.

Finance. State expenditures in the year ended Dec. 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$23,892,125 (of which \$5,497,348 was for local education); for interest on debt, \$3,297,765; for permanent improvements, \$10,601,528; total,

\$46,791,418 (of which \$19,994,908 was for highways, \$1,411,950 being for maintenance and \$18,532,958 for construction). Revenue was \$42,771,958. Of this, property and special taxes formed 32.1 per cent; departmental earnings and charges for services of State officials, 15.4 per cent; sale of licenses and taxation of gasoline, 41.1 per cent. Property valuation was \$4,967,319,670; State taxation thereon, \$3,457,516. Net State funded debt was \$69,958,404.

Political and Other Events. While Missouri was regarded as a solidly Democratic State for many years, it gradually shifted to the doubtful class. It was carried by Roosevelt and the entire Republican State ticket except governor in 1904, by Herbert S. Hadley for governor in 1908, and by the Republicans again in 1910. After the Republican split of 1912, the Republicans gradually developed sufficient strength to elect candidates for governor and United States Senator. In 1914 William J. Stone was elected to the Senate, and the Democrats elected the Representatives in all the districts except two. A proposed prohibition amendment to the constitution was defeated at this election. In 1916 the Democratic nominee for governor, Frederick O. Gardner, was elected; the Democrats elected all the State officers except the State auditor. Wilson received 398,032 votes; Hughes, 369,339. A constitutional amendment providing for State-wide prohibition was defeated at this election, but an amendment providing for pensions for the blind was carried. Senator W. J. Stone died in 1918, and X. P. Wilkey was appointed. In the autumn, the Republicans elected their candidate for senator, Selden P. Spencer.

In 1919, Governor Gardner appointed Lieutenant Governor Wallace Crossley as State Fuel Commissioner acting in conjunction with the Federal fuel authorities, to conserve and distribute properly the coal supply when a shortage was threatened by labor trouble in the mines. The Republicans in 1920 elected as governor Arthur M. Hyde, and reelected Senator Spencer. In the presidential election, Harding received 727,162 votes; Cox, 574,799. By referendum vote, the people approved the enforcement of prohibition throughout the State. In 1922 Senator James A. Reed, although he was bitterly assailed for his failure to support President Wilson in the Senate, and although the former President strongly voiced his objection to Reed, was nominated. In the election, he defeated the Republican candidate, R. R. Brewster. During 1923 at St. Joseph, a trial of 76 so-called radicals, including William Z. Foster and others, was conducted. Foster was acquitted, but several others were convicted. Sam A. Baker, Republican, was elected governor in 1924, the vote for President was: Coolidge, 648,486; Davis, 572,753. Harry B. Hawes, Democrat, was elected senator in 1926, and a workman's-compensation system was approved by popular vote. A tornado demolished a part of St. Louis, doing about \$25,000,000 of damage, Sept. 20, 1927. The Mississippi Valley floods in the spring of 1927 did great damage. In 1928 Henry S. Caulfield, Republican, was elected governor; the vote for President was: Hoover, 834,080; Smith, 662,076.

Legislation. The Legislature of 1915 enacted a measure designed to prevent dishonest advertising. In 1917 the Legislature amended the laws relating to criminal procedure and abolished capital punishment, which was restored in 1919 at an extra session. An income tax was

created and corporation, inheritance, and secured-debt tax laws were passed. The secured-debt law was declared unconstitutional. The banking laws were also amended in important details. By a provision of the Legislature in 1919, women were permitted to vote for President. The Legislature enacted a child-labor law and a workmen's-compensation law, the latter annulled by referendum. The Legislature of 1921 created a Commissioner of Agriculture; passed measures for the relief of the deserving blind; created a State Department of the Budget and social-welfare boards in cities of the second and third class; amended the child-labor laws, and created municipal cooperative courts in all counties having a population between 19,000 and 150,000. The laws creating offices of Commissioner of Agriculture and Department of the Budget were later suspended by referendum and defeated.

The Legislature created a State Highway Commission in 1921 and provided for the construction of 7600 miles of hard-surfaced roads from a bond issue of \$60,000,000 voted by the people, supplemented by Federal aid. The issuance of \$15,000,000 in bonds was authorized for the payment of a soldiers' bonus. There was created the State Department of Finance and a resolution was passed to submit to the voters an amendment enabling women to hold any office in the State. This Legislature also provided for a system of workmen's compensation. This was suspended by referendum. In 1923 the Legislature passed a general prohibition act and enacted measures to extend the voting privilege equally to men and women. A municipal zoning act was passed in 1925. Incorporation laws were liberalized in 1927, and a State Department of Labor and Industrial Inspection, uniting two former Departments, was created, while State bank requirements were rendered more stringent.

MISSOURI, UNIVERSITY OF. A coeducational State institution at Columbia and Rolla, Mo., founded in 1830. The student enrollment increased from 2005 in 1914 to 4439 in 1928, with 2169 registered in the summer of 1928; the faculty in the same period from 262 to 400 members; the library, from 165,000 to 326,000 volumes; the productive funds from \$1,280,000 to \$2,500,000; and the income from \$1,100,000 to \$3,500,000. A new building for a School of Journalism was given by Ward A. Neff in 1920, and a hospital, a gymnasium for women, a chemistry building, an agricultural building, and a War memorial building were erected in 1922. In 1921, \$50,000 was received for a home economics building; in 1922-23, in memory of their son, Lee H. Tate, Mr. and Mrs. Frank R. Tate gave \$125,000 toward a new law building. President, Stratton Duluth Brooks, LL.D.

MITCHELL, WESLEY CLAIR (1874-). An American economist, who was born at Rushville, Ill., and studied at the University of Chicago (A.B., 1896; Ph.D., 1899) and the universities of Halle and Vienna. He was instructor in economics at the University of Chicago (1900-02), assistant professor of commerce (1902-08) and professor of political economy (1909-12) at the University of California, and professor of economics (1914-19, and since 1922) at Columbia University. From 1919 to 1921, he was lecturer at the New School for Social Research in New York. He served as chief of the price section of the War Industries Board (1918-19). Since 1919 he has been director of research in the

National Bureau of Economic Research. He became chairman of the Social Science Council in 1927. He is the author of *A History of the Greenbacks* (1903); *Gold Prices and Wages Under the Greenback Standard* (1908); *Business Cycles* (1913, 1927). He edited *History of Prices During the War; Business Cycles and Unemployment*. (Consult *Contemporary Economic Thought*, by P. J. Homan, 1928).

MITCHELL, WILLIAM (1879-). An American army officer, born at Nice, France, and educated at George Washington University and the Army Staff College. He was with Gen. Fitzhugh Lee in Cuba and served in the Philippines in 1899. In 1903 he constructed the Alaskan telegraph system and in 1914 joined the French aviation forces in France. He was the first American officer to fly over the lines, commanded the air units of the 1st Army, and was chief of the Air Service in the Argonne offensive. He commanded the air forces at St. Mihiel and served at Cambrai, the Somme, etc. In 1920 he was appointed brigadier general in the Air Service. After four years' service at Washington, he reverted to the rank of colonel. In 1925, because of his criticisms of the War and Navy Departments in connection with their management of aviation, he was tried by court-martial and sentenced to suspension from the service for five years. He resigned in 1926 and lectured in behalf of reform in aviation laws. He wrote *Our Air Force* (1921), *Winged Defense* (1925), and many pamphlets and magazine articles.

MITCHELL, WILLIAM DE WITT (1874-). Attorney General of the United States in President Hoover's Cabinet. He was born at Winona, Minn., and educated at Lawrenceville School, the Sheffield Scientific School of Yale, and the University of Minnesota (A.B., 1895). He studied law, was admitted to the bar, and began practice at St. Paul in 1896. He served as secretary of the first St. Paul Charter Commission in 1900 and was chairman of the Citizens' Charter Commission in 1922. Having been an officer in the National Guard of Minnesota in 1898-1901, he was made colonel of the 6th Regiment during the World War. In 1925 President Coolidge appointed him Solicitor General of the United States. He filled that office with distinction and although in politics a Democrat, he was named Attorney General by President Hoover, in March, 1929.

MLYNARSKI, mlë-nür'skë, EMIL (1870-). A Polish composer and conductor (see Vol. XVI). During 1910-15 he was conductor of the Choral and Orchestral Union at Glasgow. He returned to Warsaw in 1919 to his former posts as conductor at the opera and director of the Conservatory, which latter position he resigned in 1922. He added to his works an opera, *Eine Sommernacht* (Warsaw, 1923), and *Symphony*, in F.

MOBILIZATION. See ARMIES AND ARMY ORGANIZATION.

MOFFAT TUNNEL. See TUNNELS.

MOHAMMED VI (VAHID-ED-DIN) (1861-1926). A Sultan of Turkey, brother of Mohammed V, whom he succeeded in 1918. He lived in seclusion until he became Sultan. After the rise of the Nationalists under Mustapha Kemal Pasha, and particularly after he had signed the Treaty of Sevres, he was merely a figurehead politically, although as caliph he was the supreme authority of the entire Moslem world. In No-

vember, 1922, he was dethroned by the National Assembly and left Constantinople on board the British warship, *Malaya*, bound for Malta. He went to Switzerland and France, where he lived in comparative poverty. He died in San Remo and was buried in Mecca.

MOHLER, JOHN ROBBINS (1875-). An American pathologist, born at Philadelphia, Pa., and educated at Temple University, the University of Pennsylvania, and Marquette University. For several years, he was a practicing veterinarian and was also in the employ of the Bureau of Animal Industry of the Department of Agriculture. In 1891 he was appointed assistant pathologist in the bureau and was successively zoologist, chief of the pathological division, assistant chief, and after 1917, chief of the entire bureau. Besides translating several medical works from foreign languages, he was the author of many articles on pathology, bacteriology, and meat inspection. During the World War, he was a member of the Remount Board of the United States Army.

MOINAUX, GEORGES. See COURTELINE, GEORGES.

MOISSEVITCH, BENNO (1890-). A Russian pianist, born in Odessa. He studied under D. Klimov at the Imperial Musical Academy in Odessa and, after winning the Rubinstein Prize at the age of nine, completed his education under Leschetizky in Vienna (1904-8). He made his debut in Reading, England, in 1908, and the next year took London by storm. His success was such that for the following 10 years he was on concert tour exclusively in England, appearing in numerous recitals and with all the important symphony orchestras. In 1919 he made his first tour of the United States, after which he visited all the countries of the civilized world. In 1914 he married the Australian violinist, Daisy Kennedy, from whom he was divorced in 1924.

MOLDAVIA. See RUMANIA.

MOLEY, RAYMOND (1886-). An American educator, born at Berea, Ohio, and educated at Baldwin-Wallace College, Oberlin College, and Columbia University. He taught in several schools in Ohio until 1914. In 1916 he was appointed instructor and assistant professor of politics at Western Reserve University and from 1919 to 1923 was director of the Cleveland Foundation. Since 1923 he has been associate professor of government at Columbia. He was research director of the New York State Crime Commission, 1926-27. He wrote *Lessons in Democracy* (1919); *Commercial Recreation* (1919); *Facts for Future Citizens* (1922); *The Cleveland Crime Survey* (1922); *The Outline of Government* (1922); *The Administration of Criminal Justice in Missouri* (1926); *The Practice of Politics* (brochure, 1927); and various pamphlets and articles on the teaching of government. He was coauthor of *Criminal Cases in New York Courts* (1927).

MOLINARI, mō'lē'nā'rē', BERNARDINO (1880-). An Italian conductor, born in Rome. He began to study the piano at the age of five and continued his musical education at the Liceo Santa Cecilia in Rome, under Sgambati, Marchetti, and Falchi. He began his career as accompanist of famous visiting artists. In 1909 he was appointed assistant conductor of the Santa Cecilia Orchestra, becoming regular conductor in 1914. In 1920 he began to make extended tours as guest-conductor. Since 1927,

when he made his American debut with the St. Louis Symphony Orchestra (December 29), he has visited this country every year, directing several of the great orchestras. In 1929 he was appointed, together with Toscanini and Mengelberg, conductor of the New York Philharmonic-Symphony Orchestra.

MÖLLER VAN DEN BRUCK, ARTUR (1876-1925). A German writer on literature, economics, and sociology, born at Solingen. He was educated and spent several years traveling in Germany, Austria, France, Italy, England, Scandinavia, and Russia. Besides editing the works of Dostoevski, he is the author of *Die Moderne Literatur in Gruppen und Einzeldarstellungen* (1900); *Die Variété: eine Kultur-dramaturgie* (1901); *Die Deutschen: Unsere Menschheitsgeschichte* (1904); *Zeitgenossen* (1905); *Die Italienische Schönheit* (1913); *Der Preussische Stil* (1915); *Das Recht der Jungen Völker* (1918); and *Das Dritte Reich* (1923).

MOLNÁR, FFRENC (1878-). A Hungarian playwright whose first New York success was *Liliom* (1922), presenting a penetrating study of characteristic tendencies in an uncouth man. He was further represented on the New York stage by *Launzi* (1923); *Fashions for Men* (1923); *The Swan* (1923); *The Guardsman* (1924); *The Glass Slipper* (1925); *The Play's the Thing* (1926); and *Olympia* (1928). In 1928 English translations of *Twenty-Five Plays* were published.

MOLTKE, mōlt'kē, RAIMUND HERMANN SIEGFRIED (1869-). A German writer and economist. He studied in Leipzig and at the Art Academy in Berlin and later became librarian of the Chamber of Commerce of Leipzig. His most important works, on economic and historical subjects, are *Leipzigs Handelskorporationen* (1907); *Zwei Kapitel aus Leipzigs Handels- und Verkehrsgeschichte* (1912); *Friedrich List* (1913); *Katalog Altkaufmannischer Archive in Leipzig* (1913); *Die leipziger Messen im Weltkrieg* (1920); *Aus Vergangenheit und Gegenwart der leipziger Kaufmannschaft* (1926). He also wrote *Siegfried von Schwarzburg*, a novel (1927), and edited F. A. Weber's *Handbuch der deutschen Sprache* and other works.

MOLUCCA. See DUTCH EAST INDIES.

MOMBERT, mōm'bērt, ALFRED (1872-). A German poet, born in Karlsruhe and educated at the universities of Heidelberg, Leipzig, Munich, and Berlin. He practiced law for six years and then devoted himself to his literary work. His works include. *Der Sonnengeist* (1905); *Acon, der Weltgesuchte* (1907); *Acon vor Syrakus* (1911); *Der Himmlische Zecher* (1909); *Der Held der Erde* (1919); *Acon Zwischen den Frauen* (1920); and *Atar* (1925).

MOND, SIR ALFRED. See MELCHETT, FIRST BARON.

MONDELL, FRANK WHEELER (1860-). An American public official, born in St. Louis, Mo., and educated in the public schools. For many years, he was engaged in farming, stock-raising, and railroad construction. In 1887 he settled in Wyoming, where he took an active part in the development of the State. In 1909 he was elected a member of the first State Senate. He was elected to the 54th and 56th Congresses and was successively reelected until 1922, when he was defeated. In the 66th and 67th Congresses, he was majority leader on the floor of the House and took a prominent part in framing the legislation passed by that body. He

took an active part in all the Republican conventions from 1902, and in the convention of 1924 was permanent chairman. In 1923-25 he was a director of the War Finance Corporation.

MONET, mōnĕ, CLAUDE (1840-1926). A French landscape painter (see VOL. XVI). He was considered the foremost landscape painter of impressionism. In his last years, he was troubled with cataract, but was able to work intermittently on several large paintings arranged in groups of three to five. The subjects were chiefly water-lilies, and the large group which he presented to the French nation was placed on permanent exhibition in a room built for it in the Orangeries in the Tuileries Gardens, Paris.

MONGOLIA. A Chinese outer territory, with an estimated area of 1,875,000 square miles, and a population variously estimated from 750,000 to 2,500,000. The difficulties of communication because of lack of railways and the obstacles presented by the barren reaches of the Desert of Gobi, which cuts into the heart of the region, make for a sparsely settled population. Agriculture is impossible, with the result that the inhabitants are hunters and raisers of camels, horses, and sheep. The Chinese are steadily penetrating into Inner Mongolia and the Desert of Gobi and beginning to apply themselves to the tillage of the soil. Inner and Outer Mongolia were joined in 1917 by a motor transport service plying between Urga and Kalgan. Urga was the chief town and centre of population. During recent years, Mongolia's fortunes were linked with those of Russia and China. Up to the Revolution, Russian penetration into Outer Mongolia continued. The overthrow of the Czar not only checked the completion of these enterprises but also put Outer Mongolia at the mercy of marauding bands. In November, 1919, the reigning prince, the Living Buddha or Hutuktu, prompted by his advisers, asked for the cancellation of the charter of independence; some days later, the Chinese government acceded by denouncing the Russo-Chinese and Russo-Mongolian treaties of 1913-14. The Chinese did not maintain their position long. Early in 1921, Baron Ungern von Sternberg, heading remnants of Semenov's anti-Bolshevik troops, marched on the Chinese at Urga, captured the town, and put the garrison to the sword. The Hutuktu was compelled to announce his sovereignty once more, though his policies were plainly dominated by the Baron Ungern. The Peking government was defied, and troops were even sent into Inner Mongolia. Ungern could not stand up against the Bolshevik Army and Russian influence again became paramount; Soviet troops remained at Urga; a Mongolian national government, taking control, adopted a consistently friendly attitude toward Soviet Russia. In 1923 a Russian mission proceeded to Peking for the purpose of restoring friendly relations and reestablishing the economic agreements of 1913-14. In June, 1924, a treaty was signed which called for the restoration of Mongolia to China. Inner Mongolia continues to be administered by Chinese officials appointed through Peking. See CHINA; RUSSIA.

MONITOR. See VESSEL, NAVAL.

MONTAGU, THE RT. HON. EDWIN SAMUEL (1879-1924). An English public official, co-author of the Montagu-Chelmsford Reform Plan (see INDIA). He was educated at Trinity College, Cambridge, and after 1906 was a Liberal member of Parliament for the Chesterton divi-

sion of Cambridgeshire. He was Parliamentary Secretary to the Chancellor of the Exchequer (1906-8), and to the Prime Minister (1908-10), and from that year to 1914, Parliamentary Under-Secretary of State for India. He served as Chancellor of the Duchy of Lancaster in 1915 and as Financial Secretary of the Treasury from 1914 to 1916. He was Minister of Munitions and a member of the War Committee in the latter year and Secretary of State for India when he and Lord Chelmsford urged a limited degree of self-government in India, to be extended if successful (1917-22). He was made a member of the Privy Council in 1914.

MONTAGUE, mōn'tā-gŭ, C(HARLES) E(DWARD) (1867-1928). A British author and journalist, who was educated at the City of London School and at Balliol College, Oxford. In 1890 he joined the staff of the *Manchester Guardian*, by 1896 was chief leader writer, and later became a director of the paper. In 1925 he retired to devote his entire time to the writing of novels. During the World War, he served (1915-19) in France, Belgium, and Germany. His first and last books, *A Hind Let Loose* (1910) and *Right Off the Map* (1927), were political and social fantasies. His other publications were *Dramatic Values*, theatrical criticisms (1911); *The Front Line*, with drawings by Muirhead Bone (1917); *Feery Particles*, short stories (1923); *The Right Place: a Book of Pleasures* (1924); *Disenchantment* (1922); and *Rough Justice*, a novel (1926).

MONTAGUE, WILLIAM PEPPERELL (1873-). An American professor of philosophy, born at Chelsea, Mass., and educated at Harvard University. In 1903 he became a member of the faculty of Columbia University, where he was appointed full professor in 1920. One of the six authors of the Neo-Realist programme, he has written numerous essays on the reduction of consciousness to a form of energy and on the implications of realistic philosophy in the realm of what are ordinarily called spiritual values. *The Ways of Knowing, or The Methods of Philosophy* was published in 1925.

MONTANA. The third State in size (146,997 square miles) and the thirty-ninth in population; capital, Helena. The population increased from 376,053 in 1910 to 548,889 in 1920, a gain of 46 per cent. The white population increased from 360,580 to 534,260; the Indian, from 10,745 to 10,956. There were, in 1910, 1585 Japanese, and in 1920, 1074; the Negro population also decreased, from 1834 to 1658. The native-born white population increased from 286,936 to 440,640; the foreign-born white, from 91,644, to 93,620. Both urban and rural population mounted during the decade, the former from 133,420 to 172,011, and the latter from 242,633 to 376,878. The growth of the principal cities was as follows. Butte, 1910, 39,165; 1920, 41,611; Great Falls, 13,943 to 24,121; Billings, 10,031, to 15,100.

Agriculture. The number of farms, which had increased 120 per cent, or from 26,214 in 1910 to 57,677 in 1920, fell sharply to 46,904 in 1925. The total acreage in farms increased to 35,070,656 (1920) from 13,545,603 (1910) and fell to 32,735,723 (1925). The improved land in farms was 11,007,278 acres in 1920. The percentage of land used for agricultural purposes was 37.5 in 1920, 35 in 1925. The total value of farm property rose from \$347,828,770 in 1910 to \$985,961,308 in 1920, but declined to \$574,-

897,007 in 1925; the average value per farm was \$13,269 in 1910, \$17,095 in 1920, and \$12,257 in 1925. In interpreting these values, the inflation of the currency incidental to the World War is to be taken into consideration. Of the total number of farms in 1925, 36,281 were operated by owners; 367, by managers; and 10,256, by tenants. The comparative figures for 1910 are 23,365; 505; and 2344. White farmers in 1910 numbered 25,018; in 1920, 56,614, of whom 41,051 were native and 15,563 foreign-born. Of the 1063 colored farmers in 1920, 987 were Indians. Farms reported as under mortgage numbered, 29,897 in 1920 and 19,818 in 1925. The number of dairy cows fell from 153,425 in 1920 to 102,768 in 1925; "beef" cows numbered 514,853 in 1920 and 487,663 in 1925; sheep numbered 4,959,835 in 1910, 2,082,919 in 1920, and 2,187,928 in 1925. The area under irrigation increased from 1,679,084 acres in 1909 to 1,681,729 acres in 1919. The estimated production of the chief farm crops in 1928 was as follows: Corn, 5,206,000 bushels; wheat, 77,218,000; oats, 20,221,000; barley, 6,374,000; potatoes, 4,255,000; and hay, 3,103,000 tons. Comparative figures for 1913 are corn, 882,000 bushels; wheat, 20,673,000; oats, 21,750,000; barley, 1,860,000; potatoes, 5,040,000; and hay, 1,188,000 tons.

Mining. Montana is an important State in the production of minerals. In former years gold, silver, and copper were the most valuable products of the mines; zinc and petroleum now rank next after copper. The progress of mining, from 1914 on, is indicated by comparative figures. The production of coal in 1914 was 2,805,173 short tons, valued at \$4,913,191; 1915, 2,789,755 short tons, \$4,526,509; 1917, 4,226,689, \$8,919,136; 1918, 4,532,505, \$11,444,875; 1920, 4,413,866, \$13,923,000; 1921, 2,733,958, \$8,921,600; 1926, 2,797,760, \$6,883,000. The production of silver varied from 12,016,460 fine ounces in 1914 to 16,797,479 in 1918, 12,579,178 in 1920, 12,468,151 in 1922; and 12,769,092 in 1926. In the production of copper, Montana ranks second among the States, being surpassed only by Arizona. In 1914 the copper output was 233,229,640 pounds; 1916, 352,928,373; 1918, 323,174,850, 1920, 177,059,260; 1921, 48,098,730; and 1926, 255,372,862. The diminished production in 1921 was due chiefly to business depression which diminished the demand for copper. Comparative figures for gold, lead, and zinc are as follows: 1914, gold, \$4,117,911; lead, 9,656,008 pounds, zinc, 111,580,544 pounds; 1918, gold, \$3,104,764; lead, 37,135,875 pounds; zinc, 209,258,148 pounds; 1921, gold, \$1,480,763; lead, 20,366,917, pounds; zinc, 23,275,966 pounds; 1922, gold, \$1,656,757; lead, 29,767,479 pounds; zinc, 11,069,818 pounds; 1926, gold, \$1,250,731; lead, 42,306,000 pounds; zinc, 147,402,000 pounds. A considerable amount of petroleum also is produced in the State, the output increasing from 340,000 barrels in 1920 to 1,509,000 barrels in 1921, and 7,727,000 barrels in 1926. In addition to the minerals noted above, quantities of graphite, iron ore, and manganese ore are produced. The total value of the mineral production in 1926 was \$79,762,630, as compared with \$85,885,403 in 1920; \$73,630,824 in 1919; \$139,331,507 in 1918; and \$54,244,899 in 1914.

Education. Montana has been one of the most efficient States in the conduct of its educational system; the Russell Sage Foundation in 1920 placed the Montana school system first among those of the United States. The public-school fund, which was greatly increased from

time to time by the sale of school lands and by grants of the State, amounted to \$17,437,407 in 1925-26, not counting unsold schools lands, and contributed an annual revenue, together with receipts from leases of school lands, of more than \$1,000,000. The Legislature has been liberal in the enactment of laws relating to schools. Development in vocational education was marked; the Smith-Hughes Law, providing Federal aid to States, was accepted by the Legislature in 1917, and provisions were made for the coöperation of State and local boards of education in vocational training. The boards of trustees of the school districts of the State were authorized to establish and maintain Americanization schools for all mentally normal persons over the age of 16. One phase of the development is indicated by the increase in enrollment; in the public schools in 1914, 85,728 were enrolled; in 1925-26, 116,990 (elementary schools, 96,049). In the high schools of the State, in 1925-26, the enrollment was 20,941. Expenditures for public day schools were: current, \$11,106,389; outlays, \$400,258. The percentage of illiteracy in the State decreased from 5.5 in 1910 to 2.8 in 1920. In the native-born population, it remained for both periods at 0.4 per cent, among the foreign-born white population, it decreased from 9.2 per cent to 6; in the Negro population, it decreased from 12.6 to 8 per cent.

Finance. State expenditures in the year ending June 30, 1927, as reported by the U. S. Department of Commerce, were: for departmental maintenance and operation, \$5,927,691 (of which \$1,318,661 was for local education); for interest on debt, \$427,971; for permanent improvements, \$1,840,264; total, \$8,195,926 (of which \$1,535,279 was for highways, \$281,646 being for maintenance and \$1,253,633 for construction). Revenues were \$8,779,813. Of this, property and special taxes formed 29.3 per cent; departmental earnings and charges for officials' services, 7.3 per cent; sale of licenses and taxes on gasoline, 25.9 per cent. Property valuation was \$435,510,159; taxation thereon by the State, \$1,946,032. Net funded State debt on June 30, 1927, was \$4,751,148.

Political and Other Events. The political control of Montana, for a number of years, has fluctuated between the Republican and Democratic parties. An election held in 1914 for representative-at-large was carried by the Democrats. At this election, a State woman-suffrage amendment was carried. On Sept. 6, 1914, Mayor Lewis J. Duncan of Butte was removed from office after trial in the district court for neglect of duty in connection with miners' strikes. The elections of 1916 were notable in that Jeannette Rankin was chosen the first woman member of the House of Representatives. The Democrats elected their candidate for governor, S. V. Stewart; Henry L. Meyers, Democrat, was reelected to the Senate. In the presidential voting, Wilson received 101,063 votes; Hughes, 66,750. In 1917 there were many industrial disturbances in the mines of the State, and on August 2, Frank Little, organizer and agitator of the Industrial Workers of the World, was lynched in Butte for attempts to organize a strike in the metal mines and for denouncing the Army and the Federal Government. The State was on the point of prosecuting him when he was seized at night and hanged. In the elections of 1918, Miss Rankin was defeated for reelection to the House of Representatives by Carl Riddick. Senator

T. J. Walsh was reelected. The Republicans came into power in 1920 and elected Joseph M. Dixon governor, together with other State officers. For President, Harding received 109,430 votes; Cox, 57,372. In 1922 Burton K. Wheeler, Democrat, was elected United States Senator, and two constitutional amendments were adopted. One permitted the consolidation of city, county, and town governments; the other created a State Board of Equalization. The voters also approved a referendum measure for a soldiers' bonus. This was afterward declared unconstitutional and the Assembly voted to submit to the people an amendment of the constitution to permit the granting of a bonus. The amendment was defeated by popular vote.

In 1924 Senator Walsh practically conducted the investigation into the leasing of oil reserves, while Senator Wheeler was responsible for, and took a prominent part in, the investigation of the administration of H. M. Daugherty, Attorney General of the United States. Senator Wheeler was indicted in Montana for alleged infraction of the law which prohibits members of Congress from taking part in litigation in which the Government is concerned. He was tried and acquitted in 1925. J. E. Erickson, Democrat, was elected governor in 1924. The vote for President was: Coolidge 74,138, Davis, 33,805; LaFollette, 65,876. State prohibition was repealed in 1926 by referendum vote. Erickson was reelected governor in 1928. The vote for President in 1928 was: Hoover, 113,300, Smith, 78,578.

Legislation. The Legislature of 1915 passed a measure providing for the submission of the question of prohibition to the people by referendum, to be voted for in 1916. This was carried. The Legislature of 1917 amended the laws relating to the administration of justice in the courts. It also authorized cities to adopt a commission form of government and amended the prohibition laws. In 1919 a law was passed providing for a State budget. In 1921 the Legislature revised the tax laws and imposed new taxes on the production of oil, gas, minerals etc. In 1920 measures were passed preventing the holding of land by aliens. A measure was also enacted granting a modified old-age pension. Petroleum exploitation was regulated in 1922.

MONTANA, UNIVERSITY OF. A State organization for the higher education of men and women, founded in 1895; a part of the University of Montana, which comprises the State University at Missoula, the State College at Bozeman, the State Normal College at Dillon, and the State School of Mines at Butte. The student enrollment at Missoula increased from 220 in 1910 to 1455 in the autumn of 1928, with 498 in the summer session in the latter year. In 1914-15, the faculty had 84 members, in 1928, 96 members. The library was increased from 100,000 to 145,000 volumes including government documents, between 1923 and 1928. The income for the latter year was \$472,532. Six new buildings were completed in 1923, including a library, gymnasium, forestry building, two residence halls, and a central heating plant. E. O. Sisson was president from 1917 to 1920 and was succeeded by Charles H. Clapp, Ph.D., in 1920.

MONTEMEZZI, ITALO (1875-). An Italian composer, born at Verona. He received his musical education at the Conservatory of Milan. Next to Puccini, he is the most talented of living Italian composers. In 1919 he visited

the United States, conducting the American première of his opera *La Nave* (Chicago Opera Association, Nov. 18), which had its world première in Milan (1918). His other works include the operas, *Giovanni Gallurese* (Turin, 1905; New York, 1925); *Hellera* (ib., 1909); *L'Amore dei Tre Rè* (Milan, 1913; New York, 1914); and *La Principessa Lontana* (not yet produced); and a cantata, *Il Cantico dei Cantici*.

MONTENEGRO. The history of this state during the World War was obscure, both because of its military unimportance, and more largely, because of its doubtful loyalties. From 1914 to 1918, a division of sentiment ever widened the breach between the partisans of the ruling family and the growing group that looked to Serbia for the fulfillment of racial and nationalistic aspirations. On Aug. 8, 1914, Montenegro declared war on Austria-Hungary. The fear on the part of King Nicholas and his sons that victory for the Allies would mean the submergence of their dynasty led in 1915 and 1916 to a series of intrigues with Austria whose purpose was interpreted by Slav patriots as an endeavor to erect a Slav state in the South, ruled by one of Nicholas's sons and virtually under Austrian domination. Montenegro was overrun by the Austrian Army early in 1916; in the same year, having failed to win over the Central Powers, Nicholas abandoned his country and retired to France. This absence strengthened the hand of the Slav Nationalists. In 1917 Montenegrins met with Serbs, Croats, and Slovenes at Corfu, where the pact setting forth their common principles was issued. When, in 1921, the Montenegrin delegates to the Yugoslav Constituent Assembly voted in favor of union, the history of Montenegro as an independent state was closed. See **JUGOSLAVIA**, under *History*.

MONTEUX, PIERRE (1875-). A French conductor, born in Paris. He studied at the Paris Conservatoire under Berthelet (violin, first prize), Lavignac (harmony), and Leneveu (fugue). For some years, he played the viola, first in Colonne's orchestra, then at the Opéra Comique, and during this period appeared with various ensemble organizations. In 1904 he began his career as conductor with the Concerts Monteux in Paris, at which he produced chiefly new works of impressionist composers. In 1911 he became conductor for Diaghilev's Ballet Russe in Paris and subsequently made four European tours with that organization, with which he also came to the United States in 1916. During the summer of 1917, he gave a series of concerts with the Civic Orchestra in New York, and from 1917 to 1919, he was conductor of the French operas at the Metropolitan Opera House. From 1919 to 1924, he was conductor of the Boston Symphony Orchestra. When he assumed the leadership, the once famous orchestra was almost completely demoralized (see **MUSIC**, under *Orchestras*), but he was able to bring the organization back to its former high level of excellence. In the spring of 1928, he was guest-conductor of the Philadelphia Symphony Orchestra, and in the fall of the same year, of the Concertgebouw Orchestra in Amsterdam.

MONTFORT, MON'fôr, EUGÈNE (1877-). A French novelist who was the editor of the literary review, *Les Marges*. In his novels, he showed a predilection for the sea, particularly for the picturesque Mediterranean and the port of Marseilles, and in several of his books he

showed himself a master of description and psychological analysis. His works include: *Lcs Cœurs malades* (1904); *Le châtlet dans la montagne* (1905); *La maîtresse américaine* (1906); *La Turquie* (1912); *Les noces folles* (1913); *La belle enfant, ou l'Amour à quarante ans*; *Mon brigadier Triboulère* (1918); *Un cœur vierge* (1920); *La soirée perdue* (1921); *Brelan marin* (1922); *Océar Casteldor* (1927). He edited *Vingt-cinq ans de littérature française, 1895-1920* (2 vols., 1922).

MONTGOMERY, ROBERT HIESTER (1872-). An American lawyer, accountant, and university professor, born at Mahanoy City, Pa., and educated in the public schools. He served as instructor in economics and assistant professor of law at Columbia University from 1912 to 1919, and in the latter year he was appointed professor of accounting there. He served in the Spanish-American War, and during the World War was attached to the General Staff in Washington. He also served on the War Industries Board and in several other important capacities. He was a member of many legal and economic societies and author of *Income Tax Procedure* (1917-22); *Excess Profits Tax Procedure* (1920); *Auditing Theory and Practice* (1912-27); *Auditing Principles* (1923); *Financial Handbook* (1925).

MONTHERLANT, HENRY DE (1896-). A French author who glorified sport. Born in Paris, he was educated in a Roman Catholic college. He learned the art of bullfighting and excelled in many sports. His works include *La Relève du Matin*, a religious novel (1920); *Le Songe* (1922); *Chant funèbre pour les morts de Verdun* (1924); *Le Paradis à l'ombre des épées* (1924); *Les Onze devant la porte dorée* (1924), and *Les Restataires* (1926; trans. as *The Bullfighters*, 1927). Consult *Jeunes Maîtres, États d'âme d'aujourd'hui*, by Paul Archambault (1926).

MONTREAL. The commercial metropolis of Canada. The population by the census of 1926 was 952,875; in 1928 it was estimated to be 1,032,385. The municipal area is 50 square miles. The city administration consists of a council of 35 aldermen elected every two years, one for each ward, with a mayor elected by the citizens at large, also for a term of two years, and an executive committee of five appointed by the council from among its members. The executive committee administers the affairs of the city generally, reporting to the city council which may adopt, amend, or reject such reports by a majority vote of all the members of the council. The director of departments, appointed by the council, serves as a link between the executive committee and the heads of the various departments in somewhat the same manner as a city manager.

Montreal is the largest inland port in the world, being located at the head of deep-water navigation on the St. Lawrence River, 1000 miles from the sea at the junction of ocean and inland navigation. It is approached by a ship channel of 30-foot depth at low water, which is being increased by the Dominion government to a depth of 35 feet. It is also the terminus of three systems of canals—the St. Lawrence canals, the canals of the United States via the Richelieu River and Lake Champlain, and the Ottawa River Canals. The jurisdiction of the harbor, which extends 16 miles along each bank of the St. Lawrence, is entrusted to a board of

Dominion representatives and representatives of the shipping interests and the city corporation. The port has nine miles of deep draft wharfage, capable of accommodating 100 large ocean steamers; four fireproof grain elevators, with a capacity of 15,162,000 bushels, from which grain can be delivered simultaneously at a maximum rate of 500,000 bushels per hour, while at the same time inland vessels and railway cars can be unloaded at a maximum rate of approximately 300,000 bushels per hour; a cold storage warehouse of 4,628,000 cubic feet capacity; 26 permanent fireproof, two-story transit sheds; and an electrified terminal railway system of about 70 miles operated by nine 100-ton electric locomotives. During 1927, 1610 ocean-going vessels of a net registered tonnage of 4,992,486 were entered and cleared. In 1928 Montreal established a new high record in the handling of grain, 423,000,000 bushels valued at \$300,000,000 being received and shipped.

Between 1924 and 1929 the Harbor Commission of Montreal constructed the South Shore Suspension Toll Bridge over the St. Lawrence. The cantilever section included a 1097-ft. span with two 420-ft. anchor arms and a vertical clearance of 163 feet. At the north end of the bridge was a 200-ft. reinforced concrete viaduct.

Montreal has important manufactures of boots and shoes, electrical appliances, sugar, textiles, and lumber. In 1926, 96,141 persons were employed in 1736 manufacturing establishments and received \$109,364,475 in wages; the value of products manufactured was \$556,236,407. The total assets of Montreal's 10 banks are \$1,500,000,000, which is approximately 50 per cent of the total assets of all Canadian banks. The assessed value of Montreal real estate in 1928 was \$1,160,956,007. In 1928, 6639 building permits valued at \$36,284,181 were issued. Recent building activity includes the construction of two new terminals for the Canadian Pacific and Canadian National Railways and of a new hotel of distinctive design erected by the Canadian Pacific Railway. On Oct. 1, 1928, the first international airmail service between Canada and the United States was inaugurated by a flight from Montreal to Albany.

MOON. See ASTRONOMY.

MOON, PARKER THOMAS (1892-). An American professor of international relations, born in New York City and educated at Columbia University. In 1913-14 he was William Mitchell fellow at Columbia and he was Gilder fellow in 1914-15. In the latter year, he was appointed instructor in history, and in 1919, assistant professor, at Columbia. Since 1925 he has been assistant professor of international relations. In 1921 he became managing editor of the *Political Science Quarterly*. He was a member of the staff of the American Commission to Negotiate Peace in 1918-19. He is a member of several economic societies, and author of *A Syllabus of Imperialism and World Politics* (1919); *The Labor Problem and the Social Catholic Movement in France* (1921); *Modern History*, with C. J. H. Hayes (1923); *International Relations* (1925). He also contributed to periodicals and year books.

MOORE, ALEXANDER POLLOCK (1867-). An American newspaper owner and diplomat. He was born at Pittsburgh, Pa., and as a boy went into newspaper work, becoming reporter, city editor, managing editor, and publisher. He was part owner of the *Pittsburgh Telegraph* and

Chronicle-Telegraph, managing editor of the *Pittsburgh Press*, and after 1904 editor-in-chief of the *Pittsburgh Leader*. In 1912 he attracted national attention by his support of the Roosevelt Progressive movement. He purchased the *New York Daily Mirror*, "tabloid," and the *Boston Advertiser* in 1928. He served as Ambassador to Spain (1923-25) and as Ambassador to Peru after 1928. In 1912 he married Lillian Russell (died, 1921), the singer and actress.

MOORE, CLARENCE LEMUEL ELISHA (1876-). An American mathematician born near Bainbridge, Ohio, and educated at Ohio State University and Cornell. He was assistant in mathematics at Ohio and held a similar appointment at Cornell. In 1904 he was called to the Massachusetts Institute of Technology, where in 1920 he became professor. Among the subjects in which he has made special investigations are geometry of the sphere, geometry of the circle in space, and the differential geometry of hyperspace.

MOORE, GEORGE (1852-). An Irish author (see VOL. XVI). A stylist who lived in England, he was not sympathetic either with the literary revival in his native land, or with other literatures of the period. His later works were *The Brook Kerith* (1916); *A Storyteller's Holiday* (1921); *Heloise and Abelard* (1921); *In Single Striptness* (1922); *Ulick and Soracha* (1926); and a play, *The Making of an Immortal* (1928).

MOORE, GEORGE EDWARD (1873-). A British philosopher. He was educated at Trinity College, Cambridge, and worked there as fellow (1898-1904), lecturer on moral science (1911-25), and then as professor of mental philosophy and logic. He became one of the leaders of the realistic group of philosophers, constituted around the scientific researches of which Cambridge was the centre. His volume on *Principia Ethica* (1903) was an attempt to apply the method of scientific realism to the field of morality and value judgments, but the attempt was only partially successful. Among his other works are a popular exposition of ethical theory (*Ethics*, 1912) and a volume entitled *Philosophical Studies* (1922). In 1920 Professor Moore became the editor of the British philosophical periodical, *Mind*.

MOORE, HARRY TUNIS (1874-). An American Protestant Episcopal bishop, born at Delavan, Wis., and educated at Hobart College and the Western Theological Seminary. In the same year, he was ordained in the Protestant Episcopal Church and served as rector in several cities of Nebraska, Texas, Illinois, and other States. He was rector of St. Matthew's Cathedral in Dallas, Texas, 1907-17, and in the latter year was appointed coadjutor bishop of the Diocese of Dallas. Since 1924 he has been bishop of the same diocese.

MOORE, HENRY LUDWELL (1869-). An American economist, born in Charles County, Md. He studied at Randolph-Macon College, and in Vienna, and at Johns Hopkins University, where during 1896-97 he was instructor of political economy. In 1897 he became professor of political economy at Smith College (Northampton, Mass.). From this position he resigned in 1902 to accept a similar chair at Columbia University. He retired in 1929. In addition to many articles on the statistical aspects of his specialty, he is the author of *Laws of Wages* (1911); *Economic Cycles, Their Law and Cause* (1914);

Forecasting the Yield and Price of Cotton (1917); *Generating Economic Cycles* (1923).

MOORE, HENRY THOMAS (1886-). An American psychologist and college president, born at Ansonville, N. C., and educated at Yale and Harvard Universities. He taught at Simmons College and in 1915-17 and 1919-25 at Dartmouth. Since 1925 he has been president of Skidmore College at Saratoga Springs, N. Y. He also edited the *Journal of Abnormal and Social Psychology*. He is the author of *The Genetic Aspect of Consonance and Dissonance* (1914); *Pain and Pleasure* (1917); and *Modern Psychology for the Beginner* (1922).

MOORE, HUGH KELSEA (1872-). An American chemical engineer, born at Andover, Mass., and educated at the Massachusetts Institute of Technology. He was connected with the American Electrolytic Company and with the Burgess Sulphite Fibre Company (1903-10). On the consolidation of several sulphite paper pulp mills as the Brown Company, he became its chief chemical engineer. His original investigations were chiefly concerned with various processes in paper pulp making and its bleaching, on which he obtained many patents. He invented a continuous process for the hydrogenation of oils, and in 1897, the unsubmerged cathode cell. In 1920 he received the gold medal of the American Institute of Chemical Engineers. During the World War, he was a member of the Council of National Defense and also a member of the division of chemistry of the National Research Council. He invented and patented a new method of making calcium arsenate (1925-27) and a new acid-resisting hydraulic digester cement (1926-27). In addition to many chemical papers, he is the author of *The Human Elements in the Mill* (1918) and *Why the Church Fails to Interest People Enough to Attend* (1918).

MOORE, JOHN BASSETT (1860-). An American jurist and diplomat (see VOL. XVI). He served as delegate to the Pan-American Financial Congress in 1915 and was vice president of the International High Commissions organized by that conference. In 1921-28 he served as judge of the Permanent Court of International Justice. As ambassador extraordinary and U. S. delegate, he presided at the International Conference at The Hague in 1922-23 on Rules for Aircraft and Radio in Time of War. He was awarded the Roosevelt Distinguished Service Medal in 1927. His later works on politics and diplomacy included *Principles of American Diplomacy* (1918) and *International Law and Some Current Illusions* (1924).

MOORE, JOHN MONROE (1867-). An American bishop of the Methodist Episcopal Church, South, born at Morgantown, Ky., and educated at Lebanon College and Yale and in Germany. He was ordained in the Methodist Episcopal Church, South, and filled pastorates in St. Louis, Mo., and San Antonio, and Dallas, Texas. For several years, he was managing editor of the *Christian Advocate* and he was secretary of home missions of the Methodist Episcopal Church, South, from 1910 to 1918. In the latter year, he was elected bishop and given charge of work in Brazil (1922), in Oklahoma and eastern Texas (1922-26), and in western Texas and New Mexico (1926-). He also served as a general secretary of the Federal Council of Churches of Christ in America. He was the

author of *Etchings of the East* (1909); *The South To-day* (1916); *Brazil—An Introductory Study* (1920); and *Making the World Christian* (1922).

MOORE, RICHARD BISHOP (1871–). An American chemist, born at Cincinnati, Ohio, and educated in England and France and at Chicago University. He was instructor in chemistry at Missouri, during 1905–11 professor of chemistry at Butler College, and thereafter physicist to the Bureau of Soils of the Department of Agriculture. In 1912 he became connected with the United States Bureau of Mines, whose chief chemist he was in 1919–23. Since 1926 he has been dean of science and head of the chemistry department at Purdue University, Lafayette, Ind. His original investigations were largely concerned with the properties of rare gases in the atmosphere, and the metallurgy of rare metals, especially tungsten, uranium, and vanadium, and more recently the metallurgy of radium, on which he wrote valuable papers. He is the author of *A Laboratory Chemistry* (1904).

MOORE, (WILLIAM) UNDERHILL (1879–). An American lawyer and educator, born in New York City and educated at Columbia University. From 1892 until 1907, he practiced law in New York City. After service on the faculty of the Universities of Kansas and Wisconsin, he was appointed professor of law at Columbia University in 1916. He served in the Spanish-American War. He wrote *Cases on Bills and Notes* (1910, 2d ed., 1922) and contributed to the *Columbia Law Review* and other law publications.

MORAND, PAUL (1888–). A French novelist, born in Paris, son of a French father and a Russian mother, and educated at the Sorbonne. He entered the French diplomatic service and was attached to the embassies at London, Rome, and Madrid. As a man of letters, he rose to prominence with his novels and stories of post-war, cosmopolitan Europe, *Tendres Stocks*, stories (1921) and *Ouvert la Nuit*, stories (1922). His other works include *Fermé la Nuit*, stories (1923); *Poèmes* (1924); *Lewis et Irène* (1924); *L'Europe galante* (1925), vol. i of *Chronique du XX^e Siècle*, *Bouddha vivant* (1927) being vol. ii; *Rien que la terre*, travel in the Far East (1926); *Le voyage*, on the art of travel (1927); *Mr. U.* (1927); *Paris-Tombouctou* (1928); and *Magie Noire*, African stories (1928). Most of these books have been translated into English.

MORANZONI, ROBERTO (1882–). An Italian operatic conductor, born in Bari. He studied violin with Pier Tirindelli in Venice, and when his father, a military bandmaster, was ordered to Alexandria, he attended the Conservatory there, studying counterpoint under Cicognani. When the latter accepted a call to the Conservatory at Pesaro, Moranzoni followed him, continuing his studies there in composition under Mattioli and Mascagni. In 1901 he began his career as assistant conductor to Mascagni at the Teatro Costanzi in Rome. After conducting in Bologna, Milan, Turin, Paris, and London, he made his American début with *Tosca* with the Boston Opera Company (Nov. 12, 1910), and remained until the dissolution of the organization in 1916. During 1917–24 he was conductor at the Metropolitan Opera House, where he conducted the world première of Puccini's triptych, *Il Tabarro*, *Suor Angelica*, and

Gianni Schicchi (1918). In 1924 he became one of the conductors of the Chicago Civic Opera Company.

MORAVIA. See CZECHOSLOVAKIA.

MORAVIANS. A religious denomination comprising, in the United States, three branches: The Moravian Church (Unitas Fratrum); the Evangelical Union of Bohemian and Moravian Brethren in North America; and the Independent Bohemian and Moravian Brethren Churches. It was formed in Bohemia in 1457 under the leadership of John Huss and Jerome of Prague, and opposed the efforts of Austria and the Roman Catholic authorities to suppress it. At the beginning of the Reformation, it had more than 400 churches. In 1741 Moravians settling at Bethlehem, Pennsylvania, founded the first Moravian Church in the United States. The doctrine is evangelical, without a creed peculiar to itself, and in its policy the denomination follows a modification of the episcopacy, having a ministry of three orders: bishops, presbyters, and deacons.

The *Unitas Fratrum*, the largest branch, is organized in two coordinate provinces: the Northern, with a provincial synod meeting every fifth year (a meeting of the Northern Province is planned for 1930); and the Southern, of which the provincial synod meets every third year. The church maintains five educational institutions. Missionary workers are maintained in southern California and Alaska, and in Nicaragua, the West Indies, Jamaica, Labrador, Surinam, South America, the Himalayas, and Unyanwesi, Central Africa. Publications are the two weeklies, *The Moravian*, and *Der Brueder-Botschafter*, and the monthly, *The Moravian Missionary*. On Jan. 1, 1928, there were: 131 churches; 159 ministers; 26,394 communicant members, although the actual membership was estimated at 36,516; and 123 Sunday schools with 21,534 scholars. These figures may be compared with those of 1916 when there were 110 churches, with 26,373 registered members; and 104 Sunday schools, with 14,954 scholars.

The Evangelical Union of Bohemian and Moravian Brethren in North America, of which the first congregation was organized in 1864, at Wesley, Tex., is under the direction of a synod which meets each year on July 6, the day of the death of John Huss. In 1926 (the latest year for which figures were available) this denomination reported 34 churches in North America with 5241 members and 24 Sunday schools, with an enrollment of 1708; total expenditures were \$12,023; and church property was valued at \$76,700. This shows an increase over 1916, when there were 23 churches with 1714 members; and 20 Sunday schools with 565 scholars. Expenditures for the year amounted to \$5499 and church property was valued at \$19,720.

The Independent Bohemian and Moravian Brethren Churches were founded in 1858 in College Township, Iowa. According to the United States census, there were three churches in 1916, and the same number in 1926; membership dropped from 320 to 303; and scholars of the three Sunday schools decreased from 348 in 1916 to 318 in 1926.

MORESNET. See EUPEN, MALMÉDY, AND MORESNET.

MOREY, CHARLES RUFUS (1877–). An American archaeologist and author, born at Hastings, Mich., and educated at the University of

Michigan. From 1900 to 1903, he was a fellow of the American School at Rome. In 1903-04 he was a fellow at Princeton University, and in 1906 he became head of the Princeton summer school. He was appointed professor of art and archaeology there in 1918. In 1925-26 he was in charge of the American School of Classical Studies in Rome. A member of many learned societies, he was the author of art studies including *East Christian Paintings in the Freer Collection* (1914); *Lost Mosaics and Frescoes of Rome* (1915); *Romanesque Sculpture* (1920); *Sardis*, vol. v (1924).

MORGAN, EDMUND MORRIS, JR. (1878-). An American jurist and educator, born at Mineral Ridge, Ohio, and educated at Harvard University. In 1905 he began practice in Duluth, Minn., remained there until his appointment as professor of law at the University of Minnesota in 1912. From 1917 to 1925, he was professor of law at Yale University. Since 1925 he has held a similar chair at Harvard. In the World War, he served in the judge advocate general's department with the rank of lieutenant-colonel. He was the author of *Cases of Common Law Pleading* (1917) and *Introduction to the Study of Law* (1924).

MORGAN, J(OHN) PIERPONT (1867-). An American financier (see Vol. XVI). He took a prominent part in the financial aspects of the World War and following its outbreak made the first loan of \$12,000,000 to Russia. His firm was appointed commercial agent of the British government in the United States in 1915 and conducted purchases of all munitions and supplies in the United States. In the same year, a loan of \$50,000,000 was made to the French government, and he organized a syndicate of about 2200 banks and floated a loan of \$500,000,000 to the Allies. After the World War, he was frequently called on to advise the American and foreign governments in financial matters and made several trips to Europe to investigate and report on financial conditions there. In 1929 he was one of the unofficial American delegates to the Reparations Conference in Paris. The same year, he received the degree of LL D. from Princeton University.

MORGENTHAU, HENRY (1856-). An American diplomat (see Vol. XVI). In 1913 he was appointed Ambassador to Turkey and served until 1916. During 1914-16 he was in Turkey in charge of the interests of Great Britain, France, Italy, Russia, Serbia, and other countries. In 1919 he was a member of the commission appointed by President Wilson to investigate conditions in Poland. He was appointed Ambassador to Mexico in 1920, but owing to the severance of relations between the United States and that country, he did not serve. He was vice president of the Near East Relief from 1919 to 1921 and chairman of the Greek Refugee Settlement Commission created by the League of Nations in 1923. He wrote *Ambassador Morgenthau's Story* (1918) and *All In a Lifetime* (1919). Decorations were conferred on him by various countries for his services during the World War.

MORINI, ERIKA (1906-). An Austrian violinist, born in Vienna. She received her first instruction from her father, who was the director of his own music school in Vienna, and completed her studies under Otakar Sevcik. Hers is a case of remarkable precocity, for when she made her debut in Berlin, under Nikisch, in

1917, the critics made no allowance for her youth, but spoke of her work as the equal of that of the most famous of the younger generation of violinists. Her American debut at New York (Jan. 26, 1921) was one of the musical sensations of the year. In the next three years, she played with overwhelming success in more than 100 cities of the United States. She made her first visit to London in 1923. Overwork during this tour of England necessitated her retirement for three years, part of which time she spent in further study with Sevcik. She resumed her concerts in 1927 in Europe and America, and proved that she is one of those rare cases, where a child prodigy has developed into a really great artist.

MORISON, SAMUEL ELIOT (1887-). An American historian, born in Boston, Mass., and educated at Harvard and in Paris. He was instructor, lecturer, and professor of history at Harvard after 1915 and Harold Vyvyan Harmsworth professor of American history at the University of Oxford, 1922-25. He served as a private in the United States Army in the World War and was attached to the Russian division of the American Commission to Negotiate Peace in 1919. He was a member of many learned societies and wrote *Life of Harrison Gray Otis* (1913); *History of the Constitution of Massachusetts* (1917); *Maritime History of Massachusetts* (1921); *The Oxford History of the United States* (2 vols., 1928).

MORLEY, CHRISTOPHER (DARLINGTON) (1890-). An American editor and writer, born in Haverford, Pa. He graduated from Haverford College in 1910 and from that year to 1913 was a Rhodes scholar at Oxford. He served on the editorial staff of several publications and journals and from 1920 to 1924 conducted a column in the *New York Evening Post*. In the latter year, he joined the staff of the *Saturday Review of Literature*. Morley's critical insight and keen sense of humor have made him one of the most popular essay writers of the day. In 1928 he successfully undertook the production in Hoboken, N. J., of American plays of the middle nineteenth century. His books in prose and verse include *The Eighth Sin* (1912); *Songs for a Little House* (1917); *The Rocking Horse* (1919); *Parnassus on Wheels* (1919); *Travels in Philadelphia* (1920), *Pipefuls* (1920); *Tales from a Rolltop Desk* (1921); *Chimney-smoke* (1921); *Where the Blue Begins* (1922); *The Powder of Sympathy* (1923); *Inward Ho!* (1923); *Parson's Pleasure* (1923); *Thunder on the Left* (1925), *Hostages to Fortune* (1925); *The Romany Stain* (1926), *I Know a Secret* (1927); and *Essays* (1928).

MORLEY OF BLACKBURN (JOHN MORLEY), FIRST VISCOUNT (1838-1923). A British public official and man of letters (see Vol. XVI). From 1910 to 1914, he served as Lord President of the Council, but resigned in the latter year after the declaration of war with Germany, which he opposed. He retired to his country home and devoted himself to the writing of his *Recollections*, which was published in 1917. The book dealt very briefly with the end of his political life and was supplemented in 1928 by *A Memorandum on Resignation*, which was found among his papers. A complete edition of his works was brought out in 1921. Consult *Lord Morley's Criticism of English Poetry and Prose*, by J. D. McCallum (1921); *Lord Morley; Writer and Thinker*, by John H. Morgan (1924); and

Early Life and Letters of John Morley, by Francis W. Hirst (1927).

MORMONS. See LATTER-DAY SAINTS.

MORNINGSIDE COLLEGE. A coeducational institution at Sioux City, Iowa, founded in 1894. The student enrollment increased from 584 in 1913-14 to 1313 in 1927-28, and in addition, there was a summer-session enrollment in 1928 of 251. The faculty in the autumn of 1928 had 50 members. The productive funds of the college in 1928 amounted to \$800,000 and the income for 1927-28 to \$171,833. The library contained 30,475 volumes in 1928. Between the years 1914 and 1928, a chair of religious education, departments of economics and sociology, and a complete course in public-school music were established; and Main Hall, a conservatory, a gymnasium, a temporary science hall, and women's residence halls with a capacity of 200 and costing \$300,000, were constructed. President, Frank E. Mosman, A. M., D. D.

MOROCCO. The largest of the Barbary states, in northeastern Africa. Since 1912 about 95 per cent of its area has been a French protectorate; the rest, except for the free zone around Tangier, is under the protection of Spain. Total area, 218,525 square miles. The Spanish zone included 8280 square miles in the North. However, Spanish claims also took in the 9500 square miles in the Cape Juby region (southern zone) and the 580 square miles of Ifni on the west coast. By 1929 the French had occupied about 200,000 square miles. An official French census in 1926 gave the population for the French zone as totaling 4,229,146. The largest cities in the French zone, with populations for 1926, were: Casablanca, 106,608 (34,984 Europeans); Marrakesh, 149,263 (3052 Europeans); Fez, 81,172 (3559 Europeans); Rabat, 38,044 (1316 Europeans); Meknes, 29,930 (4923 Europeans). For the Spanish zone (northern), the population is estimated at 550,000, for Tangier, at 60,000 (13,000 Europeans). Tetuan, in the Spanish zone, has 24,000 inhabitants. Immigration, which had languished during the World War, became considerable again after 1918. See TANGIER CONTROVERSY.

Industry. Agricultural and pastoral pursuits occupy four-fifths of the native population. Of the 24,000,000 acres in the French zone capable of cultivation, only 6,000,000 acres are being tilled. Bailey and wheat receive the most attention; other crops are beans, oats, maize, and millet. Fruit trees, notably the olive, orange, lemon, palm, and almond, are beginning to play an important part. Stocks in 1926 in the French zone comprised 9,248,462 sheep, 3,037,731 goats, 1,932,840 cattle, 59,811 pigs, 562,835 asses, 190,251 horses and mules, 117,917 camels. Minerals include phosphates (1,337,100 tons produced in 1928), iron ore, copper, lead, petroleum, and manganese. Among the local industries are flour mills, breweries, soap and candle factories, cement factories, etc. The total number of European industrial establishments in 1926 was estimated at 600, employing 11,000 persons. As a result of European occupation, steady advances have been made. The construction of roads, harbors, and sanitary measures are the particular concern of the French. The harbor of Casablanca has received particular attention. The Spanish have concerned themselves with irrigation projects as well as the expansion of the port facilities of Ceuta and Larash.

Commerce and Communications. The trade of the French zone has increased regularly. In 1913 imports and exports were 181,426,000 and 40,180,000 francs, respectively; by 1927 they had increased to 1,798,597,755 and 851,390,141. The bulk of the foreign trade was with France. The chief exports in 1927 were barley, eggs, beans, linseed, wool, phosphates, live stock, and almonds. A total of 2,921,000 tons of shipping entered French Moroccan ports in 1912 and 2,421,088 tons in 1927. The trade of the Spanish zone was as follows: imports and exports for 1913 were 25,335,000 and 2,876,000 pesetas; for 1926, 123,000,000 and 18,000,000 pesetas. The trade for Tangier was as follows: imports and exports for 1913 were 24,455,000 and 3,408,000 francs; for 1927, 129,445,005 and 33,543,730. Under the French administration, road building has progressed rapidly so that by 1927, 2448 miles were open for use. As part of the same general plan for the opening up of the protectorate, military lines of 2-foot gauge were converted into standard gauge lines. There were 1100 miles of such roads in 1928. The principal lines were the Fez-Oudja (223 miles), Fez-Casablanca (210 miles), Casablanca-Marrakesh (171 miles). In the Spanish zone, a meter gauge line runs from Ceuta to Tetuan, and another from Rio Martin to Tetuan. Telephone and telegraph communications have been widely extended, and wireless stations were erected at Fez, Marrakesh, Mogador, and Tangier.

Government. In the French zone, as a result of increased activity, administrative costs mounted steadily. Expenditures in 1916-17 were 45,389,000 francs; in 1928, 641,232,265. Revenues are usually in excess with the result that the debt service carried annually was conspicuous. Of the 1928 budget, 140,717,893 francs were applied to the public debt, which in that year totaled 705,624,000 francs, of which 300,000,000 francs had been floated in 1922 as the first section of an authorized loan of 700,000,000 francs. No further sections of this loan have been floated. The scheme encompassed a great series of public works, including the development of harbors, roads, water-power resources, phosphate works, posts, telegraphs and telephones, health service, forestry, public instruction, etc. The budget for the Spanish zone in 1928 balanced at 55,913,441 pesetas. Education, under the foreign influence, has made great advances. In 1912 the French zone had only 37 schools; by 1926 it had 190 with 27,595 pupils in attendance.

History. The partial withdrawal of French troops on the outbreak of the World War, and the ever-present anti-European feeling which German agitators continually fostered, aggravated the unruliness long chronic in Morocco. As the War continued, French occupation was extended; the Tafilalet region was subdued by 1917, and an uprising of the Ait Atta there was put down, after desultory fighting, by 1919. France's policy of continuing public works and of befriending native chieftains stood her in good stead, for many of the powerful native leaders remained consistently friendly. In 1919 and 1920, as a result of trouble in the Sifru region and the Gharb, the French were able to push further into the interior, so that by 1923 most of the country, with the exception of the Middle Atlas, was effectively occupied. An exceptionally able administrator, Marshal Lyautey, was appointed to the post of Resident General for a second term on April 7,

1917, after a year's absence in Paris as Minister of War. Under his energetic direction, remarkable progress was made in sanitation, road construction, railway building, and education. Lack of success in dealing with the warlike Riff tribesmen, however, caused Lyautey's resignation in September, 1925. He was succeeded by Theodore Steeg, who, in turn, was replaced on Jan. 2, 1929, by Lucien Saint. Although the "Pearl of Northern Africa" prospered greatly under French rule, it was indebted to France, as a result of five loans, to the extent of 705,624,000 francs on Jan. 1, 1927.

The Spanish problem in Morocco was less easily solved. Because of the lax administration and the difficulties of communication, the native independent temper was less easy of subjugation. Bridandage continued the rule; the Riff and Jebala tribes were particular offenders. Most of the dissident spirits gathered around the old bandit chief, Raisuli. From 1916 to 1919, all attempts to eject him from the Tangier-Tetuan road which he held were unavailing; when he finally evacuated the country, he merely moved to another centre of operations.

By 1919, too, another leader, Abd-el-Krim, leading the Riff mountain tribes, appeared. In 1921 he inflicted a crushing defeat upon the Spanish troops at Melilla, capturing thousands of men and a hundred cannon. With the advent of 1923, the Spaniards were driven back to a narrow strip along the coast line. The influence of this succession of reverses on the situation at home was momentous. (See SPAIN.) In July, 1922, the Spanish High Commissioner General, Berenguer, was forced to resign; his successor, Gen. Ricardo Burguete, found it necessary to retire in December; and in September, 1923, because of the unsatisfactory handling of the whole situation, the Spanish government was seized in a *coup d'état* and a military dictatorship under General Rivera was created.

Rivera, however, was no more successful in dealing with the Moroccans than the old administration had been. Indeed, in 1925, it seemed as though Abd-el-Krim, after he had captured his rival, Raisuli, might make good his claim, established in 1922, to the title of Sultan of All Morocco. Unfortunately for Abd, he now ventured to attack the French who had tried to help the Spanish by cutting off the chieftain's grain supply. France sent in such modern weapons as airplanes and tanks, and by 1926 had a force of 150,000 men in the field. To these were added 104,000 Spanish soldiers—all against a total of from 65,000–75,000 badly-organized Riff tribesmen. After a series of reverses, some of Abd's allies deserted him, and on May 28, 1926, he surrendered. The French shipped him off into exile to the island of Réunion, near Madagascar, and then sent some official advisers into the recovered Spanish Morocco to help the Spanish High Commissioner straighten out things once more.

An area of 225 square miles around the Free City of Tangier was made an international neutral zone by a convention signed on Dec. 18, 1923, and a protocol signed in July, 1925, by Great Britain, France, and Spain. The international arrangement was somewhat modified by a Paris protocol of July 25, 1928. This latter protocol was also signed by Italy.

Theoretically, Sultan Sidi Mohammed, who succeeded his father, Moulay Youssef (reigned 1912–1927), to the throne on Nov. 18, 1927, became ruler over an absolute monarchy. Act-

ually, the various treaties and conventions in force gave all power to the French Resident General, the Spanish High Commissioner, the Administrator of the Tangier Zone, and a large group of French and Spanish local controllers. (See FRENCH COLONIES, SPAIN, TANGIER, WORLD WAR).

MORRIS, JAMES CRAIK (1870–). An American Protestant Episcopal bishop, born at Louisville, Ky., and educated at the University of the South, the Louisville Law School, and the General Theological Seminary. He was ordained in the Protestant Episcopal Church in 1896 and was the curate of churches in Texas and New York. From 1901 to 1916, he was dean of St. Mary's Cathedral in Memphis, Tenn., and from 1916 to 1919, rector of Grace Church in Madison, Wis. In 1920 he was consecrated Bishop of the Panama Canal Zone and Parts Adjacent.

MORRIS, ROBERT TUTTLE (1857–). An American surgeon, born in Seymour, Conn., and educated at Columbia University. He became a professor of surgery at the New York Postgraduate Medical School in 1895 and professor emeritus in 1917. He is the author of many books, including *How We Treat Wounds To-day* (1886); *Lectures on Appendicitis* (1895); *Dawn of the Fourth Era of Surgery* (1910); *Microbes and Men* (1918); *A Surgeon's Philosophy* (1918); *Doctors vs. Folks* (1918); *The Way Out of the War* (1918); *Nut-growing* (1921); and *Editorial Silence* (1927).

MORROW, DWIGHT WHITNEY (1873–). An American banker and diplomat, born at Huntington, W. Va., and educated at Amherst College and Columbia Law School. In 1899 he began the practice of law in New York City as a member of the firm of Simpson, Thatcher & Bartlett. In 1914–27 he was a member of the firm of J. P. Morgan & Co. He resigned on Sept. 30, 1927, to accept appointment as U. S. Ambassador to Mexico. As Ambassador, he was brilliantly successful in promoting friendly relations between the two countries. He took an active part in civic matters in New York City and in New Jersey. He was director of the War Savings Committee of New Jersey (1918). During the World War, he served with the Military Board of Allied Supply and received the Distinguished Service Medal. In 1925 he was chairman of the President's Aircraft Board.

MORROW, HONORÉ W. See WILLSIE, HONORÉ W.

MORTAR, TRENCH. See TRENCH WARFARE MATERIAL.

MORTGAGE BANKS. See AGRICULTURAL CREDIT.

MOSCICKI, IGNACY (1867–). A President of Poland, born at Mierzanov, then Russian territory. He was forced to leave Russia in 1892 because of his political activities and lived five years in London. In 1897 he became assistant and in 1901 director of the physical laboratory at the University of Fribourg, Switzerland, and in 1912 was appointed professor of physics at the University of Lemberg. He was elected President by the Diet in June, 1926, after Marshal Pilsudski, the dictator following a successful *coup d'état*, had refused election to the office and suggested Professor Moscicki for the post. See POLAND, under *History*.

MOSCOW, mós'kó. The capital of the Union of Soviet Socialist Republics (commonly called Soviet Russia) and of the Russian Soviet Federation. The population at the census of 1926

was 2,025,947; in 1929 it was estimated at 2,285,100. The population has increased more than 40 per cent since the revolution, making Moscow the largest city of the Soviet Union. The municipal area is 27.5 square miles. After the revolution, the city was divided anew into six sections which were named: Khamovniki, Krasnaya Presnya, Sokolniki, Baumansky, Rogozhsko-Simonovsky, and Zamoskvorechye. The development of Moscow since the revolution has changed the aspect of the city to that of a modern metropolis. Above the low government buildings, most of which were the former mansions of the aristocracy, and the hundreds of church cupolas rise Moscow's modern skyscrapers. The best example of the new type of architecture is the Moscow Trust for Agricultural Industry, a 12-story building erected in 1924.

With the transfer of the Soviet government to Moscow in 1918, it was natural that the Kremlin, around which the life of Moscow had revolved for more than 800 years, should be chosen as the seat of government. Within its walls the All-Russian Executive Committee, the Central Executive Committee of the Soviet Union, the Council of the People's Commissariats, and the Council for Labor and Defense of the Soviet Union hold their sessions. In front of the Kremlin, in the Red Square, stands the Lenin Mausoleum, a structure of black basalt in the vault of which lies the embalmed body of the leader of the Russian Revolution. During the revolution, the Red Square was the scene of many violent battles; about 500 revolutionists who fell during these skirmishes are buried, with other prominent communists, in the plot of ground called the Brothers' Graves between the Nikokhi and Spaski gates.

Opposite the citadel, where once stood the stone commercial booths of mediæval Moscow, are the Commercial Arcades. The first floor of the building is occupied by the colossal government department store known as the Governmental Universal Stores of the Supreme Council of National Economy. Along the western wall of the Kremlin extends the Alexander Garden in which stands a granite obelisk on which are engraved the names of the great revolutionary leaders. The obelisk was made from a Romanoff monument which commemorated some festal occasion. Most of the departments of the Government are housed in Ilyinka Street in the vicinity of the Kremlin. Among these are the People's Commissariat of Finance, the People's Commissariat for Commerce, the People's Commissariat of Home Affairs, the People's Commissariat of Workers' and Peasants' Inspection, and the Central Control Commission of the Communist Party. The Club of the Nobility has been converted into the House of the Labor Unions, and its ball room is used for the trade-union conferences of the Soviet Union.

Museums and Educational Institutions. One of the greatest changes wrought by the Soviet government was the change in the status of the Russian Orthodox Church, which was shorn of its wealth, deprived of State support, and reduced to the position of a voluntary, unprivileged, and self-supporting society. Several of Moscow's famous churches and monasteries, such as the Church of Michael Malein in the Kremlin, the Cathedral of St. Basil in the Red Square, the Church of the Georgian Virgin, the Simonov Monastery, and the Novodievichi Nunnery, have been transformed into museums. The Chapel of

the Iberian Virgin was torn down in 1929 to widen the main gate of the Red Square, and the famous icon, the jewel-encrusted portrait of the Madonna, was removed to one of Moscow's churches. Since 1922 the most important art treasures taken from the churches and monasteries during the revolution and nationalized at that time have been kept in the Oruzheynaya Palace within the Kremlin. The inscription on the wall of the Second House of the Moscow Soviet, "Religion is opium for the people," proclaims the sentiment of a state which has adopted the precepts of Karl Marx.

The Moscow Soviet has kept abreast of Leningrad in the establishment of museums. The State Russian Historical Museum, facing the Red Square, was reorganized in 1921 into the Historical and Ethnological Museum of the Peoples of the Soviet Union and embodies the Department of Antiquities, formerly housed in the Rumyantzeff Museum. The Court of Finance has been converted into the Central Museum of the Red Army and Navy, with an especially interesting exhibit dealing with the period of the revolution. The Museum of the Revolution, founded in 1924 and housed in the former palace of the Razumovskis, presents the history of the Communist Party and of the Russian revolutionary movement. The picturesque estate of Pokrovskaye-Streshnyevo was changed in 1919 into a museum of the life of the nobility during the period of decadence. The Museum of the Lenin Institute, founded in 1924, contains objects relating to the life and work of Lenin. The Museum for the Promotion of Art, founded in 1923, contains examples of cubism, futurism, constructivism, and other schools of modern Russian art. The Central Museum for the Protection of Labor and Social Insurance, under the control of the People's Commissariat for Labor, affords an excellent means of visual education on methods of industrial hygiene and labor protection. The State Bakhrushin Theatre Museum contains a large collection of objects connected with the history of the Russian stage. The State Toy Museum, founded in 1918, illustrates the many aspects of the influence of toys on a child's development. The Museum of the Central Industrial Region, organized in 1923, depicts the ethnography, geology, and archaeology of the region about Moscow. The Rumyantzeff Museum, the finest architectural structure of the eighteenth century in Moscow, has been converted into the Lenin State Public Library with a collection of more than 3,000,000 volumes.

The Soviet government points with pride to its educational record. Before the World War, when Moscow had a population of 1,600,000, the children receiving an education numbered 295,000; in 1926 when the population numbered 2,025,000, 430,000 children were attending the public schools. A total of 900,000 persons in 1926 attended the public schools, technical schools, higher educational institutions, and the various "stations" for the elimination of illiteracy. Under the Soviet régime, more than 200,000 adults have learned to read and write. During the fiscal year 1925-26, the Moscow Soviet expended 37,000,000 rubles for public education. Among the important educational institutions established under the Soviet régime are the Marx-Engels Institute, founded in 1921 for the purpose of scientific research into the origin, development, and extension of the theory and practice of socialism and revolutionary communism;

the Communist Academy, with which are associated the Institute for Soviet Upbuilding and the Institute for World Economy and World Politics; the Institute of the Red Professorship, whose function is the training of Marxist teachers for the higher schools; the Children's City—Third International, an experimental station for the communistic education of children; the Experimental Station for Social Upbringing, whose object is the investigation of educational processes and the adoption of new school systems; the Central Workers' Institute, established for the experimental study of production processes and the training of workers in different trades; and the Academy of Fine Arts, founded in 1917 for the purpose of scientific research into the nature of art and artistic culture.

Industrial and Municipal Development.

Moscow, next to Leningrad, is the greatest centre of trade and industry of Soviet Russia. Of the entire trade turnover of the country, 23 per cent falls to the share of the Province of Moscow. The gross output of the industry of the Moscow Province, 97.7 per cent of which is socialized, is likewise a high percentage of that of the entire country. During 1928 the sum of 370,000,000 rubles was expended on the capital development of Moscow's industries. The textile, foodstuffs, leather, and metal industries are being chiefly developed. In 1927 and 1928, the industrial output of Moscow increased 51 per cent and labor efficiency 35 per cent. In 1920, 25 per cent of all Moscow workers were placed on a seven-hour working-day basis.

The health measures instituted by the Moscow Soviet are having a beneficial effect. During the fiscal year 1926-27, the Moscow Soviet spent 46,000,000 rubles for health protection. the number of dispensaries was increased 19 per cent and the number of hospitals 12 per cent. In 1913 the death rate amounted to 25 out of every 1000; in 1928 it fell to 13 out of every 1000. Moreover, of the 49,860 babies born during 1928, only 6400 died, whereas in 1924 out of 54,300 babies 16,000 died during their first year. This decline in mortality is largely the result of the exhibits sponsored by the People's Commissariat for Health, such as the Exhibition of Health Preservation of the State Institute of Social Hygiene and the Exhibition of the Protection of Maternity and Infancy. The death rate was expected to decline still further as the Moscow Soviet continued to improve the sewer system, enlarge the park space, and increase housing facilities.

Considerable improvements have been made in the city's water-supply system, about 85 kilometers (52.8 miles) of new water mains having been laid since 1920. In 1927 and 1928, 140,000,000 rubles were expended for housing construction, the total floor space of the new dwellings, 880,000 square meters (9,472,000 square feet), accommodated 150,000 persons. In 1929 plans were made for the construction of a subway, 5 kilometers (3.1 miles) long, between the Sverdlov Square in the centre of the city and the Kalanchev Square on which the "October" and other railway stations are located. Another line, 12 kilometers (7.4 miles) in length, was to connect the Sokolniki section with the Krasnaya Presnya and Khamovniki sections.

Moscow has retained its title of Russia's cultural centre. The Great Academic Theatre and the Moscow Art Theatre have flourished under the Soviet régime, the leaders, even during the

darkest days which followed the revolution, encouraging dramatic art, maintaining the ballet, and giving recognition to all distinguished actors, dancers, and musicians, provided that they were loyal to the Soviet State.

MOSELEY, GEORGE VAN HORN (1874-). An American soldier, born in Evanston, Ill. He graduated from the United States Military Academy in 1889, was commissioned second lieutenant in the cavalry, and rose to the rank of brigadier general in 1921. He was appointed chief of the 4th Section of the General Staff at General Headquarters in 1918 and had general charge of the strategic supply, transportation, construction, and evacuation of the American Army in France. He was a member of several important commissions, including the Harbord Commission to the Near East, and was assigned as assistant to General Dawes in the U. S. Bureau of the Budget in 1921. In 1925-27 he commanded the 11th Field Artillery Brigade in Hawaii. He was awarded the Distinguished Service Medal and was given decorations by the Belgian, British, French, and Italian governments.

MOSES, GEORGE HIGGINS (1869-). A United States Senator. He was born at Lubec, Me., and was graduated from Phillips Exeter Academy (1887) and Dartmouth College (1890). From 1892 to 1918, he was editor of the Concord (N. H.) *Evening Monitor*. As private secretary of two New Hampshire governors and the chairman of the Republican State Committee, he had an early introduction to practical politics. In the Republican National Conventions of 1908 and 1916, he served as delegate-at-large from New Hampshire. He was Minister to Greece from 1909 to 1912. In 1918 he was elected to the United States Senate for an unexpired term and was reelected for the terms 1921-33. He was made president *pro tempore* of the Senate in 1925 and has been chairman of the Rules Committee and a member of the Foreign Relations Committee. He was permanent chairman of the Republican National Convention at Kansas City in 1928.

MOTHERS' PENSIONS. Mothers'-pension laws, or laws providing for public aid to dependent children in their own homes, are intended to conserve family life by preventing the break-up of homes after the death, desertion, or disability of the father. The first State-wide mothers'-aid law was passed in 1911, two years after the White House Conference on the Care of Dependent Children, called by President Roosevelt, had declared as its fundamental proposition that children should not be deprived of home care except for urgent and compelling reasons, and that "children of parents of worthy character . . . and children of reasonably efficient and deserving mothers who are without the support of the normal breadwinner, should, as a rule, be kept with their parents, such aid being given as may be necessary to maintain suitable homes for the rearing of children." The mothers'-pension movement became an effective answer to the arguments of opponents of child-labor legislation that children of widowed mothers would be helpless if they were not permitted to work. By the close of 1913, 19 States had State-wide mothers'-pension or aid-to-mothers laws, and Missouri had provided for such aid in Kansas City and St. Louis. By 1928 such laws were in effect in the District of Co-

lumbia, Alaska, Hawaii, and all the States of the Union except the following: Alabama, Georgia, New Mexico, and South Carolina.

At first, the aid was usually limited to widows, but the conception of this method of provision for children has gradually widened, until by 1928 only five States, of the 44 in which laws were in operation, limited the grant to children of widows, though all the States included widows directly or by implication. The Colorado act included a parent, or other person designated by the court, who because of poverty was unable to provide properly for a dependent child. Children of widowed or deserted mothers, and of mothers whose husbands were serving penitentiary sentences or were physically or mentally incapacitated, were commonly included. The ages under which children were eligible for aid ranged from 14 to 17 years and one State (Ohio) mentioned no age limit; in many States, the upper age limit had been made to correspond with the upper age limit of the child-labor law, so that aid might be continued until the child was legally permitted to go to work. In the majority of States, maximum amounts were specified, ranging from \$8.66 to \$35 a month for one child, with additional amounts (usually smaller) for each additional child. Frequently, the maximum amount for a family of any size was specified in sums ranging from \$40 to \$70, but in six States there was no such limitation. The amount of aid granted to each family can be adjusted to the actual needs of the family only if the maximum amount authorized by law is sufficiently high or if no limit is specified. The administration of the aid-to-mothers law was vested either in a court having juvenile jurisdiction, a county or town board granting poor relief, a county board of public welfare, a special county board, or a State board. Ten States and the District of Columbia require that mothers receiving pensions be citizens or have made a declaration of intention; in 39 States, there is a requirement calling for a period of residence in the State.

How important has become this public aid to dependent children may be gauged from the following figures. During 1928, New York State was spending \$6,396,307 on its dependent families, which numbered 12,538. In the same year, New York City was spending \$5,156,436 to care for 9907 families with 26,096 children. The Children's Bureau estimated that, at any one date, approximately 200,000 children were receiving this form of public aid in their own homes. In 20 States, the sum of \$18,000,000 was being spent annually. It is not unreasonable to expect that before long these public agencies will take care of all dependent children and make the work of private philanthropy an anachronism.

MOTOR VEHICLES. In recent years, motor vehicles have undergone very little change in basic principles and design. Many improvements, however, have been made in the way of mechanical details and in the case of passenger cars, in refinements of body lines, finish, and equipment. Each succeeding year's models of passenger cars show that style is becoming more

and more a factor as affecting appearance; the resemblance between different makes became strikingly evident in the 1929 models. Outstanding changes since 1919 have been the introduction and complete adoption of so-called balloon or low-pressure tires and four-wheel brakes. Systems of finishing cars also have entirely changed with a great gain in resistance to deterioration. The nitrocellulose, or lacquer, system has superseded the old oil-base paint-and-varnish system, and chromium has now replaced nickel for the plated parts.

Power plant accessories that were innovations in this period were gasoline strainers, air cleaners, and oil filters, all having their effect in reducing or retarding wear of moving parts by removing dust, grit, and foreign particles from the gasoline and air entering the cylinders in the combustible mixture, and from the lubricant between its cycles of circulation, the latter making less frequent changes of crank-case oil necessary.

Speaking generally, engineering talent, since substantially satisfactory reliability and endurance already were achieved, has been directed toward greater comfort and convenience for driver and passengers. Faster, comfortable riding, and longer driving without fatigue are now possible through better springing, the now nearly universal use of some form of shock absorbers, better weight distribution, improved form, tilt, and cushioning of seats, careful selection of tire sizes and pressures, and reduction of vibration, not only from without, as by the means just noted, but also from within through rubber insulators in engine and other mountings, better engine counterbalance, vibration dampeners, lighter reciprocating parts and quieter gearing. The driver has had his convenience considered in easier gear shifting, simplified chassis lubrication, quicker pick-up through more power, and less tiring steering and braking mechanisms.

Of the three sources of motive power—steam, electricity, and gasoline—the last has increased in use while the others waned until the internal-combustion engine was practically the sole survivor.

Steam Automobiles. Steam automobiles are rapidly passing out of use in the United States, where their application has been mostly for passenger use; but they are still used to some extent in England for commercial purposes. Several marked improvements were made in the steam automobiles, overcoming some of the objections against them. One of these was the frequent refilling of the water-supply tank, which in the earlier Stanley steamers was necessary every 25 or 30 miles. This was because the steam was exhausted directly into the air after it had passed through the engine. The later steam automobile exhausts into a condenser at the front of the chassis where the radiator is placed in gasoline vehicles. The steam condenses, the cylinder oil is separated from it, and the water is pumped back into the tank and used repeatedly, but must be replenished for loss exhausted to the air through a relief valve when steam is used in excess of the condenser capacity as on heavy pulls. The cruising radius on one tank of water is increased from 6 to 10 times that possible without the condenser.

The other big improvement was the Doble combustion system, in which the usual Bunsen or Argand burner is replaced by a more intense blow torch or blast flame that burns in a closed

COMMERCIAL VEHICLES

The middle-priced group are all at least six- and some of them eight-cylinder and nearly all of the higher priced cars have either V or straight eight engines.

The gain in eight-cylinder popularity for passenger cars is the significant development of the past decade. Even more striking is the increased use of six cylinders in the commercial car field. Of 529 models in 1919, 97.9 per cent were four-cylinder, 1.7 per cent were six-cylinder, and only 0.4 per cent were still two-cylinder. Of 845 models in 1929, 52.7 per cent are four-cylinder; 47 per cent, six-cylinder; and 0.3 per cent, eight-cylinder engines. In the light and medium-weight trucks, the sixes predominate but fall off in the heavier trucks to make the average as just given.

There has been a considerable trend toward the provision of more power in the engine in proportion to the weight of car to be moved. Four-wheel brakes furnishing ability to stop quicker have made higher speeds safe, and laws in many States have been modified, increasing the maximum allowable speed, particularly in the open country. Authorities indeed are becoming as much concerned over the slow driver as they formerly were over the speeder, for they have the problem of increasing the capacity of their roads and it is expensive to build more roads or widen old ones, so they are striving to move traffic faster. Even car owners who are not interested in speed like more power for hills to save gear shifting, and for quick get-away after traffic stops.

The increased engine power generally has been provided not so much through larger cylinder diameters or increased piston displacement as by higher compression and higher speeds. Lightening of the reciprocating parts and more accurate balancing of crankshafts have made higher speeds possible without excessive vibration. Aluminium is being more used for pistons in place of cast iron, since the difficulty of its greater coefficient of expansion has been overcome by use of split skirts and other improvements in design that avoid the former necessity of excessive clearance with consequent piston slap when the engine is cold. Connecting rods also are being made lighter but equally strong by the use of alloys. Higher speeds called for more effective lubrication and the old splash system of distributing oil to the cylinder walls and crank and connecting-rod bearings has given place almost completely to the pressure or positive-force feed system. Higher speeds also have brought changes in valve design and operation. For the quicker admission and exhaust of the cylinder charge, the valve areas and lifts have had to be increased and mechanism devised to move them quietly, so that much study has been given to cam contours, rocker arms, roller lift tappets, etc. Finally, with complete enclosure of all moving parts, engines, even of the poppet type, are now remarkably silent.

Knight and other sleeve-valve engines are inherently less noisy and have other advantages that have led many to investigate these types; but, thus far, they have not pushed the poppet type into the discard. European manufacturers are doing more with sleeve-valve engines, but in the United States there remain today only two makes of cars so equipped. For a time, there was prospect of interest in an imported single-sleeve design somewhat simpler and cheaper to manufacture than the Knight double-

sleeve valve, but no stock car has yet adopted it. Another object of attack in quieting engines has been the power transmission from the main shaft to the camshaft and to the electric generator, ignition distributor, and water- and oil-circulating pumps. Honors are still about evenly divided between gear trains with angular or helical teeth and a composition intermediate gear, and chain drives of the silent-link type.

Always in internal-combustion engines there is more heat generated than can be converted into power and it is necessary to carry away the excess heat to keep the temperature down to that which will not cause preignition of the combustible mixture nor injure the metal of cylinders, pistons, and valves. Cooling by a circulation of water in jackets surrounding the cylinders and valves is the prevailing practice. On aviation and motor-cycle engines, air cooling is universal because of the saving in weight, and there have been several motor vehicles built having this type of cooling; but today the Franklin car is the only one still using an air-cooled engine. This has a blower driven by the crankshaft which circulates air through chambers that pass it around the cylinders which have cast ribs or vanes to increase the cooling surface. Against the disadvantage of a little bulkier and more complicated construction are the advantages of freedom of trouble from freezing of water in winter or boiling away of the water under the high temperatures created by heavy loads in hot weather.

Chassis Design. Front-wheel drive is looming as possibly the next real development in chassis design. Two American makers in 1929 placed stock models on the market, while certain prominent European automobile makers are reported to be secretly at work on front-wheel drives. This type of drive is not new, having been used on a few trucks and some racing cars for several years, one of the latter taking second place in the Indianapolis race in 1925. There are unquestioned advantages in pulling instead of pushing the car, such as facility in lifting out of holes or soft ground, less tendency to skid, ability to build lower bodies when there is no long propeller shaft beneath it and the rear axle does not have to accommodate the differential, and improved riding qualities with less unsprung weight. With front-wheel drive, the differential mechanism would be carried above the springs. Removing all of the power-transmitting mechanism from under the car to a location of easier access under the hood would be a boon to the repairman.

The great disadvantage of front-wheel drive is the mechanical complication of driving the wheels that do the steering. It would, however, somewhat simplify front-wheel braking, as the drums could be removed from the front wheels to the transmission, further reducing unsprung weight, for the jointed transmission shafts could transmit both the driving and retarding efforts.

Some of the mechanical details of front drives have been worked out in connection with four-wheel-drive trucks, but passenger cars introduce special problems. The already rather long front hoods covering the power plants of some sixes and most eights would be aggravated by the increased length required in putting the transmission and differential ahead of the engine, so that four-cylinder or V eights would have some advantage for the front-drive application.

It is not safe to predict anything regarding future developments in the automobile field, there have already been so many unexpected happenings; but at least it would not be surprising if considerable attention is turned to front-wheel driving in the near future.

Chassis Suspension and Lubrication. A great deal of attention has been given in the last few years to securing easier riding and maintaining it with greater convenience. Springs are better, generally longer and made up of more and thinner leaves for greater flexibility. Proper ratios of front to rear springs prevent rocking-horse effects, and shock absorbers check rebounds and some dampen the motion in either direction. Mounted on balloon tires, cars now ride with comfort unknown 10 years ago and perform on fairly poor roads with little distress compared to that which was experienced when high-pressure tires were standard.

At that time, there was only one way of connecting frames and springs—by metallic shackles and bolts, and lubrication was by compression grease cups, the filling of which was such an irksome, dirty job that it was usually neglected. Owners preferred to pay for replacing worn out bolts rather than to give them the lubrication that would prolong their life. An oil can seldom found its way around a car until a squeak became unbearably annoying. Many ways were tried to overcome or mitigate the nuisance of chassis lubrication. In the direction of its complete elimination, there have been introduced a variety of substitutes for the mechanical metal-to-metal shackle, including flexible hinges of fabric and rubber, rubber cushions or blocks in which the ends of the springs are imbedded, and ball-bearing shackles. Simplifying chassis lubrication has been the effort of others who have developed nipples for the quick attachment of high-pressure grease guns and even complete systems of piping for delivering oil under pressure from a central reservoir to the individual lubrication points through metering connections that will pass just the amount required.

According to the number of models (not number of cars) produced in 1929, metal shackles were on 71.2 per cent; rubber on 14.9 per cent; fabric on 6.4 per cent; and ball-bearing shackles on 7.5 per cent. As to methods of lubrication, pressure-gun systems are on 76.9 per cent and central-reservoir systems on 23.1 per cent. All other methods of lubrication have been discontinued. Naturally, metal shackles are used with all of the central oiling systems, but some having pressure-gun lubrication for other points have shackles that do not require lubrication.

Improved Fuel. One of the most important accomplishments of the past decade and one of immeasurable benefit to the automotive industry has been the improvement in fuels for internal-combustion engines. Gasoline had been getting steadily worse in quality because of the necessity, in meeting the increased demand, of getting more out of the crude petroleum and so including more of the less volatile content in commercial gasoline. For a time, the oil producers were seemingly helpless to improve the quality and automobile-engine designers were driven to design their engines for the best use of the poorer fuel.

It became the feeling that closer coöperation between the two interests might be helpful, that is, if each could know more exactly the difficulties of the other. Independent investigations

had been going on for some time by both sides, but there was little interchange of data. Early in 1921, the U. S. Bureau of Standards became interested and offered its facilities to help if the expense could be shared, as its appropriation did not allow a great deal of research for an individual industry. Associations concerned were brought together and an agreement was reached whereby the American Petroleum Institute and the National Automobile Chamber of Commerce would jointly finance a study by the Bureau of Standards under the direction of a steering committee made up of engineers and chemists from the oil refiners to represent the A. P. I. and from the Society of Automotive Engineers to represent the N. A. C. C.

The work started with the purpose of determining how to make the best use of the fuel then available. Possibly the joint research was a stimulus to refinery advances, but mainly responsible for the improvement of fuel in the past few years was the necessity of securing a greater yield from the crude production to meet the demand for gasoline. The way was found through the more general application of cracking processes. The result has been not only an increased yield but gasoline of higher volatility and less tendency to knock, so that engines could be given higher compression ratios with resulting increase in economy.

As the better fuels became available, the programme of the Coöperative Fuel Research has kept pace and in the seven years that it has been in progress, there has been developed a fund of information that has had much to do with the present greatly improved car performance, as shown by more power, quicker acceleration, easier starting, and better economy. Meanwhile, independent work was not stopped; on the contrary it was decidedly accelerated, for the individual oil refiners and engine manufacturers added very materially to their own laboratories and technical staffs and contributed greatly to the progress recorded in the past 10 years in the internal-combustion-power field.

In the search for anti-knock fuels permitting higher compression engines, many turned their attention to the possibilities through compounding fuels, or treating them with chemicals of different kinds. Benzol blends became very popular, but benzol is not available in quantity sufficient to treat all of the gasoline required and can never be the sole remedy, for nearly half the mixture must be benzol to eliminate knocking. In the line of fuel treatment, the event was the development by the General Motors Research Corporation of ethyl gasoline. The adding of one-tenth of 1 per cent of tetraethyllead will convert quite ordinary gasoline into a very good anti-knock fuel and many companies secured the rights and are selling gasolines so treated quite extensively. The sale would have been much larger if the better standard grades of cracked gasolines had not come into the market before ethyl gasoline came into general use.

Starting, Lighting, and Ignition Systems. The internal-combustion engine is not self-starting and to do away with the necessity of hand cranking various devices were introduced. In general, they were of four types: (a) mechanical, involving a spring that could be wound with little exertion when run down and would wind itself after the first start; (b) pneumatic, moving the pistons by compressed air stored between stops; (c) gas, exploding a combustible mixture

over the piston that was in starting position; and (d) electric, operated by current from a storage battery recharged while the engine is running. By 1919 all other starting systems had been abandoned in favor of the electric which were of two kinds—the single-unit and two-unit systems—the difference being that in the first the starting motor and generator are in one frame with a single rotor, while the second has separate machines for each. The single-unit system is somewhat simpler, but costs more to repair when windings burn out or suffer injury, and gradually the two-unit system has become the prevailing type.

In general, there are two ways of engaging the pinion of the starting motor with the gear teeth on the flywheel. The older way, still used on about a third of the passenger-car models built, is to shift the pinion laterally on its splined shaft until it engages the flywheel teeth, by a fork that is connected with the same lever that actuates the starting motor switch. After the engine starts, an overrunning clutch allows the pinion to run free on the starting motor shaft, so that the motor cannot be driven by the engine, otherwise, the motor might be injured by excessive speed and it would be difficult to disengage the pinion. As it is, the pin-

teeth. All that the operator has to do to start the car is to close the switch controlling the current to the starting motor and release it when the car starts.

Ten years ago, starters were rarely provided on commercial vehicles, except those of the lighter or delivery type, generally mounted on passenger-car chassis. Now, the exceptions are the other way. All busses and all light- and medium-weight trucks have starters and only a few heavier types are still cranked by hand.

Electric lighting preceded electric starting, in fact gave the electric system its main advantage, for one battery could be used for both and, with the generator added to charge the battery, it was no longer necessary to remove the lighting battery for charging. The lighting also practically determined the voltage used, for 6 volts had been adopted because of the sturdier filaments in the lamps, better resisting breakage from vibration. So, in general, electric starting systems were designed for the same voltage. There were however, in 1919, seven makes of passenger cars that used a 12-volt system and one a 24-volt system. Today, the 6-volt system is universal except on busses where the greater demand for interior lighting makes a higher voltage system desirable.

TYPICAL ONE-WIRE STARTING AND LIGHTING SYSTEM

ion is easily retracted from the flywheel teeth when the starting lever is released.

The other and more commonly used mechanism is known as the Bendix drive and is entirely automatic in its engagement and disengagement of the pinion with the flywheel gear. The bore of the pinion is threaded to fit a corresponding screw thread on the starting motor shaft and the pinion is eccentrically weighted so that inertia keeps the pinion from rotating with the first few revolutions of its shaft. This moves the pinion laterally until it finds its way into the flywheel teeth and when fully engaged it reaches the limit of its axial movement and is forced to rotate with its shaft, driving the flywheel. When the engine starts, it takes on a speed faster than that at which the starter would drive it and this reverses the pinion travel on its thread and spins it out of contact with the flywheel

teeth. With the adoption of electric starting and lighting, the use of magnetos for ignition gave way practically entirely to the single-coil-distributor battery system. Some European makers still retain the magneto from a conviction of its greater reliability, but improvement of the battery system has removed objection to it from that consideration. Trucks that are not electrically started still generally use magnetos.

Some makers use two spark plugs to a cylinder and double distributors, not so much for greater dependability as to secure quicker burning of the mixture and somewhat improved engine performance, but single systems are the rule. Ignition troubles are comparatively infrequent now, particularly as spark plugs are made of better materials and last longer under their trying service.

Generators. The generator also has been greatly simplified. The most popular forms employ the third-brush system of current-output regulation instead of the centrifugal governors, slip clutches, separate resistance, etc., of the older systems. A simple form of automatic current cut-out prevents the battery from discharging back through the generator when it is not turning fast enough to generate charging current. The single-wire system is also a step forward in simplifying the layout. Instead of using two wires for each circuit, only one insulated wire is used; the metal frame of the

GENERATOR AND STARTING MOTOR USED ON SOME MODELS OF CHEVROLET AUTOMOBILES

The upper figure shows the generator, which has important components of ignition system, such as induction coil and timer distributor, mounted thereon. Below is the starting motor, having the Bendix automatic starting pinion shift. When the motor is started by the switch, the armature rotation automatically engages pinion with gear teeth cut on fly-wheel.

car is used for a return or ground, and one pole of each appliance, such as lamp bulbs, horn, etc., is grounded to the frame or some metal part in good electrical contact with it. The wire is carried in a metal sheath to prevent chafing the insulation, and precaution taken to make all connections so that short circuits are unlikely. In general, separate starting motors and generators are used, but the one-unit system, in which a single motor-generator suffices, also is popular. Two commutators are provided on the armature shaft, one of these is used when the machine is used as a starting motor, and the other commutator and set of brushes come into action automatically when the engine has started and is running fast enough to turn the armature shaft by an automatic driving clutch.

Carburetors. The principal improvements in carburetors during the period under consideration have been in the direction of making them

smaller and simpler, with fewer moving parts. The earlier carburetors had to be adjusted with every change of fuel used or of atmospheric temperature. Most carburetors now will take almost any commercial grade of gasoline, summer or winter, and function automatically with very satisfactory efficiency. The parts must be selected and proportioned according to the car or engine with which the carburetor is to be used. This combination, determined at the factory, constitutes the "factory setting" and no further adjustments are required with most modern carburetors. Any disorder is therefore generally due to the presence of dirt or water and a simple cleaning restores the functioning. Most carburetors are now particularly easy to clean. Even such troubles, however, are rare, for gasoline strainers are usually provided today that keep grit and water from reaching the carburetor.

More attention is being given to manifold design and preheating of the fuel mixture as means to better utilization of the gasoline. Poor manifolding can destroy much of the advantage of the best carburetor, whereas, a properly designed and heated manifold may overcome the defects of an indifferent carburetor. In the latest designs, intake and exhaust manifolds are located so that heat from the exhaust gases will be used to help vaporize the mixture on its way to the cylinders. Others have so-called "hot spots" in the intake riser from the carburetor. Thus, after an engine is warmed up, there is little possibility of raw or unvaporized gasoline finding its way into the engine.

There are other devices that accomplish the same result for a cold engine, making far easier starting in winter. Such are the Packard fuelizer, the Lincoln electric-fog generator, and the Franklin electric-heating arrangement. All are in the nature of carburetor accessories to produce a warm gasoline mist that will easily ignite, even in zero weather, and thus prevent running down the battery and diluting the crankcase oil by liquid gasoline drawn in when priming and choking devices are resorted to for quicker starting.

THE ZENITH CARBURETOR
This fuel-vaporizing device gives automatic mixture compensation without air valves

Fuel Supply. The original method of feeding gasoline to the carburetors directly by gravity from the main supply tank, usually located under the seat or cowl, has been abandoned on all passenger cars except the Ford, including the new Model A, but still continues to be used on about a third of the motor-truck models. For convenience and safety, the preferred location of the main fuel supply tank is at the rear of the vehicle, from which location it cannot be delivered to the carburetor by gravity. For a time, there was considerable use of the pressure system, the gasoline being forced by air pressure introduced above its surface in the tank to flow through piping to the carburetor. One trouble with this system was difficulty in keeping it tight. Pressure was usually lost while the car was idle and it was necessary to pump it up by hand before the car could be started. Thereafter, pressure was maintained automatically while the car was running.

Under these conditions, every oscillation of the rocker shaft produces a stroke of the pump, but as soon as the supply of fuel exceeds the demand, as when the carburetor needle valve is seated shutting off the inflow of gasoline, pressure builds up above the diaphragm holding its spring compressed and the rocker arm oscillates idly, bending the toggle links without moving the diaphragm.

Of the passenger-car models built in 1919, 86.2 per cent had vacuum fuel-feed systems; 7.9 per cent, gravity systems; and 5.9 per cent, pressure systems. Of the 1929 models, 59.8 per cent have vacuum feeds; 34.7 per cent, mechanical pump feed; 3.3 per cent, pressure feed; 1.1 per cent, gravity feed; and 1.1 per cent, electric-pump feed. For motor trucks, the figures were quite different. In 1919, 78.8 per cent of the models then built had gravity feed; 19.4 per cent, vacuum feed; and 1.8 per cent, pressure feed. The 1929 motor trucks had vacuum feed on 70.3 per cent

THE A. C. FUEL SUPPLY SYSTEM

A mechanically operated diaphragm pump, driven from any moving part of the engine, inserted in the fuel supply line to deliver gasoline from the main supply tank to the carburetor.

- | | |
|--|---|
| A, Flexible diaphragm | K, Strainer. |
| B, Metal disks clamping diaphragm | L, Suction valve. |
| C, Coiled spring tending to keep diaphragm in upper position. | M, Pump chamber. |
| D, Rocker arm pivoted at E and, through links F, capable of pulling pump diaphragm down but not of pushing it up | N, Discharge valve |
| G, Revolving shaft carrying an eccentric H to oscillate the rocker arm | O, Outlet to carburetor |
| J, Gasoline inlet | P, Spring holding rocker arm in contact with driving eccentric. |

This system soon gave place to the vacuum system making use of an intermediate small tank on the engine side of the dash which is filled by suction obtained from the engine manifold and discharges by gravity to the carburetor. The vacuum tank is actually two tanks, one within the other. The inner one through float-actuated mechanism alternately fills and discharges to the outer tank, so that the latter furnishes continuous supply to the carburetor. The system is very simple, subject to little trouble, and is the most common in use today on both passenger and commercial vehicles.

Newer systems accomplish the transfer of gasoline from the rear supply tank to the carburetor through mechanical or electric pumping devices. Typical of these is the fuel-supply system which makes use of a mechanically operated diaphragm pump driven through a rocker arm by an eccentric on the camshaft. The other end of the rocker shaft is connected by toggle links to the diaphragm plunger rod which is normally held at the upper end of its stroke by a coiled spring.

of the models, gravity feed on 25.7 per cent, pressure feed on 2 per cent, mechanical-pump feed on 1.3 per cent, and electric-pump feed on 0.7 per cent

In the early days of motor busses, they were generally mounted on motor-truck chassis with but slight modification. Now, motor busses are a class by themselves, with their chassis generally specially designed for that service, so that it is

TYPICAL MODERN FUEL-SUPPLY SYSTEM

A vacuum tank is interposed between main fuel container and carbureting device

and the only variable was the type of tooth—straight or spiral, with the preponderance of use in favor of spiral bevel, because of its greater quietness. Of the models built in that year, 86.2 per cent had spiral bevel and 13.8 per cent, straight bevel gear final drives. Motor trucks, in the same year, had their final drives divided as follows: Worm, 86.5 per cent; internal gear, 18.8 per cent; chain, 8.8 per cent; straight bevel, 4.1 per cent; spiral bevel, 0.8 per cent; double reduction, 0.8 per cent, and external gear, 0.2 per cent. In the meantime, for passenger-cars, we have seen a little renewed interest in worm drive and the development of a modified spiral bevel gear known as a hypoid gear, in which the axis of the pinion is offset to one side and does not intersect the axis of the gear. The tooth action is a little smoother than for the ordinary spiral bevel, combining both rolling and sliding contact. The 1929 passenger-car models included no cars with straight-toothed bevel gears. The percentages of the various types of final drive were as follows: Spiral bevel, 88.5 per cent; hypoid, 6.3 per cent; and worm, 5.2 per cent. Notice also the changes in motor-truck practice, for, of the 1929 models, 45.6 per cent had worm drive; 10 per cent, double reduction gears, 15.1 per cent, spiral bevel; 14.3 per cent, straight bevel; 4.2 per cent, chain drive, and only 1.8 per cent are still using the once quite popular internal gear drive. Most of the straight and spiral bevel drives are on the lighter capacity trucks or delivery cars, which follow more closely passenger-car practice, and the worm and double reduction drives are on heavier trucks and chain drives on the heaviest.

Modern motor busses show a considerable variety in the final drive. Of the 1929 models, 37.1 per cent have worm drive; 25.8 per cent, double reduction; 24.8 per cent, spiral bevel; 6.7 per cent, straight bevel; 4.5 per cent, internal gear; and 1.1 per cent, front-axle drive, this again being the Uppercu coach.

Brakes. Of all the improvements made in automobiles in the past decade, probably none had so much influence on motor-transportation practice and driving habits as the addition of brakes to the front wheels. Four-wheel brakes so greatly increased the stopping ability that it at once became safe to drive much faster than formerly and the result has been that as the use of cars so equipped has become nearly universal, States and municipalities have raised their former maximum speed limits. This has done much to relieve traffic congestion and to increase the capacity of existing roads, which were becoming more and more inadequate, while at the same time the building of new highways and the improvement of old ones was not keeping pace with the demand created by the continually increasing number of vehicles in use.

Four-wheel brakes first commanded serious attention in 1924. One make of car had them as standard equipment the year before, but in this year they were standard equipment on about 14 per cent of the models and optional on nearly 20 per cent more at additional cost.

In 1919 all braking was through the rear wheels either by the direct application of inner shoes or outer bands to drums on the rear wheels or on the drive shaft. The service, or foot, brakes contracted on the rear wheels on 83.2 per cent of the passenger-car models, expanded on the rear wheels on 9.6 per cent; contracted on the transmission on 4.5 per cent; and

expanded on the transmission on 2.7 per cent. The emergency or hand brakes, now usually called parking brakes, expanded on the rear wheels of 91 per cent of the models, contracted on the rear wheels on 6.3 per cent and contracted on the transmission on 2.7 per cent. All 1929 passenger-car models, except one model of the Rolls-Royce, provided four-wheel service brakes. Internal expanding brakes are the prevailing type being found on 75.1 per cent of all models; external contracting, on 13.5 per cent, internal front-wheel and external rear-wheel brakes, on 10.4 per cent; and the exception before noted makes the 1 per cent with rear-wheel brakes only, which are of the internal type. They are just about evenly divided between the mechanically and the hydraulically operated systems. The hand brakes on 57.4 per cent of the 1929 passenger-car models contract on the transmission; 18.1 per cent expand in the rear wheels, an equal percentage in all four wheels; and 6.4 per cent contract on the rear wheels.

There was more variety in the service brakes used on motor trucks. Of the models produced in 1919, the foot brakes on 64.1 per cent expanded in the rear wheels; 22.9 per cent contracted on the rear wheels; 7.7 per cent contracted on the drive shaft; 1.3 per cent expanded on the drive shaft; 3.4 per cent contracted on the jackshafts; 0.4 per cent contracted on all four wheels; and 0.2 per cent contracted on the front wheels.

IMPORTANT PARTS OF HYDRAULICALLY ACTUATED FOUR-WHEEL BRAKE SYSTEM

A shows the master cylinder from which oil is forced to the brake-actuating cylinder which is shown at B. The latter is mounted on each wheel with two pistons between which oil is introduced. The pressure of the oil forces them apart and constricts the band around the drum.

Hand brakes were mostly of one kind, internal expanding on the rear wheels, these being on 90 per cent of the 1929 motor trucks; 6 per cent contracted on the rear wheels; 0.6 per cent, on the front wheels; 2.8 per cent, on the drive shaft; 0.4 per cent expanded on the drive shaft; and 0.2 per cent expanded on all four wheels. Examination of the 1929 truck models shows that almost exactly two-thirds still do not have front-wheel brakes, for 37.1 per cent have brakes on the rear wheels only, 27.2 per cent have the two brakes on the drive shaft and rear wheels and 2.2 per cent have them on the jackshafts and rear wheels. The rest have four-wheel service brakes, 16.2 per cent have the hand brake on the drive shaft; 13.9 per cent have it on the four wheels; 2.7 per cent have it on the rear wheels; and 0.7 per cent have it on the jackshaft. The service brakes on 73.9 per cent of present-day motor trucks are operated mechanically; 12 per cent, hydraulically, 11.5 per cent by vacuum booster; and 2.6 per cent by compressed air.

Motor busses present the most difficult brake problem because of their higher speed and greater weight. This is how it has been engineered in the current models. Service brakes on 60.5 per cent expand on the rear wheels; 34.8 per cent expand on four wheels, 3.5 per cent contract on four wheels, and 1.2 per cent contract on the drive shaft. On 50 per cent, they are mechanically operated, 22.6 per cent use the vacuum boosters, 19.1 per cent, air pressure; and 8.3 per cent are hydraulically operated. The hand brakes on 52.4 per cent of the 1929 motor-bus models contract on the drive shaft; 36.1 per cent expand in the rear wheels, 4.6 per cent expand in four wheels; 4.6 per cent expand on the drive shaft; and 2.3 per cent clamp a disk on the drive shaft.

thinner, more flexible walls and intended to carry lower air-pressure. The object is to secure greater cushioning effect to reduce shock from road irregularities, the softer tires yielding to small inequalities in surface instead of rising over them. Increased comfort to the passengers is the greatest advantage, but a close second is the reduced wear and tear on the vehicle and its mechanism. Car bodies with less racking do not so soon develop squeaks and rattles, and there is slower depreciation of the moving parts when normal wear is not aggravated by shocks that hammer and vibrations that produce crystallization and earlier failure of metal parts under strain.

While experimental work had been going on for several years, it was not until 1925 that they could be considered as really accepted by the industry. In that year, a majority of the makes of passenger cars came out with balloon tires as standard equipment. Meantime, to help the transition and considering the number of older cars on the road, there was a compromise classification of tires known as semi-balloon designed for lower pressure but adapted to fit the standard high-pressure tire rims. True balloon tires required wider rims of smaller diameter. The first balloon tires were for exceedingly low pressures—20 pounds or less. As practice settled down to standard, however, there was a reaction to slightly higher pressures, so that the present range of pressures recommended by the tire manufacturers is from 28 to 40 pounds, depending upon the size of cross-section and load.

Car users themselves were really responsible for bringing the balloon tire into being. Experience had shown them that under-inflated tires rode easier and they persistently ignored the warning to maintain certain pressures to insure

LAYOUT OF HYDRAULICALLY ACTUATED FOUR-WHEEL BRAKE SYSTEM

Tires. Balloon tires and four-wheel brakes are the most outstanding two improvements that have been made in motor cars in recent years and have now become universal in their application to passenger cars. Balloon tires, so-called, are distinguished from earlier pneumatic tires in being of larger cross-section and

long life of their tires. They elected to buy new tires more frequently, if necessary, but comfort they would have. This caused the tire makers to see whether the users could be gratified and started experimentation to develop tire construction that would last reasonably long with the greater flexing of the walls. The high-pressure

tire had already been wonderfully improved and increased in mileage life by replacing the woven fabric form of reinforcement with layers of diagonally laid parallel cords with the cords of alternate layers crossing at right angles and, but for this improved construction, balloon tires could never have been successful. Cord tires themselves should be recorded in our catalogue of advances since 1919, for they came just at the beginning of that year. The first balloon tires were made with few plies of reinforcement—two, three, and four. This was found impractical and now none are made with less than four and most have six or even more in the larger sizes for heavier duty, as on busses and high-speed trucks.

Truck pneumatics have been a development in themselves. Little used 10 years ago, except on light delivery cars, they are being more and more applied to heavier vehicles. Solid tires are a foe to the roads and the trucks on which they are used suffer faster deterioration. On the other hand, pneumatic tires save the roads, the trucks, and the loads, and allow more rapid movement of the goods.

The great multiplicity of pneumatic tire sizes, even for passenger cars alone which absorb the bulk of the production, has been a serious disadvantage to all concerned. The tire factories must have a large number of molds, the tire dealers must carry excessive stocks, and owners must pay the bill for the complication

was some confusion, for the rim diameter was not always correctly obtained by subtracting twice the cross-section from the nominal outside diameter which was not always the actual. For example, a 29×5.00 and a 29×5.25 both fitted a 19-inch rim. Calling them 500-19 and 525-19 emphasizes that fact and leaves no uncertainty as to the wheel they will fit. Similarly, a 32×6.00 and a 30×5.77 both go on a 20-inch rim and are hereafter to be called 600-20 and 577-20. Under the old system, any fractional part of an inch on the tire cross-section was ignored in arriving at the nominal outside diameter; in the new list, there are only eight cross-sections—4.50, 4.75, 5.00, 5.25, 5.50, 6.00, 6.50, and 7.00. The old 4.95, 5.77, 6.20, and 6.75 sizes have been dropped. Until the new marking is familiar, the old will be printed on the sides of tires in smaller figures under the new to show with what older sizes it is interchangeable.

Commercial Vehicles. In the field of commercial vehicles, the most marked development since 1919 has been in motor busses for transportation as a public utility. Busses came to be operated with much success in city services as auxiliaries to the electric street railways, as well as traction line feeders, on inter-city lines, for de luxe tours, for schools, and for sightseeing. They have become a very definite part of the United States' transportation system. Just as motor trucks successfully proved their

FIG. 1. SIDE ELEVATION OF CHASSIS FOR MOTOR BUS
Four driven wheels are employed to support load. Note drop frame to provide low centre of gravity.

when they buy tires. The advent of the balloon and semi-balloon tires aggravated an already bad situation. In 10 years, 52 different tire sizes have been standard equipment on the passenger-car models put out in that time, 17 high-pressure, and 35 low-pressure, sizes. Both the tire and car industries appreciated the desirability of fewer sizes and much discussion took place, but without any real result until the beginning of 1928. Then, the National Automobile Chamber of Commerce, the Rubber Association of America, and the Society of Automotive Engineers succeeded in agreeing on a recommended list of 18 balloon-tire sizes within which all requirements for that year were to be drawn with the prospect of still further reducing the list in subsequent years. Then, as the older cars pass out of use, there will be a gradual reduction of the number of sizes that will need to be made and stocked. At the present writing, it is proposed to drop two more sizes and add one so that 17 probably will be continued as standard.

There also has been a new naming of the sizes. Instead of designating a tire by its nominal outside diameter and cross-section, as for example 31×6.00 inches, it will be designated by its cross-section and the rim diameter as 6.00-19, for the rim dimension is the one that determines whether the tire will go on the wheel for which it is intended. By the old nomenclature, there

economy and dependability as independent freight carriers, the motor bus was fast becoming a vital factor in passenger transportation. Special chassis designs were evolved for carrying bus bodies. By dropping front axles, undersliding the front and rear springs, and in some instances having the frame side members dropped between the springs, busses were evolved which were easy of access and had a low centre of gravity. When a bus body is mounted on the usual type of commercial automobile chassis, it is apt to sway in turning corners, to skid on slippery streets, and to be uncomfortable for passengers. In order to secure easy riding, special spring suspensions and giant pneumatic tires are employed.

Very heavy loads are now carried on large cord tires, and even freight trucks are carried by the more resilient instead of the solid rubber tires. Truck tires are made 8 to 10 inches in width and 40 to 42 inches in diameter, with extra-heavy treads and side walls so that internal pressures from 120 to 130 pounds may be safely withstood. Bus bodies are sometimes carried by special resilient supports, either in the form of rubber pads or metal spring members attached to the chassis frame. One marked improvement was the use of rubber shock absorbers or insulators at the spring ends to replace metal shackles, which soon wear. It is stated that a life of 100,000 miles is not uncommon with the rubber insulators, which act to reduce vibration.

The rubber blocks are molded in suitable shapes to carry the spring-leaf ends and permit the spring leaves to flatten out under load and to move as the spring deflects under the influence of varying highway-surface contour. The blocks of rubber are carried in malleable iron housings forming part of the chassis and are easily renewed when worn.

Motor Rail Cars. Many railroad lines have lost so much of their freight and passenger traffic because of the greatly increasing use of motor vehicles that they have found it unprofitable to operate the usual steam train on short lines. The modification of the motor vehicle known as the rail car has come to the rescue, and motor-truck engineering is followed in many respects. In some cases, the rubber-tired wheels are replaced with flanged metal wheels adapted to run on rails; no other change is made in the chassis. The use of anti-friction bearings of the ball-and-roller type, alloy steels, and aluminium and pressed-steel sections assures heavy-duty qualifications with the economy of light weight. The power plant, change speed gearing, clutch, and power transmission are modified from motor-truck types. The engines are truck engines and usually of the four-cylinder type. Between the engine and the main transmission, an auxiliary reverse transmission is installed which serves to change the direction of main drive shaft rotation when it is desired to reverse the car, and as many reverse speeds as there are forward drive ratios are thus provided. Small rail cars with a passenger capacity of 30 persons can show a profit even if the car does not carry its full capacity on all trips. These cars climb grades well and are controlled much like a motor truck; the engine speed is varied by spark and throttle control, gear shift is made by lever, and the clutch is actuated by pedal control. Of course, the operator is relieved of steering; when a wheel is provided, it is used to operate one set of brakes. Most rail cars are provided with air brakes.

Unit Containers. In freight transportation, containers usually thought of as individual boxes, which can be loaded and sealed by the shipper and transported to the consignee on motor-truck chassis, freight car, boat, or all three, without disturbing the contents, offer great possibilities in the coordination of all transportation facilities and the expediting of freight movement. Some motor-truck manufacturers supply special chassis for handling unit containers, in which mechanism actuated by the engine to facilitate moving them is incorporated in the truck chassis. The demountable body in its various forms was in some use in many parts of the country. It is probably more adaptable for general purposes of motor cartage than the unit goods container.

American Motor-vehicle Industry. Appreciation of the magnitude which the motor-vehicle industry has attained can be had from some figures relating to its 1928 record compiled by the National Automobile Chamber of Commerce. In that year, 4,044,000 passenger cars and 586,000 motor trucks were produced in the United States and Canada. Of the passenger cars, 85 per cent were closed models. The wholesale value of the cars was \$2,630,500,000 and of the trucks, \$415,320,000. The tire production in the United States was 78,500,000.

Distribution. In 1929 there were approximately 32,028,000 automobiles in use throughout the world, the automobile registration having

more than doubled since 1922, increasing in the United States by 100 per cent and in the rest of the world by 210 per cent. There were estimated in countries outside of the United States and Canada 6,330,000 cars, of which about 2,881,000, or 45½ per cent, were manufactured in the United States. The registration of motor vehicles in the United States reached a total of 24,750,000, of which 21,630,000 were passenger cars and 3,120,000 commercial vehicles. Of all the automobiles in the world, 78 per cent is in the United States. Considerably more than half as many motor vehicles as there are in all of the rest of the world, or 5,450,000, are used by farmers in the United States. The road system that has made this large use of vehicles possible includes a total mileage of highways of 3,013,584, of which 615,000 miles are surfaced highway. The number of people employed in motor-vehicle and allied lines—4,110,000—is another index of the size of this industry. The revenue that it brought to the Federal and State governments in 1928 was a tidy sum, taxes on motor vehicles amounting to \$785,386,000.

What the automobile industry means to other business is also interesting. In 1928, 3,600,000 carloads of automotive freight were hauled by our railroads. The automobile industry consumed 85 per cent of all the rubber used in this country, 60 per cent of the plate glass, 12 per cent of the copper, 15 per cent of the iron and steel, and 80 per cent of the gasoline, the last mentioned totaling 10,860,000,000 gallons, and of motor oil, there was consumed 434,000,000 gallons. The crude rubber used by the motor industry in 1928 aggregated 814,000,000 pounds and the cotton used in tires, 299,500,000 pounds.

As showing the rapid increase in the use of motor busses, there were 92,000 in 1928. Of these, the street railways operated 9900 and the steam railroads, 1250. Busses have meant much to the extension of better educational facilities for the youth of our country for there are 14,850 consolidated schools now gathering and returning their pupils by this means. The businesses that are not concerned in the manufacture but in the selling, repairing, storing, and supplying of motor vehicles also have reached striking totals. Car and truck dealers number 53,700; public garages, 51,600; service stations and repair shops, 95,400; supply stores, 79,100; and gasoline filling stations, 317,000.

That the industry will continue to grow and thrive is unquestioned, for the long anticipated saturation point has yet to be reached. The average life of a motor vehicle is seven years; therefore, for replacement alone, it will be necessary to build in such a year as 1929 over two and a half million vehicles, for the production in 1922 was 2,589,620. In addition, there will be the new owners who have never owned cars before and the families that have owned only one but are now finding their needs to require two or more, the additional users of trucks in the natural growth of all lines of business, the increasing numbers of motor-bus lines, and finally, the cars and trucks that will be exported which last year was 810,000; so that it is easily conceivable that the production this year will exceed 5,000,000.

MOULIÉ, CHARLES. See SANDRE, THIERRY.
MOULTON, ARTHUR WHELOCK (1873-). An American Protestant Episcopal bishop, born at Worcester, Mass., and educated at Hobart College, the General Theological

Seminary, and the Episcopal Theological School. He was ordained in the Protestant Episcopal Church in 1901. From 1900 to 1918, he was curate and rector of Grace Church, Lawrence, Mass. He served in the World War as a chaplain in the field artillery and at a base hospital in France. In 1920 he was consecrated bishop of Utah. He wrote *Memoir of Augustine H. Amory* (1909) and *It Came to Pass* (1916).

MOUNT HOLYOKE COLLEGE. A college for women at South Hadley, Mass., founded as a seminary in 1837, and given the college charter in 1888. The enrollment increased from 796 in 1914 to 864 in 1918, dropped to about 800 for each of the succeeding years until 1923-24, when it rose to 946, and had reached 1030 for the autumn term of 1928. The faculty increased from 114 to 124 members with an additional 74 assistants, readers, curators, etc. The library grew from 64,000 volumes in 1914 to 104,000 in 1928. The productive funds of the College for 1927-28 amounted to \$3,965,681, and the income for the same year to \$1,203,152. A student-alumnæ hall, containing an auditorium, banquet rooms, committee rooms, etc., was built in 1916. Williston Hall, the biological building, burned in 1917 and was replaced by a temporary building in the following year, then by a new permanent building under construction in 1923-24. Two new dormitories were built in the latter year, one to replace Rockefeller Hall, which was destroyed by fire in December, 1922. In the autumn of 1924, Cornelia Clapp Laboratory was opened to accommodate the departments of botany, geology, hygiene, physiology, and zoology, each department having laboratories for its different lines of work, and in 1928 two small houses located in the village were acquired for use as a residence for graduate students and assistants, and for freshmen, while a building was under construction to serve the purposes of the English course "Playshop" as a laboratory in the production of original plays. In 1923 a general examination was instituted, to be required of all students at the end of the senior year, in the work of the major subject. President, Mary Emma Woolley, A.M., Litt.D., L.H.D., LL.D.

MOVING PICTURES. Since the first Vitaphone programme was publicly demonstrated in New York City on Aug. 7, 1926, the motion picture has developed more rapidly and changed more completely than in all of the previous period since Edison's invention of the cinematograph in 1894. In that period, all established cinema values have been overthrown; all commercial, technical, and artistic phases have been changed and an entirely new day in the annals of the screen has been introduced. At first, the development was halting and it was widely believed that the introduction of synchronized talk was both a momentary novelty in the history of the films and a backward step in their æsthetics. It was felt by enthusiasts for the silent photoplay that the definitely pantomimic manner of the medium, which had resulted in the American *Greco*, the German *Variety*, the Russian *Potemkin*, and the French *Passion of Joan of Arc*, as well as the inaudible Chaplin comedies, would find but a momentary intrusion on the art of the most distinctive and universal of the modern dramatic forms.

Nevertheless objectors to the arrival of this novelty had forgot the difficult position into which the silent cinema had been forced. It is true that there were over 20,000 moving-picture

theatres in the United States and the local films were highly successful all over the world. In addition, the artistic standards had advanced with great strides, resulting in an increased technical and ideational merit in the pictures arriving from the Hollywood studios. The producers and the public were recognizing that the cinema was a definitely pictorial medium and that it was not a scene by scene imitation of a stage play. At the same time, the producers also were beginning to recognize that the motion pictures gave certain signs of losing their hold on the popular attention. There were pessimistic observers who felt that the films had done everything possible, artistically and economically, with the limitation of silence and that the public was wearying of such a restricted medium. There were evidences of an ominous falling off in interest and attendance. It was at this time that motion-picture audibility appeared as a serious issue.

Though the presentation of the first Vitaphone programme in New York in 1926 marked the beginning of the era of sound, there had been a number of earlier attempts to introduce the new element into the cinema, from Edison's Kinetophone to Whitman's Cameraphone. Before 1917 there had been at least a dozen important experiments in sound photography in America and Europe. In 1917, William H. Bristol received a United States patent and in 1923 Dr. Lee De Forest presented short sound motion pictures which were shown commercially. Just a month after the showing of the Vitaphone programme Dr. De Forest produced a two-reel melodrama, which was the first all talking-film dramas.

The opening programme offered by the Vitaphone device was not all-talking. Will Hays, Martinelli, and Marion Talley were heard upon it, and the feature had a synchronized musical score, but no spoken dialogue. Later, the melodramas, *Tenderloin*, *Glorious Betsy*, and *The Lion and the Mouse* were offered with dialogue sequences, but it was *The Jazz Singer*, starring Al Jolson, which was the first outstanding success in the new medium. The star sang half a dozen songs and had a brief scene in which he talked with his mother, and the resulting show proved so enormously popular that the economic triumph of the new medium was assured. The first full-length, all-talking screen drama—that is to say, the first film of 6000 feet or more—was *Lights of New York*. In it each of the characters spoke lines throughout the entire photoplay. In all of these works, however, the scenes were laid entirely indoors, for in the early stages in the manufacture of audible works, it was found difficult to set up the microphone in the open and record successfully. The short Movietone comedy, *The Family Picnic*, was the first attempt in the new manner to get out into the open air. The first outdoor photoplay of full feature length was *In Old Arizona*, which also was made by the Fox Movietone organization.

After the talking motion picture had been made practical, the cinema scientists returned to their efforts to provide color as well. There had been in the past so many handicaps in the path of perfecting color films that efforts to present film dramas in their natural hues had been intermittent and, on the whole, ineffective. At the coronation of King George V, and the subsequent Durbar in India, Charles Urban made moving pictures with the Kinemacolor process; but these were crude and conducive to eye strain. Following this, color was used chiefly in travel pictures

and short subjects showing rare flowers, birds, precious stones, and fashions. The first full length photoplay to be made entirely in color was *The Glorious Adventure*, a costume drama of the Restoration, but it failed to prove profitable. With the development of the Technicolor process, color photography made a definite advance and the result was such pictures as *Toll of the Sea*, *Wanderers of the Wasteland*, and certain sections of *The Ten Commandments*. All of these, however, were done in silence. The Warner Brothers, who introduced the Vitaphone process, continued their pioneering efforts by offering on May 28, 1929, *On With the Show*, a cinema musical comedy, which was the first full-length photoplay to combine audibility and color. Since then, they have presented *Gold Diggers of Broadway*, which likewise contains both color and sound. In addition, such screen plays containing musical numbers as *The Dance of Life*, *The Broadway Melody*, and *The Hollywood Revue* have used color in presenting revue numbers.

The chief efforts of the screen magnates, however, have been devoted to perfecting sound, both technically and as a dramatic contribution to the motion picture. At the outset, the moving picture found itself with a new mechanical device on its hands and little idea of what to do with it. In one way, the coming of audibility proved rather devastating, with its hasty overthrow of everything that the silent films had done in the way of creating a distinct medium of artistic expression. In addition, there was the at least temporary stop put to the world-wide circulation and influence of the American films. The cinema had begun by accepting the stage as its model and had striven for years to escape from its allegiance and become independent. With the arrival of the puzzling new medium, the only thing left to do was to return to the influence of the theatre and make picture photographs, scene by scene and word by word, of stage plays. The result of this is that Hollywood set out to buy up all the stage plays, stage directors, stage writers, and stage actors it could find, and the best of the earlier talking pictures were the ones that were most careful at photographing effective stage dramas. Gradually, however, the tendency to strike out in the direction of a more distinctive dramatic form has made itself felt. It had been feared that the established screen stars, most of whom lacked stage training, would prove ineffective before the microphone, but experience has proved that their natural, if untrained, voices are really more successful in the new medium than the more studied tones of the stage players. The attempt of the Actors' Equity Association to organize the cinema players, as it had organized those of the stage, likewise resulted in making the latter players less popular with the producers, and with the return of the acting ascendancy to the film actors, the movement away from sheer stage imitation definitely decreased.

Nevertheless, the first important audible screen efforts were frank photographs of stage plays. *The Letter*, adapted from the Somerset Maugham drama, was the first of the works in the new medium to go in for an adult narrative, but though it made certain attempts to use pictorial movement and effects, it was essentially a stage photograph. *The Doctor's Secret*, an intelligent drama based on Sir James M. Barrie's *Half an Hour*, followed the stage form so carefully that it slowed down the movement to the extent that action which was supposed to take

place in 30 minutes took one hour in development. With additional experience in their manufacture, however, the producers slowly learned how to speed up their films, to adopt pictorial methods, and in every way escape from a strict adherence to stage technique. This movement in the direction of freedom reached its highest point when King Vidor's all-Negro photoplay, *Hallelujah*, combined drama, sound, music, and visual effects in a production which suggested pretty definitely that the talking motion picture could be made into a distinctive art form that was a synthesis of drama, poetry, and pictorial splendor.

Music has always been a definite part of the motion picture, since a lone piano accompanied the earliest one-reel photoplay. With the arrival of more pretentious feature films, comprehensive orchestral scores were devised that became an important adjunct to motion-picture presentation. The coming of synchronized talk to the film has by no means done away with the value of music to the screen, and we now have it in the form of an accompaniment to the dialogue, a theme song or a musical comedy number—without which few pictures are regarded as complete. The theme song, which is usually titled so as to have some bearing on the name of the picture, is becoming less necessary to a photoplay, but few films are offered without a scene in which it is possible for some sort of song to be sung by one of the players. The usual way is to arrange for at least one scene to take place during the course of a musical comedy, during which it is possible to present to the audience the valuable commodities of music and dancing. This demand for music in the films being so great, it is natural that the producers have employed to a great extent the presentation of musical comedies and revues in the cinema form. Two productions that promise to become part of a series have been offered in *The Fox Movie-tone Follies* and *The Hollywood Revue*, and another annual show is promised in the *Show of Shows*. Other screen musical comedies have been *The Coconuts*, *On With the Show*, and *The Gold Diggers of Broadway*. In most cases, the method has been to present a dramatic plot to the audience in which the musical and chorus numbers are offered as part of a stage show that figures in the narrative. *The Hollywood Revue* and *The Coconuts*, however, have not bothered with any such suggestion of a realistic story, and have been presented as straightforward, undisguised picturizations of musical shows. The first of the cinema operettas, *The Desert Song*, was likewise offered without the usual formula of a show within a show.

The use, even in an all-talking photoplay, of sound, as opposed to speech, was demonstrated in the melodrama called *Alibi*. The noise of convicts' feet while marching in lockstep; a warehouse robbery to the accompaniment of police whistles and the beat of nightsticks on the curb, a third degree, with only the ticking of a clock to relieve the silence—these were among the most effective scenes of the picture and in none of them was a word spoken. Great mechanical progress has already been made in the talking pictures, but the capture of the human voice still lags behind. In *Bulldog Drummond*, exceptional effect is gained by the sound of rain and the hum of a motor in the dark. The voices recorded in the picture with far more than the average success, but whereas they were a bit less satisfactory

than in real life, the noise of rain and motor proved far more effective and dramatic than their actual sound.

One of the most successful features of the talking pictures has been the Movietone news reel. A sound account of Lindbergh taking off on his historic flight across the Atlantic was one of the early achievements in this field. Since that time, such celebrities as George Bernard Shaw, King Alfonso of Spain, Mussolini, and A. Conan Doyle have been seen and heard on the Movietone, delivering messages to the cinema-going public in English. One of the most effective films of this type was the one in which Premier Macdonald, of Great Britain, informally introduced his Labor cabinet to the public by means of the news reel.

There are two outstanding methods of synchronizing sight and sound on the screen—the sound-on-disc, as presented by the Vitaphone process, and the sound-on-film, as employed in the Movietone process. In the former method, the sound is recorded and reproduced from a disc of the type used in the making of phonograph records. In the theatre, the disc is run off in synchronization with the film, which is timed with the machine that projects the film on the screen. The Movietone, on the other hand, is photographed by means of light variations on the side of the film. Both processes are included under the Western Electric system, to which, according to Harold B. Franklin's authoritative book, *Sound Motion Pictures*, virtually 90 per cent of the screen producers have committed themselves, including such important organizations as the Fox Film Corporation, Warner Brothers, Paramount Famous Lasky Corporation, First National, Universal, and United Artists. There is also the R. C. A. Photophone, which is controlled by the Radio Corporation of America and which is used by Radio Pictures, Tiffany-Stahl, and Pathé. In addition, there are the De Forest Photofilm and the Bristolphone.

Since the coming of audibility, there has been a pronounced tendency on the part of the great film producing organizations to amalgamate. In 1927-29 William Fox bought out Metro-Goldwyn-Mayer, and Warner Brothers purchased First National. In 1929 plans seemed almost completed for an alliance between Paramount Famous Lasky and Warner Brothers. If the deal is successful, the motion-picture industry in America will be controlled by three organizations—the Fox group, the Paramount-Warner-First National combine, and the RKO or Radio-Keith-Orpheum organization.

The confusion into which the film industry in the United States was thrown by the coming of audibility is shown particularly in the field of export. It is obvious that, where the American pictures of the silent era could be shown in every country of the world, the field of the local talking product is definitely limited. In the past, from 30 to 40 per cent of the gross revenue of the American motion picture has been derived from the foreign markets. A great part of this revenue came from various sections of the British Empire, and, of course, in these parts of the world, the American screen drama is both comprehensible in its language and possible as a commercial proposition. Naturally, though, in the nations employing an alien tongue, audible films in the English language are in grave danger of finding an unconquerable barrier, even though the Al Jolson picture, *The Singing Fool*, proved successful in Berlin and Paris. It seems likely,

however, that its success was due chiefly to its value as a novelty and it must further be remembered that the film was dependent on singing rather than dialogue for its effects. Some effort has been made by the American producers to cater specifically to definite countries. *Innocents of Paris*, which featured the French performer, Maurice Chevalier, was made in a French as well as an English version and Irene Bordoni made a film in which she sings in French, German, Spanish, and Italian, in addition to English. A talking version, done entirely in the German language, has been made of the drama, *The Royal Box*, in the United States recently with the Teutonic players, Alexander Moissi and Camilla Horn, in the leading rôles. Such productions, however, are naturally both freakish and incidental, and, on the whole, it is safe to say that the American film industry, without confessing it publicly, has pretty much given up the hope of continuing its complete domination of the foreign market. Sound has given the foreign producers their long-awaited opportunity to compete in their own countries with the American product. Almost every producer in this country is making a silent version of his dialogue pictures for foreign markets, and, although these works are obvious makeshifts, they are likely to be successful until the foreign picture-makers can make something more popular. There is little reason to think they can do so at present, but with the stimulation offered them by the deficiencies of the made-over American products, they are bound to provide more strenuous opposition to the Hollywood producers than before. Over ten million people, it has been estimated, attended silent film performances each week in 1928, and 85 per cent of these pictures were produced in the United States. It is safe to say that no American producer expects such a complete monopoly to continue.

Even without the coming of sound, however, American producers were beginning to experience great handicaps in releasing to the European market, through the restrictions placed upon the American-made photoplays by the chief foreign countries. Quota legislation, for example, was blamed for the drop in exports from a total of 232 million feet in 1927 to 222 million feet in 1928. The first country to regulate the import of American films was Germany, which first demanded that for each one of them admitted, a film must be produced on German soil, but later modified it to admit an American picture for each German work shown in the United States. The Quota law of Great Britain provides that, in 1929, 7½ per cent of the footage exhibited in English theatres must be British-made. In 1930 and 1931, the ratio is to be increased to 10 per cent; in 1932 it becomes 12½ per cent; in 1933, 15 per cent; in 1934 and 1935, 17½ per cent, and from 1936 to 1938, it becomes 20 per cent. In addition, a fund of \$100,000,000 is provided to build up the cinema industry in England. The intention is to give the English moving picture 10 years to become self-supporting. In France, the restricting regulations as modified through the efforts of the organization known as the Motion Picture Producers and Distributors of America, permit 60 per cent of American importations to be admitted into France free, with the added rule that, in exchange for the permission to import any pictures beyond the quota, a number of French films must be distributed in the United States or, as an alternative, seven

licenses can be purchased for each film produced in France. The licenses must be purchased from the French producers.

The producing centre of the American motion picture remains in Hollywood, although a few pictures are produced in New York City, which is the financial centre of the industry. The first photoplays were one and two reels in length, but from the production of *Queen Elizabeth* in 1912, the vogue of the feature film, ranging around 5000 feet, or five reels, began. In 1915, however, David Wark Griffith's *The Birth of a Nation* introduced the era of the multiple reel film and paved the way for 8-, 10-, and 12-reel photoplays. The development of the photoplay, as a matter of fact, has always been based on the method of following the leader. Griffith in *The Birth of a Nation*, introduced the first big battle scenes and his pictures of the Civil War served as models for all war pictures made between 1914 and 1919. Mary Pickford inspired innumerable golden-haired ingenues, and Chaplin, recognized as the outstanding figure in cinema farce, caused all film comics at the time of his emergence to adopt black mustaches and huge shoes. William S. Hart and "Broncho Billy" Anderson led the way in the Wild West melodramas, and Douglas Fairbanks was responsible for acrobatic farce comedies. When George Loane Tucker produced *The Miracle Man*, he promoted a wave of religious enthusiasm in the films. The success of Theda Bara in *A Fool There Was* started the "vampire" craze, which lasted for several years. In the same way, the demand for mother-love themes originated with *Humoresque* and Griffith's massive spectacle, *Intolerance*, created an interest in symbolism. Rex Ingram's *The Four Horsemen of the Apocalypse* started the vogue of the war films, but in this case at least, the successors *The Big Parade*, and *What Price Glory* improved on their dramatic ancestor. Rudolph Valentino started the vogue of the dashing sheik lover. The crook melodrama, *Underworld*, created a deluge of crook melodramas.

After the War, for the first time in seven years, films were imported into the United States from Germany. The first of these, *Passion*, was based on the life of Mme. Du Barry, and it was followed by a host of others including *Deception* and *The Loves of Pharaoh*—all costume dramas. Not all of these works were successful, but they inspired many American producers to produce film plays of a historical nature. The Germans also introduced a distinct innovation in the fantastic photoplay, as exemplified by *The Cabinet of Dr. Caligari* and *The Golem*, which demonstrated that the effect of a supernatural story could be increased by the use of weird, impressionistic settings. The possibilities of the screen as a medium for the development of fantasy were shown by Douglas Fairbanks in *The Thief of Bagdad*. The German film, *Variety*, proved the most successful import financially from the Teutonic studios and another German film, *The Last Laugh*, showed how a silent motion picture could be made without a subtitle. With the success, economic, artistic, or both, of the German photoplays, there was an influx of German directors and players to the United States, and Germans who had been in America at the time the vogue started found themselves in great demand. Prominent in the Teutonic group were Erich von Stroheim, Ernst Lubitsch, Emil Jannings, and F. W. Murnau. Von Stroheim, who had been in the United States since before the

War, made the greatest example of the realistic photoplay in *Greed*, which was based on Frank Norris's *McTeague*. Lubitsch made his reputation making sly sex comedies, of the type of *Kiss Me Again* and *The Marriage Circle*, but he produced one of the outstanding historical dramas in *The Patriot*.

The chief contribution of the Germans to the art of the cinema was that they showed it was possible to transcribe mature films to the screen and proved that a motion picture was a distinctive dramatic form, not a mere silent photograph of a stage play. Chaplin proved something of the same thing in *A Woman of Paris*, the screen drama that he directed. The climax in the development of the silent motion picture, however, came from Russia, where *Potemkin*, *The End of St. Petersburg*, and *Ten Days That Shook the World* established a new school of cinema that was based entirely on pictorial effects, dynamics, and the drama of movement and visual power, rather than on straight story telling. Another important European film was the French *Passion of Joan of Arc*, which was widely heralded as one of the greatest of motion pictures. In the field of the so-called nondramatic films, the most distinguished have been *Nanook of the North*, a camera record of life in the Arctic, *Moana*, which does the same thing for the South Seas; and *Chang*, a picture of wild life in Siam. The first two films were made by Robert J. Flaherty, and the last was produced by Cooper and Schoedsack.

The unit of moving-picture measurement is the reel, which contains about 980 feet of film. Pictures may be of any length, from 1 reel up, although 5, 6, or 7 reels is the average for so-called feature pictures. The running time for one reel through a projection machine is approximately 15 minutes. The film itself is manufactured of a standard size and material so as to be available for use in projection machines in all countries of the world. After the completion of a moving picture, it goes through three stages: exploitation, distribution, and exhibition. For purposes of distribution, the United States is divided into exchange districts. Copies of the pictures are delivered to the exchanges and are rented through them to the theatre owners for purposes of exhibition. This service is given at various fixed rates to the exhibitor, the rate depending on the assumed value of each picture and depreciating as time goes on and the picture assumes wider circulation. "First-run houses," theatres which show pictures which have not been exhibited in their district before, sometimes pay as much as \$20,000 for the rental of a picture for one week.

It is in connection with the representation of dramatic scenes in the form of so-called photoplays that the moving-picture industry finds its widest application. Depicting current events in this way of course aroused interest, but this does not bulk large in connection with the portrayal of successive scenes from some new or standard play in which the action follows along rapidly and emphasizes the dramatic succession of incidents. This involves the reduction of a play to a simple scenario, or story, or it may be the construction of a scenario or outline from new and original ideas. Once this is done, the work of staging and photographing the scenes must be started. This involves large expense and considerable time, as many of the situations may be modified as the work proceeds, to give them

proper dramatic value and effect. For production on the large scale that is now necessary, when moving-picture plays as regards not only elaboration but even the prices charged for admission and seats are in some cases put on a level with actual stage productions, extensive workshops and large studios are increasingly common. Several photographs may be in process of production simultaneously, and a large force of costume makers, scene painters, and other assistants are employed, together with the necessary workshops for developing and finishing the films as rapidly as possible. The expense for the duplication of a film, once it is made, is not large proportionately, and as soon as films are released for rental, the profits, according to the popularity of the subjects, are very large. When a film has been made and found satisfactory for exhibition, it is imprinted with the name of the manufacturer and copyrighted. A film may be run about 500 times in the hands of a careful operator before its condition renders its projection unsatisfactory by reason of streaks and spots that appear greatly magnified upon the screen; in addition to which there is a certain increased fire danger from the frayed and split condition of the edges when exposed to the intense heat in front of the lantern. Recent books in the field of motion pictures are Terry Ramsaye's *A Million and One Nights* (1926), and H. B. Franklin, *Sound Motion Pictures* (1929). See PHOTOGRAPHY.

MOWINCKEL, J. LUDWIG (1870-). A Norwegian Prime Minister and shipowner. He was elected to the Storting in 1906, and served as president of that body (1916-18), Minister of Commerce (1921-22), Minister for Foreign Affairs (1923), and Prime Minister and Minister for Foreign Affairs (1924-26). He was head of the Norwegian delegation to the Genoa Conference (1922), a delegate to the Assembly of the League of Nations (1925), was elected vice president of the Storting in January, 1928, and again became Prime Minister and Minister for Foreign Affairs in the radical cabinet formed in February of that year. He was also a member of the committee charged with making the Nobel Peace Prize awards.

MOWRER, PAUL SCOTT (1887-). An American newspaper correspondent, born in Bloomington, Ill. He studied at the University of Michigan and began his newspaper career as a reporter for the *Chicago Daily News*, in 1905. He was a correspondent at the front for the same newspaper in the first Balkan War and again in the World War. In 1921 he acted as special correspondent at the Disarmament Conference. Since 1922 he has been European Director of the *Chicago Daily News Foreign Service*. He wrote *Hours of France*, poems (1918), *Balkanized Europe—a Study in Political Analysis and Reconstruction* (1921); *The Good Comrade and Fairies*, poems (1923); *Our Foreign Affairs—a Study in National Interest and the New Diplomacy* (1924); and *The Foreign relations of the United States* (1927). He also contributed many articles to magazines on world politics.

MOZAMBIQUE. See PORTUGUESE EAST AFRICA.

MUCK, muk, KARL (1859-). A famous German conductor (see VOL. XVI). During 1912-18 he was the conductor of the Boston Symphony Orchestra, which under him reached the zenith of its glory. It was he who shattered the time-honored tradition that the soloist was the principal attraction at a symphony concert.

Suspected as an alien enemy, he was arrested and interned in 1918. Returning to Germany the following year, he resumed his activity as a guest-conductor. In 1922 he became regular conductor of the Philharmonic Society in Hamburg. From 1901 on, he was the sole conductor of the Parsifal performances at Bayreuth.

MUIR, mūr, RAMSAY (1872-). A British historian, educated at University College, Liverpool, and Balliol College, Oxford. He was lecturer at the University of Liverpool (1900-06), professor of history at Liverpool (1906-13), and was at the University of Manchester (1913-21). He also served as a Liberal member of Parliament from Rochdale (1923-24). His works include *History of Liverpool* (1907); *Peers and Bureaucrats* (1910); *Atlas of Modern History* (1911); *Making of British India* (1915); *Nationalism and Internationalism* (1916); *The Expansion of Europe* (1917); *National Self-Government* (1918); *History of the British Commonwealth* (2 vols., 1920-22); *Liberalism and Industry* (1920), *Politics and Progress* (1923).

MÜLLER, mül'ër, GEORG ELIAS (1850-). A German psychologist. He completed his analysis of memory (*Analyse der Gedächtnis Statigkeit*) in 1917. As representative of the associationistic school, he opposed the relativistic notions of the proponents of the *Gestaltpsychologie* (see PSYCHOLOGY, Perception). His book on *Complextheorie und Gestalttheorie, ein Beitrag zur Wahrnehmungs Psychologie* (1923), is a defense of associationism against its critics. His later works include *Abriss der Psychologie* (1924) and *Typen der Farbenblindheit* (1924).

MÜLLER, HANS (1882-). An Austrian writer and dramatist, born at Brunn and educated at the University of Vienna. He traveled extensively in Germany, Austria, Italy, France, Belgium, Holland, and England. He is the author of *Dammer* (1900); *Die Lockende Geige* (1903); *Der Garten des Lebens*, a Biblical epic (1904); *Die Rosenlaube* all verse (1909); *Buch der Abenteuer* (1905); *Geheimnisland* (1909); and *Traume und Schaume* fiction (1911). His reputation rests chiefly on his plays, which include *Der Reizende Adrian* (1913); *Die Blaue Kuste* (1914); *Könige* (1915); *Violante* (1916); *Der Schöpfer* (1918); *Die Sterne und Die Flamme* (1920); *Der Vampyr* (1922); *Der Tokajer* (1924); *Veronika* (1926); *Die goldene Galcere* (1926); and *Das Wunder der Heliane*, an opera libretto (1927).

MULLER, mül'ër, HERMAN (1876-). A German Chancellor, born at Mannheim. He became a contributor to the *Görlitzer Volkszeitung* in 1899, a member of the Reichstag in 1916 and leader of the Social-Democratic Party in 1919. He served as Minister for Foreign Affairs (1919-20), and as Chancellor in 1920 and again after June, 1928.

MÜLLER-FREIENFELS, RICHARD (1882-). A German writer, born at Ems and educated at the universities of Munich, Berlin, Geneva, Tübingen, Paris, London, and Zurich. He traveled in Europe, Asia, and Africa. His works include *Psychologie der Kunst* (1912); *Deutsche Denker und die Phantasie* (1916); *Persönlichkeit und Weltanschauung* (1918); *Psychologie der Religion* (1920); *Philosophie des Individualismus* (1920); *Psychologie des Deutschen Menschen* (1921); *Bildungsstufen und Erziehungsmöglichkeiten* (1921); *Irrationalismus* (1922); *Erziehung zur Kunst* (1925); *Die Seele des Alltags* (1925); *Metaphysik des*

Irrationalismus (1927). He edited the works of Goethe and Eduard von Hartmann's *Philosophie des Schönen* (1927).

MÜLLER-URY, ADOLFO (1864-). A Swiss-American portrait painter (see Vol. XVI). His later portraits include Mrs Woodrow Wilson (1916); President Wilson delivering his War Speech before Congress on Apr. 3, 1917; Cardinal Mercier, during his visit to the United States, for the Catholic University at Washington; Pope Pius XI (1922); and many others. Pope Pius XI conferred the Knighthood of St. Gregory on him in 1923.

MUNDELEIN, GEORGE WILLIAM (1872-). An American cardinal, born in New York City and educated at Manhattan College, St. Vincent Seminary, and in Rome. He was ordained priest in 1895 and served as associate secretary to the bishop and as pastor in Williamsburg, Pa., from 1895 to 1897. From the latter year until 1909 he was chancellor of this diocese. In 1903 he was appointed censor of the Liturgical Academy, the only American holding that office. In 1906 he received the appointment of domestic prelate and in 1909 was appointed titular Bishop of Loryma and auxiliary Bishop of Brooklyn, N. Y. He held this office until 1916, when he was made Archbishop of Chicago. He was founder and president of the Seminary of St. Mary's of the Lake, at Mundelein, Ill. In 1924 he was elevated to the rank of cardinal.

MUNICH, mŭ'nĭk. The capital of Bavaria and a cultural centre of Germany. The population at the census of 1925 was 680,704. On May 7, 1925, the German Museum of Natural and Technical Sciences, the largest and most unique museum of its kind in the world, was opened. The project was started in 1906, but its completion was delayed on account of the outbreak of the World War. The exhibits include those showing raw materials, their means of production and refinement, the exploitation of natural sources of energy; construction of bridges, tunnels, canals, and other engineering feats and the development of railroad, steamship, and aeroplane transportation, municipal operation, scientific agriculture; physics, chemistry, geology, and astronomy. The aim of the museum is to afford an insight into the progress of mankind in conquering the forces of nature. In 1921 the Michaels-Kirche, which had been used as a Court church from 1773 to 1818, was restored to the original owners, the Jesuits, and the former royal palace was opened as the Residenz Museum. The Marstall Museum, opened in 1923 and housed in the old royal Riding School, contains state coaches, sleighs, harnesses, etc., belonging to the electors and kings of Bavaria. Since 1926 the Ethnographical Museum, depicting the folk ways of all races and nations, has been housed in the Old National Museum. The new Sociological State Museum contains exhibits pertaining to the prevention of accidents, industrial hygiene, and various devices for the comfort and safety of workers. In 1929 the Lenbach Gallery was enlarged and was opened as the Municipal Gallery of Modern Art. The Munich War Memorial, a simple but impressive monument, was erected in 1924 in front of the Bavarian Army Museum. It consists of a sunken court, on the walls of which are inscribed the names of 13,000 men from the city of Munich who died for the Fatherland, surrounding a cenotaph on which lies the prostrate figure of a warrior.

On one side appear the words, "To Our Dead," and on the other side, "They Shall Return."

History. In October, 1918, Bavaria was one of several German states which threatened to secede and set up an independent republic. Red flags were displayed in Munich, and popular meetings were held demanding the Kaiser's abdication. On November 7, the Bavarian Republic was proclaimed under Kurt Eisner as Prime Minister. A few days later the Revolution had spread to Berlin. On Feb. 21, 1919, Eisner was assassinated by an army officer. The murder was attributed to the well-known separatist policy of the Bavarian Prenner who had violently attacked Prussia and had broken relations with Berlin. On April 6, a Soviet republic was declared in Munich but was promptly suppressed by the calling in of Prussian troops. After the short triumph of the Reds, the Conservative and Clerical elements regained power and completely crushed their former adversaries. The leader of the reactionary majority was General von Ludendorff. A systematic campaign was carried on under him in the interests of the old militarist and monarchical elements. Anti-Prussian propaganda, resistance to the payment of the reparations, and opposition to disarmament were characteristic features of this activity. On Nov. 8, 1923, the Bavarian reactionary elements, in open defiance of the central authorities, seized the Government at Munich, but their attempted *coup d'état* to set up a dictatorship was unsuccessful. With this failure, the monarchists lost their control over the government.

MUNICIPAL ENGINEERING. See CITY PLANNING, GARBAGE AND REFUSE DISPOSAL, MUNICIPAL GOVERNMENT, MUNICIPAL OWNERSHIP, ROADS AND PAVEMENTS; SEWAGE AND SEWAGE DISPOSAL; WATERWORKS AND WATER PURIFICATION.

MUNICIPAL GOVERNMENT. Sweeping changes in the framework of municipal government have taken place in the United States in the first thirty years of the twentieth century. These began with the widespread adoption of the commission plan in the first part of the period, subsequently succeeded by almost as extensive adoption of the commission or council-manager plan. Both plans comprise a small council or commission, generally five, but sometimes seven or more, in number. In the commission plan, this body exercises both legislative and administrative functions, each commissioner heading a city department. In the newer plan, the commission or council is limited to legislation but controls administration through the employment of a manager who, so long as in office, is the chief administrator of the city. Growth of the straight commission plan declined with the rise of the council-manager plan, partly through changes from the commission to the commission-manager type.

Among the States, the chief exception was New Jersey, where it was not until 1923 that the Legislature authorized the adoption of council-manager charters, and where, up to 1929, very few places had availed themselves of the enabling act. Of the two largest cities that adopted the plain commission plan, New Orleans and Buffalo, the latter changed back to the old mayor-and-council type on Jan. 1, 1928 (see *New International Year Book*, 1927), but kept the number in the council down to 15. The small or relatively small council was general in 1929, even where neither the commission nor commission-manager

charter prevailed. Two-chamber councils had almost disappeared, a striking change in this respect having been effected at Philadelphia on Jan. 1, 1920, when a single council of 21 members was substituted for a bi-cameral body with a combined total of 144 members. Manager cities had risen to over 400 in 1920, as detailed further on.

City and county consolidation was to the front in various parts of the country up to the close of 1929, with few, if any, additions to examples of long standing here and there—Philadelphia, Denver, and San Francisco, with each of the five boroughs composing New York City co-terminous with a county of the same name. Two notable proposals for the consolidation of all the minor civil divisions within a county into a single government, controlling all county-wide services but leaving local autonomy largely untouched, were pending early in 1929: one covering Pittsburgh and other places in Allegheny County and the other embracing Cleveland and Cuyahoga County. The former was authorized by a State constitutional amendment approved at the general election in November, 1928, and detailed in a charter drafted by a commission for introduction in the Pennsylvania Legislature early in March, 1929. Under this amendment, some 120 cities, boroughs, and townships included within Allegheny County would become the Consolidated City of Pittsburgh, governed in matters of county-wide concern by seven commissioners, but with four municipal divisions, including one for the Pittsburgh of 1929, and with certain powers of the 120 existing communities left undisturbed. The plan was defeated at a special election of the municipalities, boroughs, and townships concerned held on June 23, 1929.

For the 59 cities, villages, and townships, and 33 school districts in Cuyahoga County, the Regional Government Committee of 400, through a fact-finding committee, made public in January, 1929, a constitutional amendment which failed to pass the 1929 Legislature. The proposed plan would give unified control of highways, water supply, sewage disposal, transit, public health and parks, so far as these are of country-wide concern, but would leave undisturbed the activities of the various local governing bodies. In California, a two-county consolidation, at least as to some functions, was proposed late in 1928 in a report on a survey of San Mateo and San Francisco counties. See also CITY AND REGIONAL PLANNING.

Charters and Municipal Home Rule. One by one, the various State Legislatures of the Union have given up the early and long-prevailing practices of enacting separate charters for individual cities. In some places, it is still within the power of the Legislature to do this, although the power is rarely exercised. A number of State constitutions prohibit all legislation applying to one city only. Some years ago, New York State made such legislation subject to local veto by the mayor or in smaller places by the local legislative body. New York in 1914 and Massachusetts in 1915 passed optional charter acts under which municipalities can by popular vote choose between six types of charter in New York and four types in Massachusetts. The three main types in each State are the federal or mayor-and-council type, with varying degree of separation between legislative and executive functions; the commission plan, and the commission-manager plan. In 1924 the Legislature of New York State passed the Home-

rule Enabling Act (Chapter 303, Laws of 1924) authorized by a constitutional amendment adopted in 1923, which extends broadly to all kinds of strictly local legislation, including the making and amending of municipal charters, but leaves unaltered the power of the Legislature to pass certain kinds of laws applicable to all municipalities. The amendment also authorizes the Legislature to pass special legislation by a two-thirds concurrent vote of each house, on receipt of an emergency message from the Governor. Every city is granted constitutional power to adopt and amend local laws not inconsistent with the constitution and laws of the State. These laws may relate to a wide range of subjects. The amendment makes it the duty of the Legislature to provide by general law for putting the amendment into effect. The Enabling Act authorizes any local legislative body to pass local acts superseding existing State legislation applying to the municipality in question alone. The act makes compulsory a referendum vote on certain charter changes and local ordinances such as those changing the veto power of the Mayor, creating a new executive office, abolishing a branch of the legislative body, or alienating city property. Other kinds of local acts are subject to referendum on petition. Provision is made for local drafting of new charters.

In the case of New York City, and in recognition of the large legislative powers vested in the Board of Estimate and Apportionment, the Enabling Act gives the power to enact local laws to a bicameral body known as the Municipal Assembly, consisting of the Board of Estimate and Apportionment and the Board of Aldermen. Before they are approved by the Mayor, he must give a hearing on all local laws passed by the Assembly. The Mayor's veto of such laws may be reconsidered by the Municipal Assembly and passed over the veto by a two-thirds vote. On reconsideration, the Mayor is not allowed to vote.

The New Jersey Legislature of 1923 granted to any municipality in that State the right to adopt the commission-manager form of city charter. A plain commission-plan enabling act was passed some years earlier and had been widely adopted in the State, but repeated efforts to secure the manager plan were defeated until 1923.

GROWTH OF CITY-MANAGER CITIES
(From *Public Management*, March 1, 1929, tentatively revised to end of 1929)

Rapid Progress of City-Manager Plan. Up to 1914, the city-manager plan had been adopted by only 23 municipalities; the first of these was Staunton, Va., which created the office of business manager by ordinance in 1908. From 1915 on, there was first slow and steady and then more rapid progress in the adoption of the manager plan. Records kept by the International City Managers Association showed that to Jan. 1, 1929, about 410 cities had adopted the manager plan. About 400 were in the United States, a dozen in Canada, and two in New Zealand.

In the United States, all but 12 States had one or more manager cities, Michigan leading with 44. The 12 largest cities which had adopted the manager plan up to the end of 1929, with their populations as of July 1, 1928 (U. S. Census Bureau estimates) were Cleveland, 1,010,000; Cincinnati, 413,000; Kansas City (Mo.) 391,000; Indianapolis, 382,000; Rochester, 328,000; Dayton, 185,000; Norfolk, 184,000; Fort Worth, 171,000; Grand Rapids, 164,000; Fall River, 134,000; San Diego, 119,000; Knoxville, 105,000.

In the Irish Free State, a city-manager bill was enacted by the Legislature early in 1929. The plan had been recommended for Dublin by a government commission and a bill to put it in effect was scheduled for enactment by the close of 1929.

The total number of manager cities given does not include those that have abandoned the plan. Of these, there are about 80 that were reported as having adopted the plan, but of that number, the reports were unfounded in many cases. Over 70 either never really adopted the plan or else adopted and abandoned it under ordinance. The plan has been abandoned by only seven cities that adopted it under charter. The largest of these was Akron, Ohio, which adopted a manager plan not wholly standard in 1920 (population then 208,000) and gave it up four years later. The other charter cities which abandoned the manager plan by vote of the people are Waltham, Mass., Tampa, Fla., Albion, Mich., Collinsville, Ark., Lawton, Okla., and Santa Barbara, Calif. In 1927, 1928, and 1929, Cleveland voted against abandoning the manager plan, as did Norfolk, Va., in 1928. Cleveland, Ohio, where the plan went into effect Jan. 1, 1924, pays its manager \$25,000 a year and a number of other cities pay from \$10,000 to \$20,000.

Bibliography. information in government publications of various countries. For monthlies devoted to municipal affairs generally, see *American City* and *National Municipal Review* (New York); and for a British weekly, see *Municipal Engineering* (London). Consult also various journals covering either the whole field or some branch of municipal engineering. See CITY PLANNING; GARBAGE AND REFUSE DISPOSAL; MUNICIPAL OWNERSHIP; SEWERAGE, WATERWORKS.

MUNICIPAL LEAGUE, NATIONAL. An organization for the study of municipal problems and the dissemination of information on subjects relating to them, founded in 1894, and incorporated in 1923. The League meets annually, and during the year its work is carried on under the following committees. Committee on Government for Regional Areas; Committee on Municipal Budget Law; Committee on Revising Model City Charter, and Committee on Election Administration. At the thirtieth convention, in Boston, 1924, held jointly with the Governmental Research Association and the National Association of Civic Secretaries, the topics discussed included methods of financing public improvements, governmental research, transportation, and municipal home rule. Frank L. Polk became president. In 1925 the League met, with the American Civic Association, at Pittsburgh, Pa., also holding sessions with the Governmental Research Conference, and the National Association of Civic Secretaries, the main subjects under consideration were the technique of influencing public opinion, enlisting interest in public affairs, and planning and managing metropolitan regions. By 1926 the League had published a model municipal bond law, a model system of election registration, and monographs on municipal budgets, and on depreciation in public utilities. Various civic problems were debated at the annual convention at St. Louis in 1926. The following year, at the meeting in New York, interest centered around questions of finance, and of crime, joint sessions on various phases of those subjects being held with the Governmental Research Conference, and the National Association of Civic Secretaries. A monograph, *The Merit System in Government*, was added to the list of important publications. Richard S. Childs succeeded Mr. Polk as president. The League publishes monthly the *National Municipal Review*, under the editorship of H. W. Dodds. Headquarters are at 261 Broadway, New York.

MUNICIPAL OWNERSHIP. Throughout the United States, waterworks lead public utilities in percentage of plants municipally owned. Electric-light-and-power plants come next. There is then a big drop to gas works, and a further drop to electric railways. Telephones are practically, if not wholly, privately owned. Of sewerage systems, not generally classed as public utilities, there are about as many privately owned systems as there are gas works municipally owned. In size of cities and total population, municipally supplied waterworks are far in the lead. Most of the many municipally owned electric and gas plants supply relatively small cities. This is also true of the privately owned sewerage systems. A few passenger ferries are municipally owned, notably by New York and Boston.

Private toll bridges, once common, had been almost entirely superseded by free bridges publicly owned until about 1925, when toll bridges of both classes of ownership began to come

back to meet the rapidly growing motor traffic demands. These were generally large and costly bridges, considered to be beyond financing as free bridges. Notable instances are the publicly owned Philadelphia-Camden Bridge over the Delaware, opened to use in 1926, and the Hudson River Bridge between New York City and Fort Lee, N. J., construction of which was started in 1927. It is expected that toll on these bridges, as on the publicly owned Holland Vehicular Tunnel, between New York City and Jersey City, will be discontinued or reduced when the bonds for their construction have been paid off. Where a wise policy prevails, the new privately owned toll bridges are subject to public control of rates and ultimate public ownership.

All of the largest ten cities of the United States owned their waterworks in 1929 and the eleventh, San Francisco, had been engaged for several years in the construction of supply works and in 1928 voted bonds to buy the works of the Spring Valley Water Company. Of the largest 100 cities of the United States, only 12 were supplied by private water companies at the close of 1928: San Francisco, Indianapolis, Birmingham, New Haven, Bridgeport, Scranton, Paterson (municipal acquisition in progress), Elizabeth, Utica, St. Joseph, Wichita, and Johnstown (purchase of private works proposed). No figures showing waterworks ownership for the whole country have been compiled since those given in the *McGraw Waterworks Directory* for 1915. Of 4400 works there listed, 3045, or 70 per cent, were municipally owned. The probable number of waterworks in the United States early in 1929 was 10,000, of which it was estimated 75 per cent were municipally owned, serving 85 to 90 per cent of the population supplied. In Canada, the corresponding percentages were probably equally high. Montreal, in 1928, bought a private waterworks that supplied a considerable part of the city and some outlying municipalities. In Great Britain and Germany, most of the cities own their waterworks.

Of 4003 electric-light plants in the United States in 1928, 47 per cent were municipal and 53 per cent private, the actual numbers being 1910 and 2153. See *Electrical World*, New York, Jan. 5, 1929. Only some 25 of the publicly owned plants were in places of over 25,000 population, while the total population supplied by the municipally owned plants was only some 7,500,000. In terms of generator capacity, the municipal and private plants stood at about 1 to 20. Of 1000 or less gas works in the United States, only about 5 per cent were municipally owned in 1929. The largest plant, owned by Philadelphia, recently had been leased for a second 25 years to a private company for operation. The largest municipally owned and operated gas works in the United States were those supplying the Omaha, Nebr., metropolitan district (which also owns and operates waterworks and ice plants), Richmond, Va., and Duluth, Minn. See *McGraw Central Station Directory* for details of individual electric-light-and-power plants; also *Brown's Gas Directory* and *McGraw Electric Railway Directory*.

Street railways are but rarely under municipal ownership in the United States, but more commonly in Canada, and still more generally in Great Britain. In point of magnitude of works and capital investment, the subways and other railways forming part of the rapid-transit system of New York City lead the country. These,

however, are privately operated, as were the municipally owned subways and elevated lines of Boston until after the World War, since when they have been publicly operated. The municipally built rapid transit lines of Philadelphia are operated by a private company. San Francisco, Seattle, and Detroit have gone extensively into municipal ownership of street railways.

In Ontario, Canada, there is a large mileage of publicly owned and operated railways, largely supplied and partly operated by the Ontario Hydroelectric Commission. Of 40 to 50 American cities having privately owned sewerage systems, most are located in Texas and New Jersey, the largest being at Atlantic City, N. J.

Municipal ownership in Germany (according to *Zeitschrift für Kommunalwirtschaft*, Sept. 25, 1928, abstracted in *The National Municipal Review*, February, 1929) prevailed as to waterworks in the majority of cities. In 1925 some 60 per cent of the electric energy generated was produced by municipal plants, while for gas in 1926, the corresponding figure was 90 per cent. Most of the street railways were under "communal control." The Public Ownership League of America, with national headquarters in Chicago, is devoted to the promotion of public ownership and democratic control of public utilities and natural resources. For some of the material gathered under its auspices, see Thompson, *Public Ownership* (New York).

MUNICIPAL TAXATION. See TAXATION IN THE UNITED STATES.

MUNITIONS OF WAR. See ORDNANCE

MUNSEY, FRANK ANDREW (1854-1925)

An American publisher (see VOL. XVI). During the decade 1914-24, he was especially active in the newspaper field and established and acquired by purchase several newspapers, including the *Washington Times*, *Baltimore News*, *New York Sun*, *New York Globe*, *New York Mail*, *New York Telegram*, and *New York Herald*. The last, he sold in 1924 to Ogden Reid, who consolidated it with the *New York Tribune*.

MURDOCK, VICTOR (1871-). An American legislator (see VOL. XVI). In 1917 he was appointed a member of the Federal Trade Commission. He was reappointed for the term expiring 1925 and resigned in 1924, becoming editor-in-chief of the *Wichita Daily Eagle*. In 1914-16 he was chairman of the Progressive National Committee. He wrote *China, the Mysterious and Marvellous* (1920) and *Folks* (1921).

MURRAY, (GEORGE) GILBERT (AIMÉ) (1866-). An English philologist (see VOL. XVI). He was Charles Eliot Norton professor of poetry at Harvard University (1926). After the World War, he worked for international understanding, publishing *Faith, War, and Policy* (1918) and *Problems of Foreign Policy* (1921), and acting as president of the League of Nations' Union (1923-), and of the Students' International Union since its formation in 1924. He wrote *Stoic Philosophy* (1915); *The Foreign Policy of Sir Edward Grey* (1915); *Euripides and His Age* (1918); *Satanism and the World Orders* (1920); *Collected Essays and Addresses* (1922); *The Rise of the Great Epic* (1907, 1911, 1924); *Five Stages of Greek Religion* (1913, 1925); *The Classical Tradition in Poetry* (1927); *The Ordeal of This Generation* (1929). To his list of verse translations of Greek plays, he added *The Alcists of Euripides* (1914); *The Agamemnon of Aeschylus* (1920); *Choephore* (1923); and *Eumenides* (1925).

MURRAY, JOHN GARDNER (1857-1929). A presiding bishop of the Protestant Episcopal Church in the United States, who was born at Lonaconing, Md., and trained for the ministry at Wyoming Seminary, Kingston, Pa., and Drew Theological Seminary, N. J. To aid in the support of his family, he interrupted his ecclesiastical training for eleven years (1881-92) and engaged successfully in business. Ordained in 1894, he assumed charge of missionary work in Southern Alabama for several years and then served as rector of churches in Birmingham, Ala., and Baltimore, Md. (1896-1909). In the latter year, he was consecrated Coadjuter Bishop of Maryland and in 1911 became Bishop of Maryland. He was elected presiding bishop of the Protestant Episcopal Church in October, 1925, for the term 1926-31 inclusive. He died of an apoplectic stroke Oct. 3, 1929, while presiding over a national convention of the House of Bishops at Atlantic City, N. J.

MURRAY RIVER WORKS. See CANALS.

MURRY, JOHN MIDDLETON (1889-). A British journalist and writer, editor of the *Adelphi*, who was born at Peckham, London, and educated at Christ's Hospital and Brasenose College, Oxford. He was on the Staff of the *Westminster Gazette* (1912-13), art critic for it (1913-14), reviewer on the *Times Literary Supplement* (1914-18), editor of the *Athenaeum* (1919-21), and later of the *Adelphi*. He was connected with the War Office in the political intelligence department (1916-19), and was chief censor in 1919. In 1913 he married Katherine Mansfield, and in 1920 he was made an officer of the Order of the British Empire. Besides articles in magazines and several translations from the Russian, his works include *Still Life* (1917); *Fyodor Dostoevsky* (1917); *Poems* (1919); *The Evolution of an Intellectual* (1920); *Cinnamon and Angelica*, a play (1920); *The Things We Are*, a novel (1922); *The Problem of Style* (1922); *Pencilings* (1923); *Discoveries, essays* (1924); *To the Unknown God* (1924); *Keats and Shakespeare* (1925); *Life of Jesus* (1926); *Things to Come* (1928), and *God*, a sequel to his *Life of Jesus* (1929). He edited the *Journal of Katherine Mansfield* (1927), and *Letters of Katherine Mansfield* (1928).

MUSCLE SHOALS. A location on the Tennessee River 2.7 miles above the railway bridge at Florence, Ala., and a few miles from Sheffield. During the War, the United States put under way a notable development there for the manufacture of nitrates for use in military explosives and also a large power plant involving the construction of a 100-foot dam across the river. (See DAMS, *Wilson Dam*.) Under the terms of the National Defense Act of 1916 the site for the dam at this point was acquired, and in the following year United States Nitrate Plants No. 1 and No. 2 were planned, the latter directly at Muscle Shoals. This was done in order to secure an adequate supply of nitrate for the manufacture of munitions in case the United States should be cut off from the material imported from Chile. The reason for locating such plants at Muscle Shoals was the great power to be obtained from the Tennessee River, the fourth in size of the rivers of the United States, having a flow of 8000 to 500,000 cubic feet per second and in this vicinity a fall of over 134 feet in 37 miles. The Tennessee River is navigable from its mouth to the foot of Muscle Shoals, and the completion of the No. 2. or Wilson Dam at this point with its lock

and the construction of No. 1 Dam, a small dam for navigation, only two miles below the Wilson Dam, would extend navigation for a distance of 15 miles. The building of the proposed Dam No. 3, 50 feet high, would extend navigation 65 miles further and supply additional power. Up to 1924, navigation of the river had been slight, but much interest centred in the development of power, particularly at Dam No. 2, the Wilson Dam. Here, for 12 months in the year, there would be available 87,300 horse power and for 97 per cent of the time, 100,000 horse power, while for 2½ months the available power would increase up to 600,000 horse power. The United States No. 2 Nitrate Plant at Muscle Shoals was completed so that operation could begin on Oct. 27, 1918, and it continued for a sufficient time after the Armistice to show that it could be run successfully. It had a capacity of 220,000 tons of cyanamid or 110,000 tons of ammonium nitrate per annum. This plant was of course operated by steam power; there is a 60,000 kilowatt steam-power plant at Muscle Shoals. Electricity was supplied over a 90-mile transmission line from a 30,000-kilowatt steam plant on the Warrior River. The plant at Muscle Shoals cost approximately \$70,000,000 and the Warrior River plant and transmission line about \$5,000,000 additional. The raw materials required for nitrogen fixation were coke from the Birmingham district or eastern Tennessee, limestone from the Waco quarry, 30 miles distant, and nitrogen from the air. The principal item was the cost of power; 85,000 kilowatts were required, and the steam plants were used pending the completion of the large dam across the river. The No. 2 plant could supply the nitrogen for 12 infantry divisions at the rate it was used in the War, or more than one-third of the inorganic nitrogen used in the production of fertilizers in the United States at this time. Consequently, in the latter connection after the end of the War, the farmers became interested in the utilization of the plant as an agency to increase the supply and decrease the cost of fertilizer. Accordingly, after the War, the future of this great power and manufacturing development aroused debate.

After a curtailment of the construction work on the Wilson Dam in 1921, it was decided to proceed vigorously with its completion, but no decision was reached as to the method of utilizing the power that would be developed. Offers were made by various interests. In and out of Congress, different schemes have been actively discussed but the question of what is to be done with the government-owned property at Muscle Shoals in 1929 was still undecided. In general, Congress has been opposed to the sale or lease of this property to private interests. On the other hand, a bill providing for the operation of the property by a corporation, consisting of five members to be appointed by the President, for fertilizer production with the right to sell surplus power, was killed by President Coolidge in 1928 by a pocket veto. This was clearly on the ground that the Government should not embark in the power business. In the meantime, the need for great amounts of power in the nitrate business has passed, the South is undergoing a rapid industrial development. See FERTILIZER; WATER POWER.

MUSIC. About the beginning of the second decade of the present century, Futurism was just making its appearance, and the majority of

musicians, as well as music lovers, then regarded the new movement as an aberration of taste not worthy of serious consideration. A few short years, however, witnessed such a rapid and general spread of the new cult that Futurism was no longer to be ignored. To understand the situation, it is necessary to distinguish between Impressionism and Futurism. Impressionism began as a reaction against the all-pervading influence of Wagner. To the direct, vivid, and concentrated expressiveness of the Bayreuth master, the Impressionists, under the leadership of Debussy, deliberately opposed mere suggestiveness, vague moods, and intangible atmosphere. For the fundamental principle of thematic development, they substituted the mere statement of themes, which followed one another in kaleidoscopic succession, without systematic repetition or development; but the necessity of themes as basic material was still recognized.

The conscious employment of the higher overtones, while extending the possibilities of harmonic combinations and progressions for the attainment of special effects, was carried to excess from the very beginning, with the result that impressionistic music rests not on the foundation of consonance, which was formerly the foundation of all music, but on dissonance. Taking Debussy as their starting point, a group of younger composers sprang up who soon made a caricature of Impressionism, and whose tendencies were dubbed Futurism. These innovators, dispensing altogether with thematic invention, employed mere rhythmical figures. Regularly defined rhythm was soon scorned as monotonous, and constant variation of rhythm was adopted as a fundamental principle. Different instruments played different rhythms simultaneously, so that each instrumental part was entirely independent of all the others. This brought with it the complete and intentional disregard of the harmonic relations of sounds. The preponderant use of dissonance by the Impressionists had already obliterated the dividing line between euphony and cacophony, and now the Futurists denied the essential difference between consonance and dissonance, proclaiming a system of "free harmony" which permitted the combination and juxtaposition of all sounds, irrespective of relationship.

This system frankly adopted cacophony as its basic principle. As compositions were no longer written in a recognizable tonality, key signatures disappeared and each accidental was marked individually, with the result that the printed page is as bewildering to the eye as the actual sounds to the ear. This method of writing soon became known as Atonalism. Some Futurists, however, insist on a distinction between Atonalism, the negation of the diatonic scale and the triad, and Polytonalism, the superposition or interlocking of various tonalities. Thus, in a string quartet, by Casella, the first violin plays in E \flat minor, the second violin in B \flat major, the viola in F \sharp minor, and the cello in D minor. The constant change of rhythm quite naturally led to the abolition of time signatures and bar lines. The next step was the introduction of quarter-tones, the scores of Alois Hába were actually published in the new quarter-tone notation. The craze for novel effects also led to an abnormal augmentation of the mechanical means of sound-production. Orchestral instruments were exploited in unusual registers and in still more unusual combinations. As an ex-

treme example of overloaded orchestration may be cited Schönberg's *Gurrelieder*, scored for six solo voices, two choruses of 8 and 12 parts, respectively, and 114 different orchestral parts —altogether 140 distinct parts! In the employment of this huge apparatus, Schönberg defeats his very purpose and produces less startling and grotesque effects than Stravinsky does in his *Histoire du Soldat*, scored for an absurdly inadequate orchestra of one violin, one clarinet, one bassoon, one cornet, one trombone, and several drums.

The outbreak of the World War created conditions exceedingly favorable to the spread of Futurism, especially in Europe. It happened that Impressionism had already made great headway in Russia, England, and the Latin countries, whereas in Germany and Austria, the traditions of the classic and romantic masters had proved an effective check against the new influence. With German music banished, or at least considerably curtailed, in all countries politically arrayed against Germany, the Impressionists assumed undisputed leadership, and in their wake the Futurists developed such an active campaign that in a very short time they succeeded to the dominating position. Debussy, who until two or three years before his death (1918) had been acknowledged leader of the Radicals or Ultramodernists, was deposed as too conservative, and his place was taken by the Futurists Scriabin and Stravinsky. The Futurists now became the Ultramodernists, while the Impressionists were relegated to the rank of mere Modernists.

In Germany and Austria, the new gospel began to spread, and Schönberg, whose partisans before then had made some futile attempts at recognition, suddenly found himself elevated to a place by the side of Scriabin and Stravinsky. As early as 1915, an Italian, Pratella, formulated the new futuristic creed, which may be summarized briefly as follows:

The classic and romantic composers have arbitrarily confined music within narrow, artificial bounds rendering all further development impossible. Hence, the necessity of a new music free from the "decayed" formalism of the past. This new music the modern composer can create by implicitly following the dictates of his personal will, that is, the impulse of the "futuristic equilibrium."

This programme was accepted by all Futurists, irrespective of nationality, with the same result as in the case of the Impressionists, that all traces of nationality and individuality were completely obliterated.

After the War, the new movement continued throughout Europe with unabated vigor. A host of writers now appeared who effectively aided the composers, and in almost every country were established periodicals devoted exclusively to the cause of Futurism. Theorists wrote books formulating new systems of acoustics and esthetics to explain the new music and a special *Dictionary of Modern Music and Musicians* (1924) appeared, giving exhaustive information regarding the aims of modernism, together with a formidable array of biographical and appreciative sketches of all modernistic musicians born since 1880. Through these persistent and systematic efforts, a new public was recruited, sufficiently numerous to insure the success of a futuristic festival held in Salzburg in August, 1922. The immediate result of this festival was the formation of the International

Society for Contemporary Music (I. S. C. M.), with headquarters in London, for the purpose of spreading the new cult by means of annual festivals. At the first official festival, which took place according to schedule at Salzburg in August, 1923, 35 composers of 14 different nationalities were represented on the programme. Successive festivals were held at Prague (1924), Venice (1925), Zurich (1926), Frankfurt (1927), Siena (1928), and Geneva (1929). In 1929 there were 20 national sections in as many countries, including the United States.

It must not be inferred from all this, however, that the Modernists have succeeded in sweeping away all the music of the past. Throughout the musical world, the programmes of organizations and individual artists still show a vast preponderance of the works of recognized masters. The recent Beethoven and Schubert centennial celebrations gave unmistakable evidence how securely these masters are entrenched in the affections of all lovers of music. Then, there are still living among us a few eminent composers of an older generation who have kept themselves entirely free from any modernistic influence. This is true especially of the greatest of them, Richard Strauss, who thirty years ago was regarded as the "modernist" par excellence, in the same sense as Beethoven, Chopin, Schumann, and Wagner had been the "modernists" of their time; but what was called "modernism" in those days has nothing in common with the Modernism of today. The innovators of the last century, including even the impressionist, Debussy, willingly acknowledged their indebtedness to their predecessors, on whose foundations they continued the natural process of evolution; whereas, the present Modernists absolutely repudiate the art of the past. Strauss, the last of the great innovators, recognizes these facts and, for that reason, he is the implacable and outspoken enemy of all modernistic tendencies. Unfortunately, in his case, his inspiration seems to have died with the close of the last century (*Ein Heldenleben*, 1899), for none of the works written in the present century rises to the high level of his great symphonic poems. Whatever may be the cause of this decline, the same eclipse of creative power, dating from the same period, is noticeable in the works of other eminent composers now dead, Bruch, Saint-Saëns, Grieg, Massenet, Mahler, Reger, and Puccini, and also in those of Bruneau, Sinding, Elgar, and Sibelius, who are still living and writing.

Quite different and unique is the case of Rachmaninov (born in 1873), whose development has taken place mainly within the present century. Here, we have the only composer of great talent and pronounced individuality who, amidst most unfavorable conditions, goes his solitary way, develops and proves conclusively that, in the hands of a master, the classic and romantic forms are still capable of new and vital content. Then suddenly, without having given any indication of declining powers, he deserted the career of the creative artist for that of the virtuoso (1916). For 10 years, his muse was silent. When, in 1926, he gave the world his fourth piano concerto and the Russian choruses with orchestra, he showed that the divine fire is still burning within him.

In the musical development of the United States, Futurism played a secondary rôle. Futuristic tendencies, it must be admitted, were

quite noticeable among the younger American composers; but as yet, with a few exceptions, such as Ornstein, Sowerby, Hanson, Griffes, Cowell, and Whithorne, these manifestations avoided the furthest extremes and could still be regarded as advanced Impressionism. The chief reason why the influence of these composers on the public taste was negligible is the conservative attitude of the general public and of our great musical institutions, whose programmes, in the main, were still drawn from the works of recognized masters. While Impressionists had frequent hearings, Futurists were represented but sparingly, and only very rarely by extreme works. Of the musical centres, New York, the most important, is also the most conservative. Bach, Beethoven, Schubert, Brahms, Wagner, and Tchaikovsky still held undisputed sway, and despite determined efforts on the part of certain conductors, the New York public had not yet become convinced of the merits of Bruckner, Mahler, or Reger. This state of affairs led a small group of Futurists to establish, in 1921, the International Composers' Guild for the purpose of producing exclusively works of extreme tendencies, because "the standard symphony orchestras present only the most timid and anæmic of contemporary productions, leaving absolutely unheard the composers who represent the true spirit of our time."

In spite of very active and noisy propaganda, this group made few converts and the works produced at their special concerts did not find their way to the programmes of our recognized institutions. The organization was dissolved in 1927, but before that date two other societies with similar aims were established, and since then, Philadelphia, San Francisco, and Chicago have special societies for the propagation of Modernism. Although, since the beginning of the century, there had arisen in all parts of the United States numerous composers whose efforts had been duly recognized and encouraged by the leading orchestras and choral societies, they had not succeeded in reaching their common goal, the creation of a national school of music that should be recognized as typically American. Numerous and earnest attempts to force such a consummation by means of prizes, competitions, and special organizations producing exclusively works of native composers had not yielded the expected results. Nevertheless, the efforts put forth by this generation of composers were by no means futile; they were preparing the soil from which, at some future day, will spring the longed-for national art. As a natural consequence of the War, a vast number of the world's most famous interpretative artists sought and found success in extended tours of the United States. The presence of so many celebrities at the same time compelled managers to extend the field of operation, so that even smaller towns were visited, with the result that interest was stimulated throughout the country. Tangible proof of this new interest is found in the large number of newly established musical organizations of all kinds in towns which had formerly never considered such institutions a necessity.

Chamber Music. The widespread interest in chamber music throughout the United States during the decade furnishes conclusive evidence of the steadily growing appreciation of the best music. In all parts of the country numerous new organizations not only had been formed but also successfully maintained themselves. The

most notable event was the establishment of the annual Berkshire Festival, which was inaugurated Sept. 16-18, 1918. During the summer of 1917, Mrs. F. S. Coolidge began the erection on South Mountain, near Pittsfield, Mass., of the Temple of Music, a small concert-hall with a seating capacity of 500, to be devoted exclusively to the performance of chamber music. At the same time, she offered a prize of \$1000 for the best string quartet to be performed at the inaugural festival. Not less than 82 manuscripts, many from European composers, were submitted. After the success of the first festival, the \$1000 prize was made a regular feature. The programmes of the festivals are given by famous chamber-music organizations from all parts of the Union.

On two occasions, European quartets participated, the London String Quartet (1920) and the Stuttgarter Streichquartett (1922). The programmes offered were remarkable for variety and catholicity of taste, favoring no nation and no period, and ranging from Bach to the Moderns of the day. At the conclusion of the festival of 1922, announcement was made that the cash prize thereafter would be awarded biennially in the even years. In the odd years, new works were to be commissioned from prominent composers. The first composers to be honored with such commissions were Eugene Goossens (string sextet) and Rebecca Clarke (*Rhapsody*, for 'cello and piano), both performed at the festival of 1923. The list of prize winners was as follows: 1918, Tadeus Iaecki, string quartet; 1919, Ernest Bloch, suite for viola and piano; 1920, Francesco Malipiero, string quartet; 1921, H. Waldo Warner, piano trio; 1922, Leo Weiner, string quartet; 1924, Wallingford Riegger, *La Belle Dame Sans Merci*, for vocal quartet and chamber orchestra. In 1925 the festival was transferred to Washington and the name was changed to The Washington Chamber Music Festival. The time also was changed from September to April. In 1926 the \$1000 prize was awarded for the last time, Albert Huybrechts being the winner with a violin sonata. The poor quality of scores submitted led to the withdrawal of the prize.

An event that should not pass unrecorded is the dissolution of the famous Kneisel Quartet, which played its last concerts at Boston (Mar. 13, 1917) and New York (April 3). Founded in 1886, with Franz Kneisel, Otto Roth, Louis Svecenski, and Fritz Giese as its original members, it played 32 consecutive seasons in Boston and 25 in New York, besides making numerous tours of the United States and two of Europe. Its influence in practically creating and then cultivating taste for chamber music in America can scarcely be overestimated. For many years, it had enjoyed the reputation of one of the finest quartets in the world. Another world-famous organization, the Flonzaley Quartet, of New York, was disbanded after a most distinguished career of 25 years, the last concert being given in New York on Mar. 17, 1929. The original members were Adolfo Betti, Alfred Pochon, Ugo Ara, and Ivan d'Archambeau. The only changes in the membership occurred in 1917, when Ara was succeeded by Louis Bailly, and in 1924, when the latter's place was taken by Félicien d'Archambeau.

Community Music. Community music, at least as the term has come to be understood, was a direct result of the War. Previously,

there had existed, especially in Philadelphia and Chicago, isolated associations of factory workers organized into choral societies, some of which had attained sufficient proficiency to appear in public concerts. During the War, the soldiers, under regular leaders, were trained in choral singing, and the practice developed a genuine liking for music. Many ex-soldiers, after return to civil life, communicated the enthusiasm aroused in them by the camp songs to their fellow workers, with the result that in an incredibly short time employees of the larger companies in many industrial centres banded together for the cultivation of singing. Community choruses sprang up even in the smaller towns and villages throughout the country. The interest in music was not confined to singing, it immediately embraced the field of instrumental music, and numerous amateur orchestras and bands were established. By the end of 1920, the Bethlehem steel workers had recruited from among their own numbers not only a large chorus but also a complete symphony orchestra of almost 100 players. In the same year, the employees of the Federal Reserve Bank in New York gave a complete stage performance of *The Bohemian Girl* without the assistance of an outsider even in the principal rôles or orchestra. In some of the larger cities, where musical appreciation naturally had been spread before the War, the new movement led to the establishment of community opera (Washington, Philadelphia, St. Louis, Cincinnati). In 1920 New York celebrated its first Music Week (February 1-7), when all musical organizations, churches, hotels, theatres, and many individuals combined to bring music, in some form or other, home to everybody. At the Grand Central Palace, an exhibition of musical instruments was held throughout the entire week, with lectures and recitals. The interest aroused was so general that Music Week was made a regular annual institution, and a permanent committee of eminent musicians was appointed. The example was followed immediately by almost all neighboring communities, who had their Music Week before the end of the year. Within three years, the idea had been adopted by the entire country. This widespread interest in music induced several municipalities to appropriate public funds for furthering various musical projects. Baltimore established a special department of Municipal Music, St. Louis a municipally subventioned summer opera, Chicago and Philadelphia municipal symphony orchestras, etc. In New York, a movement was proposed in 1924 for the erection of a municipal conservatory, and the Musical Alliance of the United States had launched a movement for the establishment of a ministry of fine arts and a national conservatory in Washington.

Festivals. After the sudden interruption of the performances in the summer of 1914, the theatre dedicated to Wagner in Bayreuth remained closed for 10 years. During 1923 Siegfried Wagner gave concerts in many German cities, raising funds for the restoration of the theatre and the resumption of the performances. For the same purpose, he made a concert tour of the United States early in 1924. In the summer of 1924, the festival was resumed (July 22-August 20) with performances of the *Ring* dramas, *Meistersinger*, and *Parafal*. After 1914 the chorus of the Bethlehem (Pa.) Bach Festivals was gradually augmented, until in 1924

it numbered 250. Up to 1920 the programmes had been selected exclusively from the choral works of Bach, but in that year instrumental works were included. The innovation was received with favor and was adopted as a fixed policy. In 1917 the chorus participated in a Bach-Beethoven festival in New York arranged by the Philharmonic Society, and in the following year in a Bach-Wagner festival of the Symphony Society.

Albert A. Stanley, conductor of the Ann Arbor festivals since their inception (1893), resigned in 1921 and was succeeded by Earle V. Moore. An annual festival lasting four days was founded in Newark in 1915 by Mortimer C. Wiske and conducted by him thereafter. At the North Shore Festival in Evanston, Ill., a prize of \$1000 was established in 1921. It was to be awarded annually for the best orchestral score submitted by an American composer, the successful work to have its first performance at the festival and then to be included in one of the regular concerts of the Chicago Symphony Orchestra during the following winter. The winners were Camille Zeckwer with *Jade Butterflies* (1922), Felix Borowski with *Youth* (1923), Charles M. Loeffler with *Memoirs of Childhood* (1924), Herman H. Wetzler with *St. Francis of Assisi* (1925), and Edward Collins with *A Tragic Overture* (1926). After that, the prize was discontinued.

For the first time in its history, the annual festival at Worcester, Mass., was omitted in 1918, on account of an epidemic of influenza that swept the Eastern States in the fall of that year. There was no festival in 1922, because the time was changed from September to April. Arthur Mees resigned as conductor in 1919 and was succeeded by Nelson P. Coffin, who died shortly before the festival of 1923. The latter was under the direction of Arthur J. Bassett and J. Vernon Butler. In 1924 Henry Hadley conducted the festival, and in 1925 Albert Stoessel was elected permanent conductor.

In 1927 William R. Chapman, founder, and for thirty years conductor, of the Maine Festival, resigned and was succeeded by Albert Sprague. In 1924 the San Francisco Festival, under the direction of Alfred Hertz, was established, and in the following year the Westchester County Festival, was held at White Plains, under Albert Stoessel. Both immediately took their rank among the important annual festivals.

Opera. The recent history of Opera, since 1914, is a record of feverish activity practically barren of artistic results. Of the enormous number of new works produced throughout the world, it would be difficult to enumerate a meagre half-dozen that achieved such emphatic or continued success as to promise a permanent addition to the standard repertory. In the vast majority of cases, an opera has its première, followed by a few repetitions, and is then consigned to the limbo of forgotten things. The following list gives a fairly complete view of the more important dramatic composers and their works.

Eugen d'Albert. *Die toten Augen* (1916); *Der Stier von Olvera* (1918); *Die Revolutionshochzeit* (1919); *Sirocco* (1921); *Mareken von Nymwegen* (1923); and *Der Golem* (1926).—Franco Alfano. *Leggenda di Sakuntala* (1921) and *Madonna Impera* (1927).—Alban Berg; *Wozzeck* (1926).—Julius Bittner. *Die Kohlweiberin* (1921); *Der Bergsee* (new version, 1922);

Das Rosengärtlein (1924; new version, 1926); and *Mondnacht* (1928).—Arrigo Boito; *Nerone* (posth., 1924).—Rutland Boughton; *The Immortal Hour* (1914); *The Birth of Arthur and the Round Table* (1920); *Alkestis* (1922); *Bethlehem* (1923); and *The Queen of Cornwall* (1924).—Walter Braunfels; *Die Vogel* (1920) and *Don Gil von den grünen Hosen* (1924).—Alfred Bruneau; *Le Roi Candaule* (1920); *Le Jardin du Paradis* (1921); *Angelo, tyran de Padoue* (1928).—Ferruccio Busoni; *Arlecchino* (1918); *Doktor Faust* (posth., 1925).—Frederick Delius; *Fennimore und Gerda* (1919).—Ernst von Dohnányi; *Der Turm des Wajewoden* (1922) and *Der Tenor* (1929).—Henri Février; *Ghismonda* (1919); *La damnation de Blanche-fleur* (1920); and *L'île désenchantée* (1925).—Alberto Franchetti; *Giove a Pompei*, (with U. Giordano, 1921) and *Glauro* (1928).—Umberto Giordano; *Giove a Pompei*, (with A. Franchetti, 1921); *La Cena delle Beffe* (1924); and *Il Rè* (1929).—Eugene Goossens; *Judith* (1929).—Enrique Granados; *Goyescas* (1916).—Paul Gnaner; *Schirmer und Gertraude* (1920) and *Hannelcs Himmelfahrt* (1926).—Reynaldo Hahn; *Nausicaa* (1919) and *La Colombe de Bouddha* (1921).—Paul Hindemith; *Cardillac* (1926).—Joseph Holbrook; *Brownen* (1928).—Gustave Holst; *The Perfect Fool* (1923); *Savari* (1923); and *At the Boar's Head* (1925).—Engelbert Humperdinck; *Gaudeamus* (1919).—Georges Hue; *Dans l'Ombre de la Cathédrale* (1921).—Leos Janáček; *The Adventures of Mr. Bruck* (1920); *Katya Kabanova* (1921); *The Sly Little Vixen* (1924); *Sarka* (1925).—Theodor Kutzer-Ober; *The Makropoulos Case* (1926); and *The House of the Dead* (posth., 1929).—Hugo Kaun; *Der Fremde* (1920) and *Macnandra* (1925).—Wilhelm Kienzl; *Das Testament* (1916) and *Hassan der Schwärmer* (1924).—Erich Korngold; *Violanta* and *Der Ring des Polykrates* (1916); *Die tote Stadt* (1920); and *Das Wunder der Helene* (1927).—Ernst Krenek; *Orpheus* (1926); *Johnny spielt auf* (1927); *Der Diktator*; *Die Ehre der Nation* [or *Der Meisterbäcker*] and *Das geheime Königreich* (1928).—Gino Marinuzzi; *Jacqueline* (1918).—Pietro Mascagni; *Lodoletta* (1917) and *Il piccolo Marat* (1921).—André Messager; *Monsieur Beaucaire* (1919).—Italo Montemezzi; *La Nave* (1918).—Hans Pfitzner; *Palestrina* (1917) and *Christoffel* (1921).—Riccardo Piccini; *Mangiagliani Basti e Bole* (1927).—Gabriel Pierné; *La Cypresse* (1919) and *Sophie Arnould* (1927).—Ildemando Pizzetti; *Debora e Jacle* (1922) and *Fra Giordano* (1928).—Giacomo Puccini; *La Rondine* (1917); *Il Tabarro*, *Suor Angelica* and *Gianhi Schicchi* (1918); and *Turandot* (posth., 1926).—Maurice Ravel; *L'Enfant et les Sortilèges* (1925).—Ottorino Respighi; *Belfagor* (1923) and *La Campana sommersa* (1927).—Primo Riccitelli; *I Compagnacci* (1923).—Victor de Sabata; *Il Macigno* (1917) and *Insustata* (1929).—Max Schillings; *Mona Lisa* (1915).—Othmar Schoeck; *Erwin und Elmire* (1916); *Don Ranudo* (1919); *Venus* (1922); and *Penthesilea* (1927; rev. version, 1928).—Franz Schreker; *Die Gezeichneten* (1918); *Der Schatzgraber* (1920); *Isrelohe* (1924); and *Der singende Teufel* (1928).—Antonio Smareglia; *Pittori fiamminghi* (1928).—Richard Strauss; *Arriadne auf Naxos* (rev. version, 1916); *Die Frau ohne Schatten* (1919); *Intermezzo* (1924); and *Die ägyptische Helena* (1928).—Donald Tovey; *The Bride of Iphigenia* (1929).—Siegfried Wagner; *Schwarzwälder*

reich and *Sonnenflammen* (1918) and *Der Schmied von Marenburg* (1923).—Felix Weingartner: *Dame Kobold* (1916) and *Meister Andrea* and *Die Dorfschule* (1920).—Vaughan Williams: *The Shepherd of the Delectable Mountains* (1922); *Hugh the Drover* (1924); and *Sir John in Love* (1929).—Ermanno Wolf-Ferrari: *Gli Amanti sposi* (1925; in German as *Das Liebesband der Marchesa*, 1926); *Veste di Cielo* (1927); *Sly* (1927); and *Der Schlafer erwacht* (1928).—Riccardo Zandonai: *La Via della Finestra* (1919); *Giulietta e Romeo* (1922); *I Cavalieri di Ekebù* (1925); and *Giuliano* (1928).

In spite of the fact that in the United States opera received a large share of public attention, New York and Chicago until quite recently were still the only cities supporting a permanent operatic institution. Other cities were dependent on short visits from traveling companies, some of which, especially the San Carlo Opera Company and the Society of American Singers, were notable for the excellence of their ensemble. The taste of the general public showed a decided preference for the standard works, so that the production of novelties was left almost exclusively to the two permanent organizations. Neither of these institutions was fortunate with new works; not one of their novelties maintained itself in the repertoire. Quite recently, there were established in Philadelphia two operatic companies that give promise of becoming really permanent institutions, the Philadelphia Civic Opera (1924) and the Pennsylvania Grand Opera Company (1926). Both companies have the necessary guarantee fund to cover the inevitable deficit and a season of sufficient length to insure adequate preparation of new works. Thus, the Civic Opera gave the American premieres of Strauss, *Feuersnot*, and Gluck, *Mais-komgin* (1927), and of Strauss, *Ariadne auf Naxos* (1928); while the Pennsylvania Opera brought out for the first time in America Mus-sorgsky, *Chovantchina* (1928).

Chicago Opera Association. After the death of the general manager, Cleofonte Campanini (1919), his duties were divided between H. M. Johnson and Gino Marinuzzi, as executive and artistic directors, respectively. Complications arising from this dual directorship led, early in 1921, to the appointment of Mary Garden as sole director. Under her management, the friction became even more acute, and a deficit of \$800,000 at the end of the season brought about the dissolution of the company (1922), after 12 years of splendid artistic achievement. Immediately, the Chicago Civic Opera Company, with Samuel Insull as president, was organized and acquired all the properties and practically the entire personnel of its predecessor. While there was no change in regard to artistic policies, a radical departure in administration was inaugurated by vesting the executive power in the finance committee rather than in a single individual. Giorgio Polacco was made artistic director. The closing performance of the season 1928-29 (*Roméo et Juliette*, Jan. 26) was also the last performance given in the Auditorium, which had been the home of the Chicago Opera Company since its beginning in 1910. In the fall of 1929, the company inaugurated its own magnificent new home.

During the War, the works of Wagner were excluded from the repertoire. In 1920 *Lohengrin* was restored, in an English version, and was followed by *Die Walküre* (1921). After that,

these and other works were sung again in the original German. During 1918-22 the regular season included a four weeks' visit to New York. The year 1922 is memorable for a trans-continental tour (January-April), which was as brilliant artistically as it proved disastrous financially. Three operas by foreign composers had their world première in Chicago: Lazzari, *Le Sauteriot* (1918); Février, *Ghismonda* (1919); and Prokofiev, *Love for Three Oranges* (1921). Native composers were encouraged by the production of Buchhalter, *A Lover's Knot* (1916); Hadley, *Azora* (1917); Nevin, *The Daughter of the Forest* (1918); De Koven, *Rip Van Winkle* (1920); Stearns, *The Snow Bird* (1923); Harling, *A Light from St. Agnes* (1925); and Cadman, *The Witch of Salem* (1926). Two ballets by American composers were given in 1919: Borowski, *Boudour* and Carpenter, *The Birthday of the Infanta*. The following foreign works were given for the first time in the United States. Ginecchi, *Cassandra* (1914); Saint-Saëns, *Déjanire* (1915); Massenet, *Cléopâtre* (1916); Gunsbourg, *Le Vieil Aigle* (1917); Catalani, *Loreley* and Montemezzi, *La Nave* (1919); Ravel, *L'Heure Espagnole*, Messager, *Madame Chrysan-thème*, Erlanger, *Aphrodite*, Marinuzzi, *Jacquerie*, and Leoncavallo, *Edipo Rè* (1920); Grolez, *La Fête à Robinson* (1922); Franchetti, *Namako San* and Alfano, *Risurrezione* (1925); and Honegger, *Judith* (1927).

Metropolitan Opera House (New York). The last two decades at the Metropolitan Opera House, under Giulio Gatti-Casazza as general manager, was a period of unexampled prosperity. There was no annual deficit to be met. Year by year the number of subscribers increased. No promises were made that were not strictly fulfilled. During the period of the War, the works of Wagner and Strauss were temporarily withdrawn, but, beginning in 1920, they were restored, one after the other, to the repertoire. The policy of producing every season a work by an American composer, inaugurated in 1910, was maintained until 1920, except for the years 1915 and 1916. Thus, the following operas were brought out: De Koven, *The Canterbury Pilgrims* (1917); Cadman, *Shaneuws* (1918); Breil, *The Legend*, and Hugo, *The Temple Dancer* (1919), and Hadley, *Cleopatra's Night* (1920). A ballet by an American, Gilbert, *The Dance in Place Congo*, was performed in 1918. Four world premières of works by foreign composers are to be recorded: Giordano, *Madame Sans Gêne* (1915); Granados, *Goyescas* (1916); Puccini, *Il Tabarro*, *Suor Angelica* and *Gianni Schicchi* (1918); Wolff, *L'Oiseau Bleu* (1919). Following are the foreign operas given their American Premières: Montemezzi, *L'Amore dei tre Rè*, Charpentier, *Juhen*, and Wolf-Ferrari, *L'Amore Medico* (1914); Leoni, *L'Oracolo* and Borodin, *Prince Igor* (1915); Bizet, *Les Pêcheurs des Perles*, Gluck, *Iphigénie auf Tauris*, and Zandonai, *Francesca da Rimini* (1916); Rahaud, *Marouf* (1917); Liszt, *The Legend of St. Elizabeth*, and Mascagni's *Lodoletta* (1918); Leroux, *La Reine Flammette* (1919); Leoncavallo, *Zaza*, and Tchaikovsky, *Eugen Oniegin* (1920); Weiss, *The Polish Jew*, and Korngold, *Die tote Stadt* (1921); Mozart, *Così Fan Tutte* (1922); Vit-tadini, *Anima Allegra*, and Schillings, *Mona Lisa* (1923); Riccitelli, *Compagnacci*, and Jan-áček, *Jenufa* (1924); Montemezzi, *Giovanni Gallurese* (1925); Giordano, *La Cena delle Beffe*,

de Falla, *La Vida breve*, Stravinsky, *Le Rossignol*, and Puccini, *Turandot* (1920); Taylor, *The King's Henchman*, Casella, *La Giara*, and Korngold, *Violanta* (1927); Alfano, *Madonna Imperia*, Puccini, *La Rondine*, Respighi, *La Campana sommersa*, and Strauss, *Die ägyptische Helena* (1928); Krenek, *Johnny spielt auf*, Pizzetti, *Fra Gherardo*, and Rimsky-Korsakov, *Sadko* (1929). The following operas, produced by other organizations than the Chicago and Metropolitan companies, complete the list of American premières since 1914: 1914, Mozart, *Bastien et Bastienne* (New York); 1915, Parker, *Fairyland* (Los Angeles); 1916, Moniuszko's *Verbum Nobile* (Philadelphia) and Mozart's *The Impresario* (New York); 1917, Donizetti, *Campanella di Notte*, Pergolesi, *La Scra Padrona*, Gounod, *Le Médecin malgré lui* (all in New York); 1918, Hadley, *Bianca* (New York); 1919, Vives, *Maruca* and *Los Bohemios* and Messenger, *Monsieur Beaucaire* (both in New York); 1922, Dargomyzhsky, *Russalka* and Rimsky-Korsakov, *Tsarshaya Nemesta* (San Francisco); 1923, Moniuszko, *Halka*, d'Albert, *Die Toten Augen*, and Kienzl, *Der Evangelmann* (all in Chicago); 1924, Fourdrain, *La Légende du Point d'Argentan* (Ravina Park, Chicago); 1926, Monteverdi, *L'Incoronazione di Poppea* (Northampton); 1927, Korngold, *Der Schneemann* (Seattle), Handel, *Julius Caesar* (Northampton, Mass.); 1928, Vaughan Williams, *Hugh the Drover* (Washington), Monteverdi, *Combattimento di Tancredi e Clorinda*, and Handel, *Xerxes* (both at Northampton); 1929, Monteverdi, *Orfeo*, and Handel, *Apollo e Dafne* (both at Northampton).

Orchestras. While in the United States the opera formerly engaged the principal interest of the general public, the period after 1914 wrought a change in favor of orchestral music. All the older organizations vastly increased the number of their concerts, so that the orchestral season extended from October to May. In 1914 the Boston Symphony Orchestra had no rival in this country. Even then, it was no secret that the perfection of its ensemble was due to daily rehearsing. Unfortunately, no other orchestra at that time had a patron like Colonel Higginson who would bear the enormous expense involved. The longer musical season provided the natural solution of the problem, so that in 1924 we could boast not one but several premier orchestras unsurpassed anywhere in the world. Daily rehearsals had produced the identical result in all cases. Visits of orchestras to other cities and exchange of conductors had engendered a spirit of rivalry, which makes for supreme efficiency. The soloist, formerly an indispensable attraction at every symphony concert, had come to occupy a secondary position. In 1912 the Boston Symphony Orchestra, under Dr. Muck, made the first successful experiment in giving concerts without the aid of soloists. From that time, the practice became so common that in 1924 soloists were engaged for perhaps not more than half of the season's concerts. This widespread and intelligent interest in the music itself, rather than in the executant, had created a new, collective method of subventioning orchestras. The cost of maintaining a first-class organization is so heavy that the income from admissions is in every case insufficient to meet expenses. The burden of the inevitable annual deficit, formerly borne by some wealthy patron especially interested (e.g., Higginson, Carnegie,

Flagler), was being assumed by several guarantors, each contributing a relatively small amount. In the latter years, more than one of our premier orchestras was threatened with dissolution because of inability to meet the high cost of maintenance. In every case, a sufficient number of public-spirited citizens came forward to avert a serious loss to the community; and when one considers that, from the conclusion of the War, every year new symphony orchestras were established throughout the country, one cannot but be impressed with the development of public taste.

Boston Symphony Orchestra. The refusal of Dr. Muck, in the fall of 1917, to play the national anthem before the concert, was the beginning of a period of storm and stress. He resigned at the end of the season. At the same time, Colonel Higginson severed his relations with the orchestra, delegating his powers and responsibilities to a board of nine directors. More than 20 German players, who had failed to take out naturalization papers, were dismissed. In 1918-19 Henri Rabaud was the conductor; under him the orchestra rapidly deteriorated. When Pierre Monteux, in the fall of 1919, assumed control, he found a demoralized body of men, many of whom rebelled and deserted before the end of the season, so that out of a total of 100 performers only 67 remained for the final concert. In addition, a deficit of \$131,000 brought the organization to the verge of dissolution (April, 1920). An appeal by the directors secured not only this amount but also a guarantee fund, pledged by 200 contributors, for five years. With a thoroughly reorganized and practically new orchestra, Monteux began the difficult task of regaining the lost prestige. When Sergei Kussevitsky became conductor in 1924, he found that his predecessor's efforts had been crowned with success. With Kussevitsky's pronounced sympathy with modernistic music, the programmes immediately reflected his personal taste. Since 1926 it has become a fixed custom to devote one-half of each programme exclusively to the Moderns. The policy of inviting guest-conductors for a few concerts was not adopted until 1923, when Bruno Walter appeared. Those that have thus been honored since then are Georg Schneevogt (1924), Michael Press and Eugene Goossens (1926), Ottorino Respighi (1927), and Maurice Ravel and Sir Thomas Beecham (1928).

Chicago Symphony Orchestra. In 1914 a pension fund was established through the gift of \$100,000 by Mrs. E. S. Coolidge, who donated the same amount also the next year. In 1923 Clyde M. Carr bequeathed to the organization \$1,000,000 to be used at the discretion of the trustees. In the spring of 1923, a number of music lovers saved the orchestra from disbanding by assuming responsibility for a considerable increase in the salary of the men demanded by the musical union. The same difficulties arose every successive year until the climax was reached in 1927, when the orchestra was actually disbanded. This brought about immediate action by a number of public-spirited citizens, through whose efforts the orchestra was placed on a secure financial basis and could be reassembled in time for the opening of the fall season.

Cincinnati Symphony Orchestra. After the internment of the conductor, Dr. Kunwald (January, 1918), the remaining concerts of the season were given under guest-conductors. In

1918-22 Eugène Ysaÿe was conductor. His successor was Fritz Reiner. In 1925 the series of regular home concerts was increased from 24 to 40.

Cleveland Symphony Orchestra. Under the auspices of the Musical Arts Association, this orchestra of 85 performers, under Nikolai Sokolov, was established in 1918 and soon was recognized as one of the leading symphony orchestras of the country. On the occasion of its tenth anniversary, Mr. and Mrs. John L. Severance donated to the board of directors a million dollars, on condition that another million and a half be raised by popular subscription, toward the erection of a permanent hall and the establishment of an endowment fund to defray the annual deficit.

Detroit Symphony Orchestra. This body was organized in 1914 by Weston Gales, who directed the concerts until 1918, when Ossip Gabrilowitsch became his successor. Under him, the orchestra was increased to 86 performers and the regular season lengthened, until, from 1925 on, it extended over 28 weeks. Besides the series of regular concerts, there is also a series of 24 Sunday afternoon concerts, under the direction of the assistant conductor, Victor Kolar, who was appointed in 1919. In the same year, the organization inaugurated its own permanent hall.

Minneapolis Symphony Orchestra. In 1922 Max Oberholfer resigned and was succeeded by Henri Verbrugghen. At the same time, the orchestra widened its field of activity by adding a series of 16 concerts in St. Paul, a series of 25 popular Sunday concerts and 5 educational concerts for young people.

National Symphony Orchestra. This organization was founded in New York in 1919 as the New Symphony Orchestra, under Edgar Varèse, for the exclusive production of futuristic works. The complete failure of the first concert (April 11) so alarmed the guarantors that they dismissed Varèse and engaged Bodanzky, who played only standard works at the remaining concerts. His success led to the incorporation of the orchestra as the National Symphony Orchestra, beginning its career in October, 1919. In the summer of 1920, it was engaged for the series of open-air concerts at the Stadium of the College of the City of New York, under Walter Rothwell as guest-conductor. As Bodanzky's duties at the Metropolitan Opera House did not allow him sufficient time, the directors engaged Mengelberg for the second half of the season (January-March, 1921). He made a sensational success and remained with the organization after its amalgamation with the Philharmonic Society.

New York Philharmonic Society. The amalgamation of the society with the National Symphony Orchestra in 1921 led to a complete reorganization. Many of the older men were retired on pension, the personnel was increased to 125 performers, and a new schedule for intensive rehearsals was adopted. Mengelberg was engaged as coördinate conductor with Stransky, the former directing the last half of the season, the latter the first half. In 1923 Stransky resigned and was succeeded by Willem Van Hoogstraten. From 1925 to 1927, Mengelberg and Wilhelm Furtwängler divided the season evenly between them, while Arturo Toscanini, Georges Enesco, and Fritz Reiner appeared as guest-conductors. In 1924 a series of 10 concerts for children, under Ernest Schelling

as conductor, became a permanent feature. In 1928, after the dissolution of the New York Symphony Orchestra, the board of directors was increased from 22 to 28 by the election of six former directors of the Symphony Society, the orchestra reorganized by retiring a number of the older members and replacing them with men from the disbanded organization, and the name was changed to The Philharmonic-Symphony Orchestra. Likewise, the season was lengthened from 23 to 28 weeks. For the first season (1928-29), Mengelberg remained as regular conductor for half the season, while the other half was under the direction of Walter Damrosch, Ossip Gabrilowitsch, Bernardino Molinari, and Arturo Toscanini. For 1929-30 Toscanini, Molinari, and Mengelberg were appointed as regular conductors.

From 1916 to 1920, William Humiston was associate conductor; after those years, the position was filled by Henry Hadley. During the summer of 1922, the entire orchestra was engaged for the open-air concerts at the Stadium; the first half of the series was led by Hadley, the second, by Van Hoogstraten. Since 1923 Van Hoogstraten has been principal conductor of the entire series with two or three guest-conductors assisting. With the proceeds of two festival concerts celebrating the eightieth anniversary of the foundation of the Society (April, 1922), a benefit fund was established for the members.

New York Symphony Orchestra. Under its regular conductor, Walter Damrosch, the orchestra made a most successful tour of France, Italy, Belgium, and England in May and June, 1920. In 1921 and 1922 Albert Coates directed several concerts as guest-conductor. Bruno Walter appeared in the same capacity in 1923-24, and Vladimir Golschmann in 1924. Other guests were Otto Klemperer (1926), Fritz Busch (1927), and Oskar Fried and Enrique Arbos (1928). In 1927 Damrosch, after 43 years of continuous service, retired as regular conductor. In 1928 the orchestra was dissolved, after it had just finished its fiftieth season.

Philadelphia Symphony Orchestra. In 1916 Edward Bok donated to the orchestra \$250,000 and pledged himself to pay any deficit for the next five years. In 1918 a regular series of five concerts in New York was established, the number of which was increased to 10 in 1921. During the absence of Leopold Stokowski as guest-conductor in Paris in 1923, his place was taken by Georges Enesco, while during his leave of absence in 1927-28 the orchestra was directed by Reiner, de Sabata, Mengelberg, Gabrilowitsch, Monteux, and Rodzinski. From 1926-29 Artur Rodzinski was assistant conductor.

St. Louis Symphony Orchestra. After the death of Max Zach, in 1921, the remaining concerts of the season were led by guest-conductors. From the fall of 1921, Rudolf Ganz was regular conductor until his resignation in 1927. Since then, a policy of guest-conductors has been in vogue.

Following is a list of the more important new symphony orchestras: Los Angeles Philh. O., Walter Rothwell 1920 till 1927; since then, Georg Schneevoigt; Portland Ore. S. O., Carl Denton till 1925; since then, Willem Van Hoogstraten; Nashville S. O., F. A. Henkel; Toledo S. O., Lewis Clement; 1921: Erie S. O., Henry Vincent; Buffalo S. O., Arnold Cornelissen; 1922: Syracuse S. O., William Berwald till 1924; since then, Vladimir Shavitch; Watertown S. O., Patrick

Conway; Salt Lake City Philh. O., Charles Shepard; Wichita S. O., P. H. Flath; 1923. Rochester Philh. O., Eugene Goossens and Albert Coates as guest-conductors till 1925; since then, Howard Hanson; Civic S. O. of Philadelphia, Vassili Leps; Atlantic City Philh. Soc., Louis Colmans; American National O. (New York), Howard Barlow; 1924· Huntington (Ind.) S. O., Rex Arlington; Sacramento Municipal S. O., Franz Dicks; Omaha S. O., Ernest Nordin; since 1925, Sandor Harmati; 1925: The Orchestral Society of Rome (N. Y.), F. B. Cowell; Pennsylvania S. O. of Philadelphia, Josef Pasternack; 1926· Clendale (Calif.) S. O., J. A. Myers; Washington S. O., Kurt Hetzel; Boston Philh. O., Ethel Leginska; Dallas S. O., Paul Van Katwijk, 1927; New Brunswick (N. J.) S. O., J. E. Newton; 1928: Skalski S. O., in Chicago, André Skalski; American Symphonic Ensemble in New York, a conductorless orchestra.

Mechanical Reproduction of Music. There is not the least doubt of the fact that the introduction and rapid perfection of the player-piano and the phonograph contributed in a large measure to the development of the public taste for better music. The former had been brought practically to perfection even before the War. This is true of the Welte-Mignon, Duo-Art, and Ampico reproducing pianos and organs, which differ from the earlier mechanical instruments in that they faithfully reproduce that subtle quality termed the individuality of the artist. On Dec. 10, 1918, the Chicago Symphony Orchestra performed Saint-Saens's concerto in G minor for piano and orchestra with Harold Bauer as soloist. The latter, however, was not actually present, but was represented by his Duo-Art record. At a concert of the New York Philharmonic Society (Apr. 23, 1919), the soloist, Leo Ornstein, sat motionless on the stage listening to his own reproduction of the first movement of Mendelssohn's *Concerto in G minor*, after which he took his seat at the instrument and played the remaining movements in person. These and many similar public demonstrations convinced music lovers of the extraordinary merit of the new invention, but the high cost of the reproducing apparatus, as well as of the perforated rolls, proved a serious obstacle in the way of making these improved automatic instruments universally popular. These records, however, are of incalculable value, because they preserve for posterity the actual art of the greatest pianists and organists, some of whom already have passed away, as Carreño, Essipov, Bloomfield-Zeisler, Reisenauer, Saint-Saens, Guilmant, and other well-known artists.

Just as these means of recording for piano and organ had been perfected, there arose a powerful rival in the phonograph, through the rapid and marvelous development of which it ultimately became possible to achieve the same artistic results, not only with the piano and organ, but in the entire field of vocal and instrumental music, and at a much lower cost.

It may be said, up to 1914, satisfactory records had been made only of solo voices or solo instruments. The accompaniment, whether for piano or orchestra, left much to be desired in regard to tonal quality, clearness, and proper balance with the solo part. Reproductions of choruses sounded blurred, while orchestral records failed to reproduce the timbre of the different instruments. Especially wonderful is the progress made since then, even with the old

acoustical method of recording, in the reproduction of orchestral masses, so that in the best records a practiced ear could detect such subtle differences in timbre as between an oboe and an English horn. The year 1925 wrought a complete revolution, when the new process of electrical recording made possible the absolutely perfect reproduction of all kinds of music, from the solo voice or instrument to the largest vocal or instrumental mass-effects. Until then, all attempts toward obtaining the genuine, full piano tone had failed, but the new process solved this vexing problem. Simultaneously with this advance in recording came an equally important advance in reproducing through the invention of the orthophonic phonograph. Several subsequent improvements affected only the details of mechanical operation (elimination of scratching, substitution of house-current for batteries, etc.). From the very beginning, tone-quality, tonal balance, differentiation of timbre, sound volume, and dynamic shading were perfect, so that further improvement in these respects seems impossible.

Almost from the day of its inception, broadcasting by radio became an important factor in the dissemination of good music. The first concert heard over the radio was broadcast by Station KDKA in Pittsburgh, on Nov. 3, 1920, and soon stations all over the country were broadcasting music. The beginning was made with dance music and popular songs of the day, but before long, in response to numerous requests, symphony concerts and entire operatic performances were broadcast. The demand for the better music rapidly assumed such proportions that managers, especially those of famous artists, fearing a decrease of attendance at concerts, inserted a clause in all contracts restraining their artists from giving their services gratis. Composers and publishers also began to demand payment of the usual fees on all works controlled by them. These demands the radio companies declared themselves unable to meet, as they derived no income whatever from the host of listeners. The result was that, during the last months of 1923, there was a decided dearth of good music transmitted by radio. The broadcasting companies, however, soon developed a new and very lucrative system of advertising by radio, which enabled them not only to maintain a regular staff of artists for serious concerts, but also to pay handsome fees for the services of world-famous artists. In 1927 Walter Damrosch resigned the conductorship of the New York Symphony Orchestra to accept the post as general musical director of the National Broadcasting Company, devoting his entire time to giving symphony concerts over the radio. Among the great symphony orchestras who regularly broadcast a certain number of their concerts are those of Boston, Cleveland, Detroit, Chicago, New York, Philadelphia, and San Francisco, while the Chicago Opera Company, during its regular season, has arranged for a certain night every week to put on the air an act or two of its regular performance.

MUSICAL RECORDS. See MUSIC, *Mechanical Reproduction*.

MUSIC WEEK. See MUSIC, *Community Music*.

MUSIL, mō'sil, ALOIS (1868—). A Czechoslovak Orientalist (see Vol. XVI). In 1914-15 he continued his explorations in the deserts of northern Arabia and southern Meso-

potamia, and in 1919 he became a professor in the University of Prague. The American Geographical Society published his accounts of his explorations, in English, in seven volumes (1926-28); *The Northern Hegâz; Arabia Deserta; The Middle Euphrates; Palmyrena; Northern Negd; The Manners and Customs of the Ruala Bedouins; and Topographical Itineraries of Exploration in Arabia and Mesopotamia*. He also wrote *Zur Zeitgeschichte von Arabien* (1918).

MUSSELLINI, mûs'sô-lî'nî, BENITO (1883-). An Italian statesman who was born at Predappio, near Forlì, and educated at the normal schools of Forlìmpopoli and the University of Lausanne (Switzerland). A Marxian socialist, he was expelled from Switzerland because of his propaganda in 1904, and later from Austria, where he aided Cesare Battisti in the editing of *Il Popolo* of Trent. He returned to Forlì, started *Lotta di Classe* (1911), and then edited *Avanti* in Milan (1912-14). A director of the Italian Communist Party, he was expelled from it in 1914 when he urged that Italy enter the World War against the Central Powers. He started the *Popolo d'Italia* the next year to spread his ideas, and fought in the War as a corporal in the *bersagliers* until February, 1917, when he was severely wounded, decorated, and later discharged. On Mar. 23, 1919, he founded the first "Fascio di Combattimento," later to be known collectively as the Fascisti, to suppress the wave of Bolshevism that was sweeping over the country. Many returning officers and soldiers rallied to his support, and by 1922 there were 4,000,000 Fascisti. Throughout 1922 conditions bordering on anarchy prevailed, due to the Fascist-Communist battle and the friction between the Fascists and the Government. At the Fascist congress at Naples (October 24), the party demanded that Mussolini head the government, whereupon the cabinet resigned and the King chose him Premier on Oct. 30, 1922. At first, his policies were conciliatory, his cabinet including members of the other parties. He soon concentrated power in the hands of the Fascist Party, however, himself becoming Minister of Foreign Affairs and of the Interior. By 1927 he had added the portfolios of war, marine, aviation and corporations, giving him seven of the 13 posts in the cabinet.

He changed the electoral law so that the majority party received two thirds of the seats in Parliament, thus assuring Fascist control of the government, suppressed the opposition press and organizations, socialism and freemasonry, and limited the right of free speech. On the other hand, he lessened direct taxes, made laboring conditions more reasonable, inspired the people to save, and everywhere insisted on efficient and punctual service, which transformed Italy into an up-to-date and prosperous state. In

foreign affairs, he occasionally aroused foreign criticism, as in his occupation of Corfu in 1923, but in general, he was active in making treaties of friendship and commerce, and enlarging Italy's influence in the countries around the Mediterranean.

On Feb. 11, 1929, he and Cardinal Gasparri, the Papal Secretary of State, signed a treaty settling the 59 year dispute between Italy and the Papacy, and ending the "imprisonment" of the Pope. The concordat was later ratified by both parties. It provided for the establishment of the Vatican City, as an independent territory, considered neutral and inviolable and governed solely by the Pope. On Sept. 12, 1929, he yielded seven of his nine cabinet posts, retaining the Premiership and the portfolio of Foreign Affairs. Mussolini wrote *Giovanni Huss, Trentino visto da un Socialista; Diario di guerra* (1920); *Druturna* (1924); *La nuova politica dell'Italia* (3 vols., 1925); *Il nuovo Stato unitario italiano* (1927); and *My Autobiography* (1928); published many volumes of his speeches, and edited, with Margherita Sarfatti, *Gerarchia*, a Fascist monthly in which he usually wrote the leaders. Consult *The Life of Benito Mussolini*, by Margherita Sarfatti (trans. 1925); *The Fascist Dictatorship in Italy*, by Gaetano Salvemini (1927); *Benito Mussolini—the Man*, by V. J. Bordeaux (1927); *Mussolini and the New Italy*, by Alexander Robertson (1928); and *Mussolini the Man of Destiny*, by Vittorio E. de Floriti (1928). See ITALY, History, and FASCISM.

MUZZEY, DAVID SAVILLE (1870-). An American historian and author, born at Lexington, Mass., and educated at Harvard University, Union Theological Seminary, New York and Columbia universities, and in Berlin and Paris. After serving as tutor in mathematics at Robert College in Constantinople for one year, he became a teacher of Latin and Greek in the Ethical Culture School of New York. In 1905 he was appointed head of the department of history at Barnard College and was successively associate, associate professor, and professor (1920-23). After 1923 he was graduate professor of American History at Columbia University. He was a member of several learned societies and wrote *Rise of the New Testament* (1900); *Spiritual Heroes* (1902); *Beginners' Latin Book* (1907); *American History* (1911); *State, Church, and School in France* (1911); *Life of Thomas Jefferson* (1918); *The United States of America* (1922-24); *History of the American People* (1927); *The American Adventure*, 2 vols. (1927).

N

NANKING INCIDENT. See CHINA, under *History*.
NANSEN, nän'sen, FRIDTJOF (1861-). A Norwegian Arctic explorer (see Vol. XVI). He was chairman of the Norwegian

Association for the League of Nations in 1918, and in 1920 he was asked by the Council of the League to investigate problems in connection with the repatriation of prisoners of war. On this subject, he prepared an exhaustive report and then supervised the work of returning 450,000 prisoners to their homes. From 1921 to 1923, he had general charge of the direction of relief for Russian refugees, and in 1921-23 was in charge of famine relief work in Russia, receiving the Nobel Peace Prize for this work (1922). The League of Nations again called on him to supervise its relief work among 1,500,000 Greek and Armenian refugees expelled from Asia Minor after the war between Greece and Turkey in 1922. In 1925 he was elected rector of St. Andrew's University, Scotland. He worked for international arbitration, and in 1927 became Norway's representative on the disarmament committee of the League of Nations. He visited the United States in 1928, where he announced plans for further explorations of the Arctic regions by dirigible. His later works include *Spitzbergen* (1922); *Sporting Days in Wild Norway* (1925); *Hunting and Adventure in the Arctic* (1925); *Adventure and Other Papers* (1927); and *Armenia and the Near East*, the result of his study of the Armenian problem for the League of Nations (1928).

NAPHTHA. See PETROLEUM.

NAPLES. The largest city and most important seaport of Italy. The population in 1928 was estimated to be 966,423. Under the Fascist regime, the aspect of the city has greatly changed. The squalor and poverty, characteristic of Naples for centuries, have been outwardly abolished, and slum sections are giving place to broad, new streets lined with lofty buildings of ferro-concrete. The old, picturesque quarter of San Lucia has vanished entirely. On the site of the old fish market is the Via Nazario Sauro, and a fine new thoroughfare, the Via Santa Lucia, is lined with modern shops. Ambitious building schemes have been put into execution to take care of the dispossessed tenants of the slum sections, and in the suburbs garden cities consisting almost entirely of workmen's dwellings are springing up. These improvements have been largely the result of the law passed in June, 1925, authorizing the Government to regulate the unification of various departments for the purpose of carrying out public works and of adopting measures for "the improvement of the economic, hygienic, and social condition of the south of Italy and the islands."

Vast port improvements have been undertaken in order that Naples might retain her title as the most important seaport of Italy. The programme which was inaugurated in 1924 included prolongation of the outer wall of the

S. Vincenzo mole and the construction of new docks for large transatlantic liners. In 1927, 8586 vessels of 9,071,731 tonnage entered the port, and 8597 vessels of 9,082,322 tonnage were cleared. In carrying out the Fascist programme of the development of electrical resources, industry has prospered. The Società Meridionale di Eletticità has undertaken harnessing the mountain streams of the Sila in Calabria, and a central station of 30,000 horse power has been established at Vigliena to furnish additional energy to Naples. Staple industries, such as hemp and cotton, have improved plants, and the manufacture of steel and silk has been revived.

The Biblioteca Nazionale, formerly housed in the Museo Nazionale, has been removed to the Royal Palace which in 1920 was presented to the nation. It contains 400,000 volumes, 8000 manuscripts, and many rare specimens of early German and Italian printing. The Lucchesi-Palli Library, consisting mainly of music and dramatic works, also has been installed in the palace. A gallery of modern art has been established in the reconstructed Castel Nuovo, the historic fortress of the Angevin and Aragonese dynasties. The nucleus of the collection, consisting of 39 pictures and 10 pieces of modern sculpture, was presented by King Victor Emanuel. In 1928 the municipality of Naples appropriated 2,000,000 lire so that the excavation of Herculaneum might be resumed.

NASHVILLE. The capital of Tennessee. The population rose from 110,364 in 1910 to 118,342 in 1920 and to 139,600 in 1928, by estimate of the Bureau of the Census. The area is 21.5 square miles. In 1924-27 the city, in cooperation with Davidson County and the State of Tennessee, erected a \$2,225,000 War Memorial. In addition to housing many State offices, this building serves as a museum of the Tennessee Historic Society and the Daughters of the Confederacy. It occupies two blocks in the centre of the city and is surrounded by two additional blocks which have been turned into a park. Between 1921 and 1925, an exact replica of the Parthenon at Athens (except in the material employed) was erected in Centennial Park, replacing the temporary structure which had been constructed for the Tennessee Centennial Exposition of 1897. The cost of the building was approximately \$2,500,000; the interior is being prepared to house an art gallery. Nashville is a city of diversified industries, leading the South in the manufacture of wheat products, stoves, shoes, furniture, lumber, rayon, and many other products. In 1925, 10,549 persons were employed in approximately 600 manufacturing establishments and received \$9,691,000 in wages; the value of products manufactured was \$79,331,000. Nashville prints more religious periodicals than any other city in the United States and is the leading printing centre of the South. Old Hickory, an industrial city of 12,000 persons, is located on the site of the powder plant erected by the United States government during the War. Nashville is important

as an educational centre, being known as "the Athens of the South." In 1928 it had 40 public schools and 38 universities, colleges, and preparatory schools, the latter group having combined assets of more than \$28,000,000. Bank clearings in 1928 amounted to \$1,199,465,000. The assessed valuation of property in 1927 was \$165,235,000; the net debt was \$14,831,000.

NATAL PROVINCE. See SOUTH AFRICA, UNION OF.

NATHAN, GEORGE JEAN (1882-). An American author and dramatic critic, born in Fort Wayne, Ind., and educated at Cornell University and the University of Bologna, Italy. He was dramatic critic, with Huneker, of *Puck* (1915-16), and of the *Smart Set Magazine* (1908-23). During 1914-23 he was editor of *Smart Set* with H. L. Mencken, and in 1924 he started with Mencken a new magazine, *The American Mercury*, of which he has been contributing editor since 1925. His knowledge of the French, German, and English stage, and his keen observation, perspicacity, and discriminating sense of humor, have made him one of the leaders in criticism in the United States. He has been an editorial contributor to the *London Daily Mail* and the *London Sunday Chronicle*. Some of his books are *The Eternal Mystery* (1913); *Another Book on the Theatre* (1916); *Bottoms Up* (1917); *Mr. George Jean Nathan Presents* (1917); *A Book Without a Title* (1918); *The Popular Theatre* (1918); *Comedians All* (1919); *Helio-gabalus*, with H. L. Mencken (1920); *The American Credo*, with H. L. Mencken (1920); *The Theatre, the Drama, the Girls* (1921); *The Critic and the Drama* (1922); *The World in Falseface* (1923); *Materia Critica* (1924); *The Autobiography of an Attitude* (1925); *The House of Satan* (1926); *The New American Credo* (1927); *Land of the Pilgrims' Pride* (1927); *Art of the Night* (1928), and *Monks are Monks* (1929).

NATHAN, ROBERT (1894-). An American author, born in New York City. He was educated in private schools in the United States and Switzerland and took graduate courses at Harvard. His published writings include *Peter Kundred* (1919); *Autumn* (1920); *Youth Grows Old* (1922); *The Puppet Master* (1923); *Jonah* (1925); *The Fiddler in Barly* (1926); *The Woodcutter's House* (1927); *The Bishop's Wife* (1928). He also composed songs and a sonata for the violin.

NATIONAL ACADEMY OF SCIENCES. A body of American scientists, incorporated in 1863, for the purpose of investigating, examining, experimenting in, and reporting on any subject of art, when called on by any department of the government. The activities of the Academy during the period from 1914 were varied and important. The National Research Council, with John J. Carty as chairman, was established in 1916 as a result of a movement to mobilize the nation's science for industrial progress and military efficiency. An investigation of the Panama Canal slides also was made in 1916. At the annual meeting at Johns Hopkins University in 1918, the principal subjects of discussion were technical, and pertained to chemistry, astronomy, medicine and other sciences. In the autumn of 1919, a meeting was held at Yale, and was addressed by W. M. Davis on the subject of four cliff islands in the coral seas; by C. B. Davenport and A. J. Love, on defects found in drafted men; and by John M. Clarke, on some restora-

tions of distinct vertebrates. At the annual meeting in 1921, which was held in Washington, an interesting paper was read by Maude Slye on the influence of heredity on the incidence of cancer. In the following year, H. F. Osborne read a paper entitled "Recent Discoveries on the Antiquity of Man," and J. S. Ames addressed the meeting on the subject "Recent Progress in Aeronautics." The Carnegie Corporation of New York, which appropriated \$5,000,000 in 1922, and friends of the Academy and Council, made possible the erection of a building for the National Academy and the National Research Council in Washington. At the autumn meeting in 1928, held at Union College, Schenectady, New York, C. F. Kettering, vice president of the General Motors Company, and a newly elected member of the Academy, discussed combustion experiments in explosion-type engines, which were being carried out in the hope of doubling the efficiency of the coal supply. Dr. E. F. W. Alexanderson, consulting engineer of the General Electric Company, described experiments which had been carried on to determine a method of depth sounding in the air by means of a radio echo, to enable aviators to know their exact altitude over mountains, tree tops, or buildings, and to land in fogs; and Professor Harlow Shapley of Harvard Observatory announced his discovery of the centre or nucleus of the universe, which is in the constellation Sagittarius. In 1928 the academy also indorsed the calendar of thirteen months, which would be more simple than the Gregorian calendar now in use.

The Academy awards several prizes and medals in recognition of prominent contributions to science, and grants in aid of researches are made from the income from trust funds administered by the Academy. Its publications include *Memours*, *Bibliographical Memours*, and *Proceedings*. The president in 1928 was T. H. Morgan.

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES. An organization composed of persons actively engaged in educational work and others interested in education. The association was organized at Philadelphia, Aug. 26, 1857, as the National Teachers' Association, incorporated by Congress on June 30, 1907, under its present name, and reorganized in June, 1920, at the annual meeting, to provide for a representative assembly of delegates from State and local educational associations. During the years 1914-1928, the association worked actively for the establishment of a Department of Education in the Government, with a Secretary of Education in the President's cabinet. It also sponsored legislation providing for increased educational opportunities for American children; higher standards of training for teachers; and gave assistance to State and local affiliated associations in securing needed legislation and in promoting their interests.

The association published the monthly *Journal*, established in 1921, to set forth its policies and programmes and to bring before the public and those interested in education the new na-

tional and international movements in education; *Research Bulletin*, containing statistical information on educational subjects; *Proceedings*, the annual report, and numerous other reports on its activities. The work of the association was carried on by 18 departments, each having its own officers, and by 20 committees actively at work on professional problems. Two conventions are held annually, a summer meeting which serves as a clearing house for educational ideas, and reviews the progress of the year in education, and a winter meeting of the Department of Superintendence which convenes the last week in February. The 1928 winter meeting was held in Boston, Mass., the summer meeting in Minneapolis, Minn., July 1-6, with an attendance of more than 10,000. The 1929 convention was held during the first week in July, at Atlanta, Ga., while the Department of Superintendence held its convention at Cleveland, Ohio. The finances of the Association were embodied in two funds, the current and the permanent, the latter amounting in 1928 to \$433,828.60, the receipts for the year ending May 31, having been \$433,842.93. The enrollment as of Jan. 1, 1928, was 181,350. The headquarters of the Association were maintained at 1201 Sixteenth Street, Washington, D. C. Officers elected for 1928-29 were President, Uel W. Lamkin, Maryville, Mo.; secretary, J. W. Crabtree, Washington; and treasurer, Henry Lester Smith, Bloomington, Indiana.

NATIONAL SAFETY COUNCIL. A cooperative, noncommercial organization established in 1913 as an outgrowth of the safety congress held under the auspices of the Association of Iron and Steel Engineers in Milwaukee the previous year. The council consists of an association of companies and individuals active in promoting safety in industrial establishments, on the streets, and in the homes. Annual meetings are held in which matters relating to this object are discussed. With an enlarged membership in 1924, the circulation of the monthly magazine, *National Safety News*, rose, as did that of the various pamphlets of the organization. The engineering section merged with the American Society of Safety Engineers during the year. In behalf of public safety, Secretary of Commerce Hoover arranged for seven national committees to study and report upon street and highway problems. The annual meeting was held at Louisville, Ky. In 1925 the council, which made a particular effort to establish community safety organizations, issued a report of its public accident statistics. Carrying on the work of local organizations, eight community safety surveys were made during 1926. The education division, with the aid of the National Bureau of Casualty and Surety Underwriters, employs thousands of specialists to teach accident prevention in schools and universities. The annual meeting of the council was held in Chicago in 1927. By 1928 the council published, in addition to the *National Safety News*, *Public Safety*, for public officials, *Safety Education*, for schools, and *Safe Worker*, which was distributed monthly among workers. The industrial paper

reaches nearly 10,000,000 persons, representing about 150 occupations. The council is supported by membership dues, the income in 1928 being approximately \$600,000, and it also received contributions from the Rockefeller Foundation. At the annual conference in New York in 1928, Henry A. Reninger was elected president, and W. H. Cameron managing director; the latter is also in charge of the executive officers at 108 East Ohio Street, Chicago, Ill.

NATURAL GAS. The natural-gas industry has been the target of conservation pessimists for a number of years. Dire prophecies as to the life and stability of the industry have been made from its earliest history. In spite of the prophecies, the industry has continued to grow. Each year since 1922 has marked the establishment of a new high record of consumption. In 1929 more than 2500 miles of new high-pressure long-distance gas mains were under construction. Reserves of natural gas were considerably enlarged in 1927 and 1928 by important discoveries in northern Louisiana, east and west Texas, the Texas Panhandle, and California. Montana recently entered the list of important natural-gas producing States with the discovery of gas in the vicinity of Sweet Grass and the starting of a pipe line to Great Falls.

In 1913 the consumption of natural gas in the United States was 581,898,239,000 cubic feet. By 1928 this total had increased to 1568 billion cubic feet. Of the 1928 total, 321 billion cubic feet were purchased by domestic consumers, compared with 1247 billion cubic feet purchased by industrial consumers. In 1914 the leading producing States were West Virginia, Oklahoma, Pennsylvania, Ohio, and California. By 1928 Louisiana, Texas, and Montana had become of corresponding importance. Statistics indicated that the largest proportion of natural-gas production was shifting from the Eastern Middle-Atlantic States to the Southwestern, mid-continent States. The leading producing States in 1928 with their output in billion cubic feet were Oklahoma, 321; Texas, 302; California, 246; Louisiana, 228; and West Virginia, 163.

In addition to domestic and industrial uses of natural gas as fuel, an important branch of the industry was the manufacture of gasoline from natural gas. The natural-gas gasoline industry firmly established itself during 1927 as an important source of motor fuel, 8.51 per cent of the total motor fuel produced during 1927 being natural-gas gasoline. In 1911, when the U. S. Geological Survey collected its statistics for gasoline from natural gas for the first time, it was reported that the year's production of gasoline thus obtained amounted to 7,425,839 gallons. The output of natural-gas gasoline in 1927 was 1,627,600,000 gallons, an increase of 20 per cent over the output of 1926, whereas the corresponding increase in production of gasoline by refineries amounted to but 10 per cent.

California was the largest contributor to the increase in output, the increase for this region being 25 per cent over that of 1926. The deep sands, with rich gas, in the Los Angeles Basin were the principal sources of this increased production. A total of 1102 plants were engaged in the production of natural-gas gasoline in 1926. This gasoline was produced by what is known as the compression process, which in 1926 accounted for 243,084,000 gallons; but the ab-

sorption and combined compression-absorption processes, which accounted for 1,099,891,000 gallons; and by the drip and miscellaneous other processes, by which 20,115,000 gallons were manufactured.

The production of carbon black from natural gas also is an important industry, the output of the United States in 1927 amounting to 198,429,000 pounds valued at the plants at \$10,955,000, or an average of 5.5 cents per pound. This production of carbon black used natural gas estimated at 144,087,000 M cubic feet. Louisiana, or more specifically the Monroe district of that State, with 124,188,000 pounds, and Texas with 56,396,000 pounds of carbon black were the leading States in production. Carbon black is the basis of printing ink.

NAVIES OF THE WORLD. In the following paragraphs, all of the navies of the world possessing any fighting value are briefly described as regards national status, personnel, and average budget (where an average can be given). When the condition of the service seems to require it, some comment is made. In all cases, a list of ships is supplied. The dates in parentheses, following the words, "battleship," "cruiser," "destroyer," etc., are the years in which the vessels were launched. Unless otherwise stated, the tonnages are the normal designed displacements as given out officially by the various navy departments and are supposed to represent the displacement of the vessels in light seagoing trim. In some countries, this means that only half, or less, of the full amount of fuel and stores are on board; in other countries, such as the United States, more than two-thirds. Full-load tonnage means the displacement when all fuel and stores that can be carried are on board. Standard tonnage is the same as full load except that no fuel or reserve feed water is on board; in some cases, it is less than 80 per cent of the full-load displacement. The tonnage given for submarines is the displacement when cruising on the surface. The submerged displacement is 20 to 50 per cent greater than this.

Argentina. The navy is a department of the Government under the control of the Minister of Marine. The personnel consists of about 800 officers and petty officers and 8500 men. The reserve is reported to include about 8000 officers and men and the special reserve, 10,000. The navy yards are at Buenos Aires, Puerto Belgrano

(Bahia Blanca), and Rio Santiago. The fleet consists of 2 dreadnaught battleships of 27,600 tons, armed with 12 12-inch guns, completed in 1914, repaired and partly modernized in 1924-25; four armored cruisers of 6840 to 700 tons, launched 1895-97, but repaired, refitted, and partly modernized 1927-29; two new light cruisers of 6800 standard tons, building (1929) in Italy; one old protected cruiser of 4780 tons, launched 1895, recently repaired and refitted; one training ship of 2850 tons, launched 1898, repaired and refitted in 1926; two old coast-defense ships of 2300, launched 1890-91, recently repaired; five destroyer leaders of 1520 to 1650 tons, 4 launched 1925-1928, 1 building; 4 destroyers of 950 tons and 3 of 340 tons; 3 submarines of 775-920 tons, 3 gunboats of 1100 tons; and a large number of transports as well as small craft.

Australia. Since the reorganization of the British colonial system, the Australian naval force has become the Royal Australian Navy. Upon the conclusion of the World War, as a measure of economy, the fleet was rapidly reduced. In 1924 the public attitude changed and a new naval programme was adopted. This consisted of 2 10,000-ton light cruisers, 2 large submarines, of 1400/1800 tons, and an aircraft carrier. The cruisers and submarines were built in England and arrived in Australia in 1928. The aircraft carrier was built at Sydney and completed early in 1929. The other vessels of the navy are 2 light cruisers of 5400 and 5560 tons, launched 1915 and 1918; 3 seagoing mine sweepers of 1200 to 1250 tons, launched 1915; 1 destroyer leader of 1666 tons (1917); 11 destroyers of 700 to 1075 tons (1909-19); 1 depot and repair ship of 3476 tons (1916); 2 fuel ships of 7806 and 9700 tons (1916 and 1920); 1 depot and receiving ship of 5880 tons (1902); 1 surveying ship of 1320 tons (1918); some small craft. The navy yard on Cockatoo Island, Sydney, is being enlarged and an aviation field and station added. The total personnel of the navy, officers and men, is said to be 5000, of which about 300 are officers.

Austria. The navy is a branch of the Ministry of Defense. The only vessels are 4 patrol boats on the Danube.

Belgium. The Belgian Navy was disestablished in 1927. One gunboat is retained for fishery protection.

Brazil. The head of the navy department is the Minister of Marine. Following the recommendation of the recent commission, composed of officers of the U. S. Navy, the department has been reorganized and is now divided into the bureaus of ordnance, marine engineering, material, personnel, communications, health, and supplies. The personnel consists of about 207 commissioned officers, 254 junior and warrant officers, and 3075 petty officers and men. The fleet is composed of 2 battleships of 19,500 tons (12 12-inch guns), launched in 1908-09 but quite recently repaired and modernized; 1 armored coast defense ship of 3200 tons (1899); 3 protected cruisers of 3100 to 3450 tons, launched 1896-1909 but recently repaired and modernized; 11 destroyers of 560 to 950 tons (1908-13); 1 submarine of 1390/1884 tons (1927); 3 submarines of 250/305 tons (1913-14); 1 submarine carrier, depot, docking, and salvage ship of 4100 tons; 2 fuel ships (1 building); 1 river monitor of 470 tons; a number of river gunboats and other small craft.

UNITED STATES BATTLESHIP "WEST VIRGINIA"

Bulgaria. The navy is a branch of the Ministry of War and Marine. Under the terms of the Treaty of Peace, Bulgaria is permitted to maintain no armed naval force except 4 fast patrol and 6 vedette boats on the Danube for police and preventive duties.

Canada. The head of the Royal Canadian Navy is the Director of the Naval Service, one of the branches of the Ministry of National Defense. The personnel of the navy in 1928 consisted of 70 officers and 500 men in the active force; 70 officers and 430 men in the naval reserve; and 70 officers and 830 men in the naval volunteer reserve. Seven officers and 26 petty officers and men are lent by the British Navy. Ten officers and 150 men will be added to the active force when two new destroyers, building in England, are received. The vessels of the navy comprise 2 destroyers of 1075 tons (1918-19) and 4 mine sweepers of the trawler class of 136 net registered tons, and built in 1918.

Chile. The head of the Chilean Navy is the Minister of Marine. The principal dockyard is at Talcahuano, where are located large dry docks, repair shops, the training establishment, and the gunnery, torpedo, and submarine schools. The other navy yard is at Valparaíso, where are located the naval academy and schools for coast artillery, communications, navigation, and artificers. The law of February, 1924, fixed the personnel of the navy at 602 officers, 5771 enlisted men, and 969 volunteers. The fleet consists of the battleship, *Almirante Latorre* (1913-28,000 tons—10 14-inch guns); 1 old coast defense battleship (1890—reconstructed 1909) of 6902 tons; 1 armored cruiser (1896—rebuilt 1910) of 7050 tons, and 1 of 8500 tons (1897—rebuilt 1919-20); 3 old protected cruisers of 3400 to 4500 tons (1893-97—partly rebuilt since); 1 training ship of 2500 tons (1898—rebuilt 1923-24); 3 submarines of 1400/1800 tons (building 1929); 6 submarines of 364/435 tons (1915-17); 6 destroyers of 1430 tons (building 1929); 2 destroyers of 1430 tons (1911-14); 3 destroyer leaders of about 1730 tons (1911-15); 3 transports of 1124 to 6010 gross tons; and several gunboats and other small vessels.

China. Until the Nationalist or some other government absolutely controls the entire seacoast of China, the navy will probably continue to exist in its present inefficient condition. There is not now, and never has been, a navy department worthy of the name. The fleet is supposed to consist of 6 cruisers (1897-1911) of 2800 to 4500 tons; 3 destroyers (1895-1912) of 400 tons; 6 or 8 torpedo boats of 50 to 100 tons; 3 torpedo gunboats (1895-1902); about 25 gunboats and river gunboats (1903-20) of 150 to 850 tons; 1 transport and 1 training ship—each of 1700 tons. Probably, the hulls, engines, boilers, and guns of these vessels are in very poor condition.

Colombia. The navy is a branch of the Ministry of War. It consists of gunboats which are designed to assist in the suppression of incipient revolution or to effect coast-guard patrol. These are 1 seagoing gunboat (1896) of 643 tons; 2 river gunboats (1897 and 1905) of 400 tons; 3 coast-guard patrol vessels (1925) of about 300 tons, and a number of small coast-guard boats.

Cuba. The administration of the navy constitutes one of the branches of the Ministry of War and Marine. The personnel consists of about 1200 officers and men. The recent reports

give the following figures: line officers, 65; engineer officers, 49; paymasters, 8; surgeons, 8; judge advocates, 2, enlisted force, about 1050. The fleet consists of 2 small cruisers (1911) of 2050 and 1200 tons; 6 gunboats (1900-1912) of 80 to 500 tons; 1 transport (1890) of 3000 tons; 6 coast-guard boats (1890-1912) of 40 to 450 tons; and 6 fast coast-guard boats (ex-submarine chasers—1917-18) of 77 tons. A new building programme is proposed; it consists of 2 cruisers of 2500 and 5000 tons and 16 gunboats of 200 to 900 tons.

Denmark. The head of the navy is the Director General, Ministry of Marine, under the Minister of National Defense. The personnel consists of about 4000 of all ranks. The fleet comprises 5 armored coast-defense vessels (1896-1918) of 2200 to 4200 tons; 3 small cruisers (1909-29) of 1300 tons; 23 torpedo boats (1907-29) of 105 to 300 tons; 14 submarines (1911-27) of 164 to 325 tons (surface displacement); a royal yacht of 1100 tons and several auxiliary vessels and small craft.

Ecuador. The navy department is a part of the Ministry of War. The naval force consists of 1 gunboat (1896) of 750 tons, 1 (1884) of 300 tons, and a few smaller vessels.

Egypt. The naval force is under British control but operated under direction of the Egyptian government. It consists of 3 coast-guard gunboats (1902-26) of 610 to 947 tons and a small cruiser (1917) of 1290 tons.

Estonia. The navy department is a part of the Ministry of War. The personnel is said to consist of about 2100 officers and men, but this is probably an exaggeration. The naval force is composed of 2 destroyers (1915) of 1585 and 1800 tons; 1 torpedo boat (1915) of 228 tons; 5 gunboats of 144 to 1100 tons; 2 small mine layers of 50 tons; and some tugs and other small craft.

Finland. The navy department is a part of the Ministry of Defense. The personnel is composed of about 1300 officers and men. The naval force consists of 2 gunboats (1918) of 342 tons and 2 (1892) of 420 tons; 2 torpedo boats (1899-1901) of 250 and 270 tons; 3 submarines (1929) of 450 tons (surface); and some small craft.

France. The navy department is the Ministry of Marine. The Minister has general control of the navy except as regards naval aviation which, together with the army aviation service, in 1928 was suddenly transferred to the newly constructed Air Ministry in a wave of dissatisfaction because the army and navy air services no longer held most of the aviation records, many being captured by Italy—the French being very jealous of that country's successes. Recent French naval budgets have been steadily expanding from \$52,000,000 in 1925 to \$113,000,000 in 1929, largely due to construction of new 10,000-ton cruisers, destroyer leaders, destroyers, submarines, and auxiliary vessels, as well as the modernization of existing ships, building of the new naval academy, and the development of naval aviation. The French complained bitterly of the provisions of the Washington Conference of 1921 which restricted the tonnage of French capital ships to 175,000; and the French Parliament did not give its assent—a grudging approval—until 1923. And yet France was saved by the Washington Pact from descending to relative naval impotence. Furthermore, although the Pact permitted the French to replace the battleship, *Paris* (wrecked in 1922),

and to lay down a 35,000-ton battleship in 1927 and another in 1929, no plans have been made to do so; instead of this, the navy has expended its money on the vessels mentioned (of which the tonnage is unrestricted by the Pact) and in attempting to modernize and improve old and ineffective ships.

The authorized personnel of the navy in 1929 consisted of 3832 officers and 57,500 men. The officers were: 16 vice admirals, 31 rear admirals, 117 captains, 259 commanders, 360 lieutenant commanders, 800 lieutenants, 540 sub-lieutenants, 428 engineer officers of various ranks, 183 naval constructors and designing engineers, 135 ordnance engineers, 25 hydrographic engineers, 214 commissariat officers, 341 medical officers, 49 pharmacists, and 335 warrant officers. The vessels of the navy, including those under construction, are 3 battleships (1913) of 23,550 tons (carrying 10 13 4-inch guns); 3 battleships (1919) of 23,467 tons (12 12-inch guns); 3 old battleships (1909) of 18,890 tons; 1 aircraft carrier (1927) of 21,800 tons; 1 aircraft carrier (no flying deck—1929) of 10,000 tons; 5 old armored cruisers (1899–1908) of 9700 to 14,100 tons; 7 light cruisers (3 completed, 4 building) of 10,000 tons; 3 light cruisers (1923–24) of 7880 tons; 4 light cruisers (1911–15) of 3500 to 5500 tons; 2 colonial service cruisers (building) of 2500 tons; 54 gunboats and despatch vessels (1916–21) of 500 to 1490 tons; 5 river gunboats (1909–23) of 45 to 232 tons; 19 mine sweepers (1916–17) of 300 to 350 tons; 1 cruiser mine layer (building) of 5600 tons; 25 destroyer leaders (1916–29) of 2380 to 2900 tons; 62 destroyers (1911–29) of 340 to 1495 tons; 55 first-class submarines (1912–29) of 837 to 3250 tons surface displacement; 37 second-class submarines (1913–30) of 415 to 720 tons; 1 cadet training ship (building) of 6600 tons; 1 submarine depot ship (building) of 6000 tons; 1 repair ship (1894) of 11,000 tons; 10 transports, supply ships, etc. (1913–20) of 485 to 3160 tons; 9 patrol boats (1912–19) of 80 to 460 tons; 12 fuel oil ships (1920–1929) of 4000 to 24,000 tons when loaded; 1 armed yacht (1896) of 1400 tons; and various small torpedo boats, coastal motor boats, surveying ships, tugs, etc.

Germany. The German Navy is a branch of the Ministry of National Defense. The amount of the budget increased from 104,200,000 marks (1 mark equals 23.8 cents) in 1924 to 210,000,000 in 1928; but the statements of the budget are so drawn as to make its meaning doubtful to foreigners. About half the appropriations are "provisional," which means that they may be applied to any other purpose than that for which they are voted. Also, according to French critics, the allotments for new construction are two to three times the proper figures. The organization and development of the German Navy seem to be planned for building, maintaining, and operating a great force when the present treaty restrictions are removed. The naval general staff is said to be composed of 17 sections, each headed by an officer of rank, with several juniors. The bureaus into which the navy department is divided are maintained on a similar scale. The active list of officers of the navy is reported to be as follows: the executive branch consists of 1 admiral, 3 vice admirals, 8 rear admirals, 39 captains, 24 commanders, 85 lieutenant commanders, 164 lieutenants, and 200 junior lieutenants and ensigns; the engineer officers comprise 1 rear admiral, 4 captains, 4

commanders, 19 lieutenant commanders, 44 lieutenants, 55 junior lieutenants, and 27 ensigns. The medical corps has 4 officers with the rank of rear admiral. The members of the pay, construction, and legal departments are "officials" and not officers. The total number of officers and men on the active list permitted by the peace treaty is 15,000. The vessels of the navy are 8 old battleships (1902–03) of 13,200 tons—all of which have been thoroughly repaired and partly modernized: 1 battle cruiser (laid down 1928) of 10,000 tons—the first of 4 to be built; 5 new light cruisers (2 building) of 6000 tons; 5 old cruisers of 2900 to 3650 tons; 27 destroyers (1909–27) of 564 to 800 tons; 5 torpedo boats (4, 1907–08—1 building), of 200 to 554 tons; 9 gunboats, tenders, repair ship, etc., of 550 to 1200 tons; and 33 mine sweepers (1917–18) of 481 to 511 tons.

Great Britain. The navy department is styled the British Admiralty and its head, a cabinet minister, is the First Lord of the Admiralty. The average budget from 1922–23 to 1928–29 has been about £58,000,000. The average building programme for several years has been 3 cruisers, 8 destroyers, 6 submarines, 1 or 2 large vessels, and several gunboats or other small craft. The personnel averages about 102,000, divided about as follows: commissioned officers in active service, 5324; subordinate officers, 727; warrant officers, 948; petty officers, men, and boys, 86,122; marine officers, 360; marine warrant officers, 33; marine non-commissioned officers and men, 10,045; cadets at the naval academy, 550; officers of the enrollment service, 75; boys and apprentices under instruction, 3311; miscellaneous services, 1770.

The control of the aviation service is divided between the Air Ministry and the Admiralty—an arrangement which interferes with efficiency and for that reason is bitterly opposed by the navy.

The British naval force consists of the following vessels: 2 battleships (1925) of 35,000 tons (standard—full load about 40,000 tons—guns, 9 16-inch); 5 battleships (1914–16) of 20,350 tons (normal—full load, about 33,000 tons—guns, 8 15-inch; 5 battleships (1913–15) of 27,500 tons (normal—full load, about 32,500 tons—guns, 8 15-inch); 4 battleships (1912–13) of 25,000 tons (normal—full load, about 28,800 tons—guns, 10 13.5-inch); 1 battle cruiser (1918) of 41,200 tons (normal—full load, 45,200 tons—guns, 8 15-inch); 2 battle cruisers (1916—rebuilt 1918–22) of 26,500 tons (normal—full load, about 37,000—guns, 6 15-inch); 1 battle cruiser (1913—rebuilt 1922–23) of 28,500 tons (normal—full load, about 35,000 tons—guns, 8 13.5-inch); 1 aircraft carrier (1919) of 10,950 tons (normal—full load, about 13,000 tons); 1 aircraft carrier (1918) of 22,600 tons (normal—full load, about 26,200 tons); 1 aircraft carrier (1917) of 14,450 tons (normal—full load unknown); 3 aircraft carriers (1916—rebuilt 1924–29) of 19,000 tons (normal—full load, 22,500); 2 light cruisers (building) of 8400 tons (standard—full load, about 11,500 tons); 9 light cruisers (1926–28) of 10,000 tons (standard—full load, about 13,800 tons); 4 light cruisers (1917–21) of 9800 (normal—full load, about 13,000 tons); 2 light cruisers (1919–20, of 7600 tons (normal—standard, 7100—full load, about 9000 tons); 6 light cruisers (1917–19) of 4700 tons (normal—about 6000 at full load); 13 light cruisers (1916–19) of about

4150 tons (normal—about 5200 tons at full load); 11 light cruisers (1914-16) of 3750 tons (normal—about 4650 tons at full load); 2 light cruisers (1913) of 5440 tons (normal—about 6500 tons at full load); 1 light cruiser (1911) of 5250 tons (normal—about 6400 at full load); 3 monitors (1915-16) of 6670 to 8000 tons; 17 destroyer leaders (1914-28) of 1600 to 2000 tons; 146 destroyers (1917-28) of 930 to 1350 tons; 1 submarine (1923) of 2780 tons (normal, surface); 1 submarine (1922) of 2140 tons; 2 submarines (1919) of 1600 tons; 13 submarines (1926-30) of 1346 to 1540 tons; 29 submarines (1917-25) of 890 to 960 tons; 15 submarines (1918) of 440 tons; 29 mine sweepers of 800 to 945 tons; 25 sloops (gunboats) of 1200 to 1290 tons, 1 cruiser mine layer (1924) of 7260 tons (normal—standard, 6740 tons); 6 mine layers of 325 to 535 tons; 19 river gunboats of 180 to 645 tons; 1 depot ship for mine sweepers, 7080 tons; 3 depot and repair ships for destroyers, 6600 to 11,500 tons; 8 depot and repair ships for submarines, 935 to 13,000 tons; 1 large repair ship (building); 1 repair ship of 9600 tons; 1 royal yacht of 4700 tons; 1 admiralty yacht of 3470 tons; 22 oil fuel ships of 6300 to 8100 tons dead weight carrying capacity; 42 oil fuel ships of 200 to 10,000 tons dead weight capacity; 1 fleet supply ship of 5865 tons; 1 distilling ship of 3500 tons; 1 hospital ship of 10,100 tons, 8 surveying vessels of 800 to 1320 tons, 1 target service ship (ex-battleship) of 23,000 tons; 15 trawlers of 500 to 665 tons; 32 drifters of 150 to 190 tons; 19 fleet tugs; and a large number of small vessels of miscellaneous character.

The navy of each of the principal British colonies is controlled by the colony and is styled the Royal Australian Navy, the Royal Canadian Navy, etc. Each is here listed under the name of the colony—Australia, Canada, India, New Zealand, and South Africa.

Greece. The navy department is the Ministry of Marine. The navy is of much importance to the country because of the great extent of seacoast and the relatively large sea-borne trade. The total number of officers and men is reported as 14,000 but this probably includes the reserves not actually in service. The vessels of the navy are 2 battleships—formerly U.S.S. *Idaho* and *Mississippi* (1905) of 13,000 tons; 3 coast-defense battleships (1889-90, rebuilt in 1900) of 4808 tons; 1 armored cruiser (1910) of 9960 tons; 1 cruiser mine layer (1912—rebuilt 1926-27) of 2600 tons; 11 destroyers (1905-12) of 400 to 980 tons; 11 torpedo and patrol boats (1913-15) of 120 to 250 tons; 6 new submarines (1924-28) of 605 to 730 tons (surface); 4 mine layers (1916-26) of 380 to 520 tons; 4 old gunboats (1881-84) of 86 to 469 tons—used as tenders; 1 oil fuel ship (1889) of 4175 tons capacity; 2 colliers (1906) of 4200 gross tonnage; 1 repair and supply ship (1920) of 4549 gross tonnage; 1 water carrier of 750 tons capacity; 1 new training ship (1927) of 1870 tons; 1 hospital ship (1876—rebuilt 1918); a number of patrol boats and other small craft.

Hungary. Under the terms of the Peace Treaty, the only force permitted is a river guard of 8 patrol vessels of 128 tons, 2 motor launches of 20 to 30 tons; 10 motor boats of 12 to 20 tons; the personnel not to exceed 96 officers and 1524 petty officers and men. The existing force consists of 4 patrol boats of 60 to 140 tons and some motor boats. The Royal Hungarian River

Guard is under the control of the Minister of the Interior.

India. Previous to 1926, the Indian Marine had, for many years, consisted of a sort of inspection, police, and patrol service. In February of that year, the Royal Indian Navy was formed with the approval of the King. The name has since been changed to Royal Indian Marine. Its head is the Flag Officer Commanding and Director of the Royal Indian Marine, and the plans of reorganization are being carried out in most respects. Much difficulty is said to be experienced with the caste system among the Hindus and the mixture of the three great religions. The vessels of the Marine are 5 small cruising vessels (1 building, 2 fitted for mine sweeping, 2 for marine survey work) of 1290 to 2100 tons, 2 patrol gunboats of 755 to 838 tons, and 1 depot ship of 1966 tons.

Italy. The navy department is the Ministry of Marine. Its head is a cabinet minister—in 1929, Premier Mussolini. The amount of the naval budget steadily increased from \$31,300,000, in 1922-23, to \$65,800,000 in 1927-28, in 1928-29 it fell to \$60,600,000. The personnel is approximately as follows. executive officers, 1031; naval engineers, 313; naval constructors, 117, surgeons, 184; commissary officers, 217; chaplains in chief, 5; warrant officers, 350, petty officers, 6000, other enlisted men, 37,000. No battleships or battle cruisers have been commenced since the War, most of the new construction being devoted to light cruisers, destroyer leaders, destroyers, and submarines. Much attention is, and has been, devoted to mine laying and aviation, but the expenses of the latter are chiefly borne by the Air Ministry, of which naval aviation is a branch. The vessels of the navy are 5 battleships (1911-13) of 23,000 tons (normal—guns, 13 12-inch); 1 battleship (1910) of 19,600 tons (normal—guns, 12 12-inch); 4 armored cruisers (1902-08) of 7350 to 11,000 tons (normal); 4 light cruisers (2 1926-27, 2 building) of 10,000 tons (standard); 5 light cruisers (building) of 5250 tons (standard); 8 light cruisers (1911-14) of 2530 to 5300 tons (normal); 15 mine layers (1909 to 1927) of 120 to 700 tons; 41 mine sweepers (1918) of 200 to 515 tons, 16 destroyer leaders of 1985 to 2435 tons; 4 mine-laying destroyers (1925-26) of 1300 tons, 12 mine-laying destroyers (1914-19) of 850 to 1556 tons; 4 destroyers (building) of 1450 tons; 10 destroyers (1925-28) of 1150 to 1350 tons, 41 destroyers (1911-23) of 670 to 980 tons; 41 torpedo boats (1911-18) of 125 to 424 tons; 10 submarines (building) of 850 to 875 tons (surface); 12 submarines (1926-28) of 780 to 1390 tons (surface); 33 submarines (1915-18) of 260 to 840 tons (surface); 1 aircraft tender (1923) of 5400 tons; 2 submarine depot ships (1921-22) of 2400 tons; 21 gunboats (1910-22) of 230 tons; 1 river gunboat (1921) of 220 tons; 1 royal yacht (1925) of 5800 tons; 1 government yacht (1904) of 1429 tons; 4 fuel oil ships of 6000 to 8000 tons capacity; 6 fuel oil ships of 1080 to 4000 tons capacity; 1 submarine salvage vessel (1914) of 2100 tons; 1 repair ship (1924) of 8140 tons; 4 high-sea tugs of 840 to 1500 tons; 6 transports (1913-15) of 770 to 12,235 tons; 3 transports (1923-4) of 1035 tons; 7 surveying ships (1911-17) of 370 to 2050 tons; 4 water carriers of 960 to 3000 tons and 30 small carriers; 95 armed motor boats and submarine chasers.

Japan. The navy department is the Ministry of Marine. The average budget in the last few years has been about 250 million yen (1 yen is about 46 cents—par 49.8 cents). The total personnel, officers and men, is about 75,000. As in Great Britain, the navy is of vital importance and all possible means to further its power and efficiency are sought. Feeling unable to measure naval expenditure with the United States, and having persuaded the United States diplomats at Washington to give up the development and armament of the American possessions in the Western Pacific, Japan signed the Five Power Pact with approval and gratification. Since that time, she has continued to increase her fleet in all directions not restricted by the Pact—especially as regards cruisers, in which class her strength much exceeds that of the United States. Japanese naval aviation is being developed upon the same plan as that of the United States—complete naval control of design and operation of naval aircraft. As in the United States Navy, all capital ships and large cruisers of Japan are being fitted to carry two or more sea-planes.

The vessels of the navy are (tonnage, normal, except when given as standard): 2 battleships (1919-20) of 33,800 tons (guns, 8 16-inch); 2 battleships (1916-17) of 31,200 tons (guns, 12 14-inch); 2 battleships (1914-15) of 30,600 tons (guns, 12 14-inch); 4 battle cruisers (1912-13) of 27,500 to 29,300 tons (guns, 8 14-inch); 1 aircraft carrier (1925) of 28,800 tons (standard); 1 aircraft carrier (1921—rebuilt 1924-28) of 28,100 tons (standard); 1 aircraft carrier (1921) of 9458 tons; 1 aircraft carrier (building) of unknown tonnage; 4 light cruisers (1927-28) of 10,000 tons (standard), 4 (building) of 10,000 tons (standard), 2 (to be built) of 10,000 tons (standard), and 4 (1925-26) of 7100 tons (standard); 6 coast-defense vessels (ex-armored cruisers—1898-1900) of 7628 to 9826 tons; 3 light cruisers (1923-25) of 5765 tons, 6 (1921-23) of 5570 tons, 5 (1919-20) of 5500 tons, 1 (1923) of 3100 tons, 2 (1915) of 3500 tons; 3 protected cruisers (1911) of 4950 tons, 1 (1907) of 4100 tons, and 1 (1902) of 3420 tons; 6 gunboats (2 building—others 1901-21) of 620 to 1250 tons; 7 river gunboats (1902-23) of 126 to 340 tons; 24 destroyers (14 building—others 1927-28) of 1700 tons, 24 (1919-25) of 1400 to 1445 tons, 9 (1910-18) of 1000 to 1300 tons, 38 (1916-23) of 850 to 900 tons, and 12 (1912-14) of 600 to 665 tons; 13 mine sweepers of 381 to 700 tons; 7 submarines (building) of 1650 tons or more, 9 (completed 1924-28) of 1650 tons, 10 (completed 1925-28) of 1150 to 1970 tons, 25 (completed 1923-26) of 750 to 998 tons, 19 (completed 1919-22) of 689 to 740 tons, and 8 (completed 1910-20) of 290 to 480 tons; 2 destroyer depot ships (1923-24) of 8500 tons and 3 (1896-1913) of 1230 to 7600 tons; 2 mine layers (building) of 800 tons, 3 (1898-1916) of 2000 to 9700 tons, and 12 (1911-19) of 430 tons; 10 fuel oil ships (1920-23) of 8000 tons capacity and 2 (1917-18) of 1100 and 5000 tons; 2 colliers (1918-19) of 8750 tons capacity; 1 fuel ship (1922) of 2000 tons coal capacity and 7500 tons oil, 1 supply ship (1923) of 17,500 tons; 3 transports (1901-06) of 3844 to 4746 tons; 1 salvage vessel of 1040 tons; 8 training ships; 1 ice breaker; 2 surveying ships; and 4 anti-submarine net layers (laid down 1927-28—no details known).

Jugoslavia. The navy is one section of the Ministry of War and Marine (sometimes called the Ministry of Defense). The navy department is divided into the bureaus of (a) General Service, which is in charge of operations, organization, armaments, and matters not confided to other bureaus; (b) Personnel; (c) Technical, which has charge of navy yards, shipbuilding, machinery, etc.; (d) Naval Aviation; (e) Administration, which has charge of the budget and other financial matters; (f) Health; (g) Law, which has cognizance of disputes, naval justice, etc. The personnel in 1928 consisted of 256 officers and 2000 petty officers and men of the active force; reserve, 164 officers and 570 petty officers and men. The vessels of the navy consist of 1 ex-German cruiser of 2600 tons, completed in 1900, purchased in 1926, rearmed and extensively refitted; 4 ex-Austrian lightly armored Danube River monitors (1892-1915) of 443 to 550 tons; 12 torpedo boats (1906-15) of 200 to 266 tons; 4 submarines (1927)—2 of 975 tons and 2 of 620 tons; 6 mine layers (1917-18) of 520 tons; 4 mine sweepers of 78 tons; 1 submarine depot ship of 2700 tons; 1 training ship of 554 tons; and 8 small auxiliary vessels.

Latvia. The navy is a branch of the Ministry of War. The personnel consists of about 450 officers and men of the permanent force and 200 yearly conscripts. The vessels are 2 submarines (1926) of 390 tons; 1 gunboat (1917) of 525 tons; 2 mine sweepers (1926) of 255 tons; and a surveying vessel (1918) of 285 tons.

Mexico. The navy department is a branch of the Ministry of War and Marine. The vessels of the navy are 1 coast-defense battleship (1898) of 3162 tons; 1 transport (1907) of 1590 tons; 3 gunboats (1891-1903) of 1227 to 1293 tons; 6 patrol vessels (1918) of 486 tons and 2 (1917) of 77 tons.

Netherlands. The navy department is the Ministry of Marine. The average naval budget in recent years has been about \$16,500,000. The personnel of all ranks, including the marine infantry, is about 7500; reserves, about 6000. The vessels of the navy are 4 coast-defense battleships (1902-09) of 5080 to 6530 tons; 2 light cruisers (1920-21) of 7050 tons; 1 training ship (1898) of 4030 tons; 8 destroyers (building) of 1620 tons; 4 (1909-14) of 510 tons; 7 torpedo boats (1906-16) of 103 to 322 tons; 6 submarines (building or projected) of about 600 tons, 15 (completed 1914-25) of 515 to 670 tons, 9 (completed 1909-15) of 130 to 370 tons; 2 submarine depot ships (1915-21) of 800 to 2487 tons; 2 small cruisers (1925) of 1676 tons; 2 gunboats (1896-98) of 800 tons; 18 mine layers (1875-1924) of 210 to 1100 tons; 3 armored gunboats (1912-13) of 540 tons; 4 surveying ships, 6 old gunboats.

New Zealand. The navy department is part of the Ministry of Defense and is governed by the Naval Board of which the Minister of Defense is president. The other members are First Naval Member, Second Naval Member and Chief Staff Officer, and the Naval Secretary; all are officers of the British Navy. The vessels are 2 cruisers (1918-19) of about 4700 tons; 1 fuel oil ship (1906) of 6000 tons capacity; 1 training ship (1890) of 2575 tons; and 1 mine sweeper (1917) of 547 tons.

Norway. The navy department is called the Direction of Marine and is a branch of the Ministry of Defense. The permanent personnel is about 1050; the yearly conscripts, 1000; the

reserve includes all seafaring men. The average naval budget is about \$2,750,000, excluding cost of new construction. The vessels of the navy are 4 armored coast-defense battleships (1897-1900) of 3858 to 4166 tons; 3 destroyers (1910-13) of 540 tons; 26 torpedo boats (1896-1917) of 45 to 220 tons; 6 submarines (4 completed, 2 building) of 413 tons, 3 (1913) of 250 tons; 1 submarine depot ship (rebuilt 1918) of 1920 tons; 10 old gunboats of 233 to 1382 tons; and 3 mine layers (1910-17) of 335 to 755 tons.

Persia. The naval department is a branch of the Ministry of War and Marine. The vessels of the navy are 3 gunboats (1899-1917) of 200 to 1200 tons.

Peru. The navy department is the Ministry of Marine. The fleet is being reorganized with the advice and assistance of a mission from the U. S. Navy. The vessels of the fleet are 2 cruisers (1906) of 3200 tons; 1 destroyer (1909) of 490 tons; 6 submarines (4 completed, 2 building) of 576 tons; 1 old transport of 1790 tons; and 2 river gunboats (1904) of 183 tons.

Poland. The navy department is a branch of the Ministry of War. The personnel consists of 240 officers and 2064 men. A naval base, with docking, repairing, and building facilities, is under construction in the Harbor of Gdynia; completion in 1930 is expected. The vessels of the navy are 1 depot and training ship—ex-French *D'Entrecasteaux* (1896) of 800 tons, 1 station schoolship for officers—ex-French *Desaix* (1901) of 7600 tons; 2 gunboats (1918-19) of 342 tons; 7 river gunboats (bullet-proof gunhouses) of 100 to 200 tons; 8 river monitors (1920-28, bullet-proof turrets) of 70 to 110 tons; 2 destroyers (1928) of 1500 tons; 5 torpedo boats (1914-17) of 335 to 365 tons; 3 submarines (1928) of 980 tons; 1 transport of 8400 tons; 1 surveying ship of 275 tons, and 4 mine sweepers (1917-19) of 171 tons.

Portugal. The navy department is the Ministry of Marine. The personnel consists of 725 officers and 4445 men. The vessels of the navy are 1 old armored coast-defense ship (1876—rebuilt 1902) of 3000 tons; 1 cruiser (1896—refitted 1919-22) of 1729 tons; 2 small cruisers (1915) of 1200 tons, 5 destroyers (1911-23) of 526 to 660 tons; 4 torpedo boats (1913-15) of 266 tons and 1 old boat of 66 tons; 4 submarines (1910-17) of 245 to 260 tons; 1 training ship of 2000 tons; 1 salvage vessel of 1100 tons; 17 gunboats (1878-1928) of 250 to 626 tons; 3 small river gunboats of 38 to 133 tons; 5 transports of 266 to 1775 tons; 1 mining vessel of 78 tons; and 1 mine layer of 151 tons.

Rumania. The navy is a branch of the Ministry of War. The personnel consists of 289 officers and 3700 men. The average naval budget is about \$1,000,000. The vessels of the navy are 2 destroyer leaders (1929) of 1850 tons; 2 destroyers (1918-19) of 1391 tons; 8 Danube River monitors of 450 to 680 tons; 8 torpedo boats (1913-15) of 264 tons; 1 submarine (1929) of 650 tons; 1 submarine depot ship (1929) of 2300 tons; 4 gunboats (1916-17) of 390 to 450 tons; 3 old gunboats of 95 tons; 12 Danube River vedettes and patrol vessels of 43 to 50 tons; 28 river motor launches; and 1 royal yacht of about 650 tons.

Russia. The navy is a branch of the Ministry of War and Marine. In czarist days, the efficiency of Russian war vessels was regarded as inferior to that of similar ships in almost any European navy. Under the Bolshevik rule,

even this inferior condition rapidly declined. From recent reports, there seems to be some improvement, due to better instruction and greater control by ex-czarist officers, but the fighting capacity of the navy is still at a low ebb and must remain so until the Soviet government can evolve some method to secure real discipline, permanent rank of officers, and promotion of the capable—all of which actual communism renders impossible. The personnel, according to Soviet reports, consists of 530 officers and 23,650 men. Of the former, 130 are ex-officers of the Imperial Navy and some others are thought to be ex-German naval officers. Of the men, only 10,120 are serving afloat. The principal naval force is the Baltic fleet which consists of 3 battleships of 24,000 tons, 12 destroyers, and 8 to 10 submarines.

Siam. Under the military-service law of 1917, the navy is recruited from the maritime population; about 5000 are available for service afloat. Many of the officers are Danes or Norwegians. The vessels of the navy are 3 destroyers (1908-17) of 375 to 1035 tons; 4 torpedo boats (1913) of 120 tons; 1 armored gunboat (1925) of 1000 tons; 4 gunboats (1887-1901) of 530 to 700 tons; 1 training ship (rebuilt 1923) of 840 tons; 1 royal yacht (1918) of 2400 tons gross; 1 transport of 850 tons; 8 small river-despatch, coast-guard, transport, and water-tank vessels of 110 to 250 tons.

South Africa, Union of. The South African Naval Service is a branch of the Department of Defense. The vessels are 1 surveying vessel (1919) of 800 tons, 2 mine sweepers (1918) of 325 tons, and a large ocean-going tug of 668 tons.

Spain. The navy department is the Ministry of Marine. The active personnel consists of 1946 officers, 14,000 men, and 3450 marines, and there are about 310 officers in the reserve. Many reports indicate a continuous improvement in recent years—in general organization, dockyards, aviation, and the fleet. The vessels of the navy are 2 battleships (1913-14) of 15 and 452 tons (guns, 8 12-inch), 2 armored cruisers (1895-1900) of 7405 and 9903 tons; 3 light cruisers (building) of 10,000 (standard) tons, 3 (1925-28) of 7880 tons, and 3 (1920-23) of 4725 to 5590 tons; 2 protected cruisers (1898-1900) of 1920 and 2100 tons, 7 destroyers (2 completed—5 building) of about 1650 tons, 3 (1922-24) of 1145 tons, and 4 (1913-16) of 467 to 548 tons; 22 torpedo boats (1912-18) of 177 tons; 12 submarines (4 completed, 1923-29—2 building—6 authorized) of about 915 tons, and 10 (1915-25) of 260 to 556 tons; 7 gunboats (1910-23) of 800 to 1335 tons and 3 of 114 to 158 tons; 12 mine sweepers (1917-18) of 342 to 665 tons; 1 surveying vessel of 2450 tons, 1 new training ship of 3420 tons; 1 aircraft carrier (rebuilt 1922) of 10,800 tons; 1 submarine salvage ship of 2550 tons; 2 fuel oil ships (building) of 6000 tons capacity; 1 collier (1920) of 5000 tons capacity; 8 motor patrol boats; and 5 seagoing tugs.

Sweden. The Swedish Navy Department is a branch of the Ministry of National Defense. The Naval Staff consists of the divisions of mobilization, operations, communications, organization, and intelligence. The active personnel comprises about 5100 officers and men; the reserve is composed of about 340 officers and a variable number of men. The vessels of the navy are 3 coast-defense battleships (1915-18)

of 7600 tons (guns, 4 11-inch) and 8 (1896-1905) of 3600 to 4600 tons (guns, 2 10-inch or 2 8.3-inch); 1 armored cruiser (1905—now used as a training ship) of 5000 tons; 1 aircraft carrier, mine layer, and torpedo transport (building) of 5500 tons; 4 destroyers (2 1926-28—2 building) of 974 tons, and 9 (1905-18) of 460 to 560 tons; 26 torpedo boats (1906-10) of 58 to 124 tons; 17 submarines (1 building—others 1914-28) of 250 to 700 tons, and 3 (1909-12) of 180 tons; 1 cruiser mine layer (1914) of 1800 tons; 3 gunboats (1896-1900) of about 800 tons, and 1 (1891) of 394 tons; 4 depot ships—old battleships (1886-89—later rebuilt) of 3000 to 3370 tons, and 4 (1878-1908) of 500 to 600 tons; 1 hospital ship (1879) of 514 tons; 20 vedette boats (1898-1918) of 55 to 227 tons; 4 sailing training ships of 138 to 1493 tons.

Turkey. The Department of the Navy is now one of the two branches of the recently established Ministry of National Defense. Its head is the Under-Secretary of Defense for the Navy and the department is divided into the Cabinet of the Under-Secretary, the Bureau of Ships, the Bureau of Armaments, the Office of Pay and Pensions, the Office of Supply, and the Office of Medicine. The General Staff includes the former army and navy general staffs. The new naval base and dockyard at Ismid is being steadily developed. The naval establishments at Smyrna and Samsoun have been abolished and that on the Golden Horn has been ceded to another department. The vessels consist of 1 battle cruiser—*ex-Goeben* (1911) of 22,640 tons (guns, 10 11-inch), 1 old battleship (1891—rebuilt 1903—used as training ship) of 9900 tons (guns, 6 11-inch); 2 cruisers (1903) of 3300 and 3800 tons; 1 torpedo gunboat (1906) of 1014 tons; 4 gunboats (1911-12) of 413 to 502 tons; 3 destroyers (1907) of 290 tons; 1 torpedo boat (1905) of 160 tons; 2 submarines (1927) of 505 tons; 1 training ship of 2263 tons; 2 yachts (1903) of 188 and 964 tons; 13 motor launches of 25 tons; 2 seagoing tugs; and 1 mine layer (1912) of 365 tons.

United States. The head of the Navy Department is the Secretary of the Navy. The average budget (exclusive of costs of new construction and modernization of the older ships, which costs vary within wide limits) is about \$300,000,000. The average personnel of the active force for a number of years has been about as follows, the actual figures given being those for 1928-29: officers, 8745; midshipmen at the Naval Academy, 1746; enlisted men, 83,250; nurses, 525; total, 94,266. The Marine Corps consists of 1176 officers and 18,000 men. The retired list consists of 1690 officers and 1498 enlisted men. The naval reserve is being constantly increased. The latest reports of the fleet reserve (officers and men who have served in the fleet) indicate somewhat more than 900 officers and 4500 men in 149 divisions. The number of officers in the merchant marine naval reserve that were commissioned in 1928 was about 1500. About 850 college students are in the various reserve officers' training corps. Aviation, in which the United States Navy leads all others, absorbs about 9800 officers and men.

The total number of airplanes on hand is about 800; in 1931, when the present building programme is completed, the number should equal, or exceed, 1000. Four airships of the "rigid" type are in service or under construc-

tion; one, built in Germany, has a gas volume of about 2,470,000 cubic feet; two, which were commenced in 1928 and have a gas volume of 6,500,000 cubic feet, are much the largest airships ever built; the fourth is a small airship of the "metal-clad" type and is experimental.

The vessels of the Navy are 3 battleships (1921) of 32,600 tons (guns, 8 16-inch); 5 battleships (1917-19) of 32,000 to 32,300 tons (guns, 12 14-inch); 2 battleships (1915) of 31,400 tons (guns, 12 14-inch); 4 battleships (1912-14) of 27,000 to 27,500 tons (guns, 10 14-inch); 2 battleships (1911) of 26,000 tons (guns, twelve 12-inch); 2 battleships (1909-10) of 21,825 tons (guns, 10 12-inch); 2 aircraft carriers (1925) of 33,000 tons (standard), 1 aircraft carrier (authorized—tonnage not settled—to cost more than \$19,000,000), and 1 (1912) of 12,700 tons; 11 armored cruisers (1903-06)—not of much value in war but retained for special peace services—3 are of 14,500 tons, 5 of 13,680 tons, 2 of 9700 tons, and 1 of 8150 tons; 15 light cruisers of 10,000 standard tons (authorized—5 to be laid down in the fiscal year 1928-29, 5 in 1929-30, and 5 in 1930-31), 8 light cruisers (building) of 10,000 tons (standard), 10 (1920-24) of 7500 tons, and 3 (1907) of 3750 tons; 7 old cruisers (1896-1903—useful for peace service only) of 3200 to 3400 tons; 262 destroyers (1912-18) of 1040 to 1215 tons, and 8 (1909-12) of 742 tons, 14 destroyer mine layers (1918) of 1191 tons; 6 fleet submarines (4 completed—2 building) of 2164 to 3000 tons; 53 submarines (1914-24) of 800 to 1106 tons; 65 submarines (1913-19) of 358 to 569 tons; 52 patrol boats (1918-19) of 500 tons, and 36 (1917-22) of 8 to 77 tons, 8 destroyer tenders (1901-23) of 750 to 13,925 tons; 8 submarine tenders (1890-1925) of 3580 to 13,400 tons; 2 aircraft tenders (1919-20) of 11,500 to 16,800 tons; 4 large mine layers (1899-1907) of 3800 to 4400 tons; 3 repair ships (1908-23) of 8100 to 10,000 tons; 5 supply ships (1913-20) of 8500 to 15,200 tons; 2 ammunition and cold-storage ships (1919) of 10,600 tons; 5 fuel ships, capacity 10,500 tons coal and 3000 tons oil, 16 fuel oil ships (1914-21) of 8000 to 11,100 tons capacity; 6 cargo ships (1905-25) of 3000 to 11,450 tons; 2 transports (1916-20) of 10,000 and 13,400 tons, 3 hospital ships (1896-1919) of 5917 to 10,100 tons; 35 fleet tugs of 450 to 1100 tons; 45 mine sweepers (1918-19) of 950 tons; 5 miscellaneous vessels of 1115 to 11,450 tons; and many old ships of no military value used for the training of seamen and naval reserves.

Uruguay. The navy department is a branch of the Ministry of War and Marine; its head is the Director of the Navy. The average personnel is said to be about 700. The vessels of the navy are 1 cruiser (1890) of 2050 tons; 1 torpedo gunboat (1910) of 1150 tons; 2 gunboats of 300 and 678 tons; 7 armed tugs of 60 tons and several smaller harbor craft.

Venezuela. The navy is a branch of the Ministry of War and Marine. The vessels of the navy are 1 small cruiser (1886—rebuilt 1900) of 1125 tons; 1 armed yacht of 750 tons; 2 gunboats of 200 and 300 tons, a sailing transport, and some small patrol vessels.

NAVIGATION. The art of navigation has been greatly improved in recent years by the invention of new devices and the further development of old ones. The net result is increased safety for shipping, especially in the

vicinity of land, and greater ease and economy in handling it everywhere. Some of the most noteworthy of the newer devices are described in the following paragraphs. Much progress also has been made in the computations for determining the latitude and longitude of a ship's position at sea.

Radio Compass. This is a device for the reception of the electromagnetic waves used in radio telegraphy and for determining the direction of their source. Its operation is based on the fact that radio waves have most effect on an antenna or loop when its plane is in the direction of the propagation of the waves. If the waves are not deflected by intervening land or other objects, the plane will point toward the source. Great care is taken to prevent such deflection, but some always exists. This is eliminated from the final result in well-placed and carefully screened stations by determining a curve of error which gives the proper correction to apply to each observed bearing. The compass itself consists of a vertical coil pivoted on a vertical axis rising from the centre of a dumb compass which is set with its zero pointing north. The operator rotates the vertical coil until in the position which gives the minimum of sound in the head telephone. The pointer over the dumb compass then gives the direction of the transmitting station, subject to correction for error. Radio compasses are installed on board ship, as well as ashore, but the shore stations give the best results, as the deflecting objects on large vessels are numerous and troublesome. A ship may thus determine the direction of a shore station, or a shore station may determine the direction of a ship and give her the information by radio. Simultaneous reports from two shore stations may be plotted on a chart; gnomonic projection must be used if over 50 miles away; and the exact location of the ship may be determined, a most important matter in a heavy fog. A large number of shore stations, established on the east and west coasts of the United States and on the Great Lakes, are of great use in foggy weather or when a ship is beyond visual range of definable shore objects but within 150 miles of a compass station. See remarks on the Langevin device in the following paragraph on *Sonic Sounding*.

Sonic Sounding. Deep-sea sounding was, until about the end of the World War, effected by means of a long wire and a detachable sinker. The sonic sounding apparatus or automatic depth recorder was developed and perfected by Dr. Harvey C. Hayes, sound aide and physicist of the Naval Experiment Station at Annapolis, Md. It consists of an oscillator mounted in a tank in the stern of the ship and a hydrophone installed in the bow. Wires from both lead to the bridge or chartroom. Oscillator sound signals are made by the operator. The sound wave, traveling about 4840 feet per second, goes to the ocean bed, is reflected back, and is caught by the hydrophone receiver, which measures the elapsed time. This time interval, referred to a scale, gives the depth in fathoms. The United States Navy was the first to put the device to practical use. The U.S.S. *Stewart* ran a line of soundings from Newport, R. I., to Manila, P. I., and many other naval vessels have done similar work in the Atlantic and Pacific oceans. Apparatus of this sort will probably be applied in the near future to all large vessels as its

value is so great they cannot afford to be without it. A sonic sounding apparatus, devised in 1927 by U. Langevin of the Collège de France, uses ultra sound waves (i.e., sound waves of too high frequency to be perceived by the ear). A tube set produces electric oscillations in a first circuit; these induce a similar condition in a second circuit connected to a plate of quartz. The latter, with its piezo-electric properties, acts as a condenser and transformer, changing electric oscillations to ultra-sound waves and the reverse. The orientation of the quartz plate gives the direction of an obstacle and the time element determines the distance. It thus acts as a radio compass as well as a sonic sounding device.

Earth Induction Compass. This is an instrument devised by Dr. L. J. Briggs and Dr. Paul R. Heyl of the U. S. Bureau of Standards. It is a development of their airplane compass but is larger and driven by an electric motor instead of wind cups. Two direct currents are generated by revolving two pairs of brushes at a velocity of 1400 revolutions per minute in the magnetic field of the earth. The instrument is so adjusted that when it is set for a compass bearing, the currents flowing from both pairs of brushes are equal and produce no effect on a galvanometer. If the instrument turns even slightly, one current becomes stronger, and the dial needle is deflected. On board ship, the generator is placed aloft or as far as possible from the magnetic field of the ship, but the control is in any convenient location. This compass, including its fittings, is comparatively inexpensive.

Gyro-Pilot. This apparatus, designed and developed by Elmer A. Sperry, the inventor of the Sperry gyro-compass, the Sperry gyro-stabilizer, and other important instruments, is a device for automatically steering a ship on any desired course. The course is set on the gyro-compass, and the gyro-pilot not only takes the place of the helmsman in steering but notes each yaw of the vessel as it begins and anticipates the movement by helm change more quickly than a helmsman can. Moreover, it takes cognizance of the speed of the yaw, when increasing and when dying away, and corrects the rudder angle accordingly. The sum total of its efficiency is considerable. It reduces the angle of yaw and the necessary helm angle, on both counts effecting an increase of speed with the same power, and in reducing the yaw cuts down the distance which the ship travels in steering a course between two fixed points.

Flettner Rudder. This is a German invention designed to do away with expensive steering gears and to replace them by a simple form of rudder worked by the streamline pressure exerted on the rudder by the water through which the vessel is moving. This is accomplished by a small auxiliary rudder, or deflector, which is set in a long jog in the after edge of the main rudder and operated independently of it. The combined effect of the deflector and the current of water imparts to the main rudder a large turning movement enabling it to act with prompt and efficient steering effect. The device has not yet found general application.

NEBRASKA. The fifteenth State in size (77,520 square miles) and the thirty-first in population; capital, Lincoln. The population increased from 1,192,214 in 1910 to 1,296,372 in 1920, a gain of 8.7 per cent; estimated popula-

tion, 1928, 1,408,000. The white population rose from 1,180,293 (1910) to 1,279,219 (1920), Negro, from 7689 to 13,242. The State has a very large proportion of native white inhabitants and these increased from 1,004,428 to 1,129,567. The number of foreign-born whites decreased from 175,865 to 149,652. Urban and rural populations showed an increase, the former from 310,852 to 405,306 and the latter from 881,362 to 891,066. The growth of the principal cities was as follows: Omaha (q v), 1910, 124,006; 1920, 191,601; Lincoln, 43,973 to 54,948; Grand Island, 10,326 to 13,947.

Agriculture. As Nebraska is one of the great agricultural States, its farms have been much affected by the World War and post-war conditions (see AGRICULTURE). The number of farms decreased from 129,678 in 1910 to 124,417 in 1920, but rose thereafter to 127,734 in 1925. The acreage in farms, however, decreased from 42,225,475 in 1920 to 42,024,775 in 1925, or by 0.5 per cent. Improved land in farms was 23,109,624 in 1920. The percentage of land used for agricultural purposes was 85.9 in 1920, and 85.5 in 1925. The total value of farm property doubled from \$2,079,818,647 in 1910 to \$4,201,655,992 in 1920, but declined to \$2,874,477,959 in 1925. In interpreting these values, the inflation of the currency incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 67,766 were operated by owners, 669, by managers; and 59,299, by tenants. The comparative figures for 1910 were 79,250; 987; and 49,441. White farmers numbered 124,033 in 1920 and 129,216 in 1910, the native white farmers increasing from 93,509 to 99,441, while foreign-born farmers decreased from 35,707 to 24,592. Of the 384 colored farmers in 1920, 260 were Indians. Farms reported as under mortgage, 35,191 in 1920, numbered 38,279 in 1925. The number of dairy cows in 1920 was 516,716; in 1925, 229,461; "beef" cows, 1,121,564 in 1920, numbered 1,126,199 in 1925; swine, 3,435,690 in 1920, 4,235,638 in 1925; sheep, 537,217 in 1920, 646,783 in 1925. The estimated production of the chief farm crops in 1928 was as follows: Corn, 212,701,000 bushels; wheat, 69,919,000; oats, 78,936,000; rye, 3,486,000; barley, 14,018,000; potatoes, 10,080,000; hay, 5,877,000 tons; and sugar beets, 1,230,000 short tons. Comparative figures for 1913 are corn, 114,150,000 bushels; wheat, 62,325,000; oats, 59,625,000; rye, 1,740,000; barley, 1,760,000; potatoes, 5,664,000; and hay, 1,675,000 tons.

Manufactures. Nebraska is not one of the leading manufacturing States. It has, however, five cities with more than 10,000 inhabitants which in 1920 contained 21.8 per cent of the State's total population and in 1919 reported 81.7 per cent of the State's manufactured products. There were in the State, in 1909, 2500 manufacturing establishments; in 1919, 2884, in 1925, 1303; in 1927, 1277. Wage earners in manufactories numbered 36,521 in 1919; 27,108 in 1925; and 26,110 in 1927. The capital invested amounted to \$99,901,089 in 1909 and \$245,256,684 in 1919. The value of the products in 1909 was \$199,018,579; in 1919, \$506,042,498; in 1925, \$442,083,752, and in 1927, \$420,290,190. The large increase in value of the products about 1919 was due largely to the change in industrial conditions brought about by the War and cannot properly be used to indicate the growth in manufactures, but a normal increase in the number of wage earners and in the number of estab-

lishments indicated a decided growth in the manufacturing activities of the State. The principal manufacturing city is Omaha, which had, in 1909, 432 manufacturing establishments, with a product valued at \$60,855,000; in 1919, 561 with \$452,237,000; and in 1925, products valued at \$339,004,000. Lincoln also is important industrially, having 167 manufacturing establishments in 1909, with a product valued at \$7,010,000; in 1914, 195, with \$10,025,000; and in 1919, 210, with \$23,368,000.

Education. The passage of a succession of legislative acts has done much to improve educational conditions in Nebraska. The Legislature of 1919 passed a certification law standardizing the issue of teachers' certifications by establishing specific legal requirements; a law redistricting the State for the purpose of forming consolidated school districts; and a third making citizenship a necessary requirement for teachers in all public, private, denominational, and parochial schools. The Legislature of 1921 made it mandatory for every school district of the State to provide a minimum term of 9 months when it can be supported on a levy of \$0.008 on \$1 of the actual assessed valuation of the school district. The four State normal schools were designated as teachers' colleges by the 1921 Legislature and were authorized to confer the bachelor's degree on students completing the four years' college course. Midland College changed its location from Atchison, Kan., to Fremont, Nebr., and Bellevue College, formerly at Bellevue, Nebr., was discontinued. Enrollment in public schools in 1925-26 was: all grades, 326,934; elementary, 266,828; secondary, 60,106. Expenditure for public day schools was, current, \$23,725,314; outlays, \$5,623,498. Illiteracy in the State decreased from 2.5 per cent in 1910 to 1.8 per cent in 1920: among the native white population, from 0.8 to 0.5; among the foreign-born white, from 7.1 to 6.6; and among the Negro, from 8.5 to 5.7.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for departmental maintenance and operation, \$10,974,948 (of which \$1,314,251 was for local education); interest on debt, \$37,462; permanent improvements, \$9,208,833; total, \$20,221,243 (of which \$8,195,355 was for highways, \$1,586,749 being for maintenance and \$6,608,606 for construction). Revenues were \$17,286,726. Of this, property and special taxes formed 37.4 per cent; departmental earnings and charges for officials' services, 10.4 per cent, sales of licenses and taxation of gasoline, 29.4 per cent. Property valuation was \$3,321,741,538, State taxation thereon, \$5,849,739. State funded debt was nil.

Political and Other Events. During much of the time subsequent to 1914, control was balanced closely between the Democratic and Republican parties. In 1914 John H. Morehead, the Democratic candidate, was elected governor, and the Democrats elected their candidates for Congress in three districts and the Republicans theirs in the others. A woman-suffrage amendment was defeated in this election. In 1916 the State was Democratic, both nationally and locally. Keith Neville, Democrat, was elected governor and Gilbert M. Hitchcock was reelected to the Senate. For President, Wilson received 158,827 votes; Hughes, 117,771. The Prohibition amendment was carried. In 1918 the Republican nominees were elected to the Legislature

by large majorities. Samuel R. McKelvie, Republican, was elected governor. An amendment to the constitution was adopted, depriving so-called "first-paper declarants," six months resident in the State, of the right to vote. The voters also decided in favor of holding a convention to draft and submit a new State constitution. In October, 1919, a lynching riot occurred in Douglas County during which the county courthouse was damaged by fire, with a loss of nearly \$1,200,000. An administrative code, consolidating government under six department heads, was enacted in 1919. Governor McKelvie was reelected in 1920. For President, Harding received 247,498 votes; Cox, 119,608. During 1920 a constitutional convention adopted 41 amendments to the constitution which were voted on in a special election on September 22. Under these amendments, the English language was required as a teaching medium in all common schools, the governor was empowered to appoint heads of the executive departments, with the consent of the majority of both Houses; a budget system was created; the concurrence of five out of seven judges of the Supreme Court was made necessary for declaring a law unconstitutional; and no appropriations were to go to sectarian institutions not owned and controlled by the State. In 1922 Charles W. Bryan, Democrat, brother of William J. Bryan, was elected governor. Robert B. Howell, Republican, was elected United States Senator, defeating Gilbert M. Hitchcock, Democrat. Classified taxation of intangibles was adopted in 1921, but largely modified in 1925. A bank guarantee fund commission was created in 1923 to handle the fund created in 1909. The fund was reported depleted in 1928. Adam McMullen was elected governor in 1924. For President, Coolidge received 218,585 votes; Davis, 137,289; LaFollette, 106,701. In 1926, McMullen was again elected governor. In 1928 the vote for President was: Hoover, 345,745; Smith, 197,959. Arthur J. Weaver, Republican, was elected governor.

Legislation. The Legislature of 1917 prepared the way for a revision of the State constitution. The right of women to vote was extended to all elections. Provision was made for the election of the judiciary and certain school officers by nonpartisan ballots. A special session of the Legislature was held in 1918 to deal with issues arising from the War. The so-called Mockett Law, under which the teaching of German was made compulsory in the schools, was repealed. The Legislature in 1919 passed a measure consolidating several boards and commissions. The banking laws were amended and so were the "blue sky" law and the workmen's compensation law. A bill was passed for the erection of a new State capitol. The Legislature of 1921 passed measures designed to prohibit aliens' acquiring title to land in the State; provided for the preparation and presentation of a State budget and for the establishment of co-operative associations, and declared English the official language of the State, prohibiting discrimination against its use by religious and social bodies. The school age was raised from 14 to 16 years under certain conditions and the age of minority for women to 21 years. A special session of the Legislature was held in April, 1922, to reduce the appropriations made by the Legislature of 1921. The total amount of reduction made was about \$2,500,000. In 1923 the Legislature passed a measure forbidding the

marriage of persons afflicted with certain diseases. In 1927 the criminal code was made more stringent as to robbery.

NEBRASKA, UNIVERSITY OF. A State institution for the higher education of men and women at Lincoln, founded in 1869. With the exception of the War years, the student enrollment increased steadily from 4133 in 1914, to 6484 in the autumn term of 1928, with 3320 students in the summer sessions of 1928. The faculty showed a corresponding increase during the period of from 283 to 360 members, and the library from 111,000 to 223,885 volumes. The income from the university rose from \$1,000,000 to \$4,135,390. Among the larger number of new buildings added during the period was an animal pathology laboratory, in 1918, when a special State appropriation was made for research in animal diseases. During 1919 and 1920, the following buildings were erected or acquired. On the city campus, Social Sciences Hall, Teachers' College, Ellen Smith Hall, the chancellor's residence, and seven students' houses, and on the farm campus, quarters for an agricultural engineering department, animal pathology and hygiene, and a barn; at the medical college at Omaha, a new laboratory, a nurses' home, and a steam plant. A photographic studio was added in 1921, and in 1923 a beef cattle barn and a new stadium for athletics and public exercises, from funds raised by private subscription. During 1926-27 a new hospital unit was completed at Omaha, and the gymnasium at Curtis remodeled, while new buildings under construction in 1928 included Andrews Hall, to house the college of dentistry and the departments of English, classics, and Germanic languages, on the city campus; a nursery school, a service building, and departmental greenhouses on the agricultural college campus, dormitories at Nebraska Agricultural School at Curtis; and a residence and barns at the Agronomy Farm. An additional gift of \$10,000 for the development of the University Museum was made by the Hon. C. H. Morrill in 1927-28. Chancellor, Edgar A. Burnett, D.Sc.

NEGRO, ECONOMIC STATUS OF THE. In 1910 there were 9,827,763 Negroes in the United States; in 1920 the Negro population of the country had increased to 10,463,131, when it represented 10 per cent of the country's total population. The relative numerical importance of the Negro appeared to be on the decline. In 1790, Negroes made up one-fifth of the population, but as a result of the heavy European immigration following the eighties of the last century, Negro increases from decade to decade fell off. The natural increase of the Negro in the country (surplus of births over deaths) has slowed up, too, though this increase is not smaller than that for the whites. In the decade ending 1890, the natural increase in Negro population was 14 per cent over the previous decade; by 1920, the natural increase had dropped off to 6½ per cent. It is interesting to note that during the period 1915-23, there were actually more Negro urban deaths than births, but this fact was attributed by Negro statisticians to the period of adjustment following the heavy migrations to the cities. In 1920 nine million of the ten and one-half million Negroes in the country lived in the 16 Eastern

and Southern States of Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Texas, Oklahoma, and the District of Columbia. There were 15 Northern and Western States where the Negroes did not constitute as much as 1 per cent of the population; but in Alabama and Louisiana, 38 per cent of all the inhabitants was Negro; in Georgia, 42 per cent; and in Mississippi and South Carolina, more than 51 per cent.

Despite the heavy migrations to the cities following 1916, the Negro population of the United States was still largely rural. Two-thirds of all the Negroes in the country lived in rural areas; in the South, the ratio was three out of four. In fact, 6,660,000 Negroes still lived in the rural areas of the South. In the North, however, only one Negro out of six was a rural dweller. This last fact indicates the outstanding phenomenon in Negro demography since 1914. As a result of the stoppage of immigration brought on by the World War and with the heavy demands for labor made by the war-time industries, there began a trek, on the part of the Negro, from the country to the cities and from the South to the North. During the decade 1910-20, the Negro population in the cities of the North and the West increased from 830,000 to 1,309,000. The outstanding fact, however, was that the urban Negroes increased in such large numbers. By 1920 the number of urban Negroes had swelled to 3,500,000 and by 1928 the figure was estimated to be 4,000,000. During the last 25 years, the Negro population in the cities has apparently actually doubled. By 1920 there were 24 cities in the country that had more than 25,000 Negroes each. Between 1910 and 1920, the Negro population of Philadelphia, for example, had increased 50,000; that of New York had increased 61,000; that of Chicago, 65,000; and Detroit's Negro population showed an increase of 600 per cent.

Prior to the northward migrations, which became pronounced in 1918, the Negro had already found himself being hard-pressed by the competition of white labor in the Southern cities. In other words, the Negro found himself perceptibly being pushed back into the rural areas and even here his labor supply exceeded the demand. The War miraculously changed the economic status of the Negro, for he began to constitute the labor reserve that the war-time industries of the North needed so badly. The result was the movement into the cities of the North, sometimes in the rôle of strikebreaker, more often as unskilled labor. The Negro first went into the lowest kind of work: road building, railway maintenance, steel and iron, etc. At the present time, 10 per cent of all the iron molders in Chicago are Negro; in Detroit, there were 11,000 Negro workers in the Ford plants alone before 1928.

The distribution of Negro workers throughout the country would seem to show concentration in particular industries. Authorities declare that they make up 21 per cent of the building laborers, 60 per cent of the tobacco workers, 14 per cent of the iron and steel laborers, 89.5 per cent of the turpentine laborers, etc. They have, however, fewer than their population proportion of carpenters (3.8 per cent), iron molders (5.5 per cent), coal miners (7.7 per cent). It would seem that the Negro's indus-

trial position is this: he constitutes the needed labor reserve of the country and it has been estimated that the country needs annually one million new recruits in industry. Whether the Negro will reach the status of the skilled white laborer, it is difficult to say. In the South, white labor is distinctly hostile to the Negro and it is as difficult today to find a Negro in the building trades, for example, as before the War it was hard to find a white laborer doing this kind of work. The American Federation of Labor has talked of unionizing the Negro, but achievement in this direction has been small. At the present time, the status of the Negro is determined by existing race prejudice and as long as the Negro is considered barred because of his color, so long will his economic lot be an unhappy one.

The Negro has been seeking to lift himself by the bootstraps to some extent and the census of 1920 showed a fairly large Negro middle class. In 1920 the census listed 80,183 Negroes in the professions, there being 950 lawyers, 3495 physicians, 35,563 teachers, etc. In 1927 there were in the country 28 Negro insurance companies with assets of \$11,170,791; in 1928 there were 33 savings and commercial banks; and 30 to 50 building and loan associations conducted by Negroes. The 33 banks showed, as of July 31, 1927, total assets \$15,292,820. An estimate in 1928 put the number of Negro business enterprises in the country at 70,000. There exist various national commercial organizations such as the National Negro Business League, the National Association of Bankers, the National Negro Hotel Association, the Negro Press Association (which represents more than 400 Negro weeklies), etc.

Some mention should be made of welfare work among the Negroes. At the present time, there exists two national organizations, the National Association for the Advancement of Colored People and the National Urban League. The first has concerned itself with the civil liberties of the race and the second with the problems of employment, housing, and recreation. The Rosenwald Fund has achieved wonders in furthering the cause of education among Negroes in rural areas. From 1913 to September 1928, as a result of the financial aid of this fund, 4148 school units were erected. The total cost of these buildings has been \$20,378,472 of which the Rosenwald Fund contributed \$3,342,752 and a little larger sum came from the Negroes themselves. See LYNCHINGS.

NEIHARDT, JOHN GNEISENAU (1881-). An American writer, born at Sharpsburg, Ill. He studied at the Nebraska Normal School and from 1901 to 1907 lived among the Omaha Indians to study their character and history. His books include *The Divine Enchantment* (1900); *The Lonesome Trail* (1907); *The Dawn Builder* (1911); *The Quest*, poems (1916); *The Song of Three Friends* (1919); *Two Mothers*, a drama (1921); *The Song of the Indian Wars* (1925); *Poetic Values* (1925); *Collected Poems* (1926); *Indian Tales and Others* (1926). *The Song of Three Friends* was awarded a prize by the Poetry Society of America as the best volume

of verse of 1919. He edited several collections of verse and contributed frequently to magazines. In 1921 he was made poet laureate of Nebraska by act of the Legislature and in 1923 was appointed professor of poetry in the University of Nebraska. Since 1926 he has been literary editor of the *St. Louis Post-Dispatch*.

NEILSON, WILLIAM ALLAN (1869). An American college president, who was born at Doune, Scotland, and graduated at the University of Edinburgh (A.M., 1891). For five years he was a teacher in Scotland and at Toronto, Can. Later, he was associate in English at Bryn Mawr, instructor at Harvard, professor of English at Columbia (1905-06), and Harvard (1906-17), and president of Smith College (1917-). He served as exchange professor at the University of Paris (1914-15). He is the author of *Origins and Sources of the Court of Love* (1899); *Essentials of Poetry* (1912); *The Facts about Shakespeare* (1913); *Burns, How to Know Him* (1917); *A History of English Literature* (1920). He has edited *Milton's Minor Poems* (1899); *Shakespeare's Complete Works* (Cambridge Poets, 1906); *The Types of English Literature* (series beginning 1907); *The Tudor Shakespeare* (1911); *The Chief Elizabethan Dramatists* (1911); and *Chief British Poets in the Fourteenth and Fifteenth Centuries* (1916), and has been associate editor of *The Harvard Classics* (1909), *Harvard Classics Shelf of Fiction* (1917), *Selections from Chaucer* (1921).

NEJD, EMIRATE OF. See ARABIA.

NEJLSON, KNUTE (1845-1923). An American lawyer and legislator (see Vol. XVI). He was a member of the United States Senate from Minnesota for five successive terms and was re-elected for the term ending 1925. At the time of his death, on Apr 28, 1923, he was the oldest member of that body in point of service.

NEO-LAMARCKIAN THEORY. See HEREDITY.

NEON LAMP. See ELECTRIC LIGHTING.

NERNST, nĕrnst, WALTER (1864-). A German physicist (see Vol. XVI). He was awarded the Nobel Prize for physics in 1920. His later publications included *Die theoretischen und experimentellen Grundlagen des neuen Warmesatzes* (1918).

NESBIT, EDITH. See BLAND, EDITH NESBIT.

NETHERLANDS, THE, or HOLLAND. A kingdom situated on the North Sea, lying between the Kingdom of Belgium on the south and west and Germany on the east. Its area is 13,205 square miles, of which 617 consist of water. The estimated population Dec. 31, 1927, was 7,625,938, an increase of 760,624 over the census of 1921. The density of population per square mile amounted to 605.1. The urban population constituted 47.02 per cent of the whole, and the rural, 52.98 per cent. Emigrants in 1927 amounted to 3340, most of whom departed from Dutch ports for North America. The royal family and most of the inhabitants are members of the Reformed Church, which is under Presbyterian government, but complete liberty of conscience is granted to all religions. At the census of 1920, there were 2,826,633 adherents of the Dutch Reformed Church; other Protestants numbered 832,164; Catholics, 2,444,583; Jansenists, 10,461; Jews, 115,222; other known creeds, 635,241. The chief cities, with their population Dec. 31, 1927, are Amsterdam, 734,844; Rotterdam, 571,842; The Hague, 416,179; Utrecht, 151,660; Haarlem, 113,304; and Groningen, 101,310.

Agriculture. The total area of agricultural land in hectares (1 hectare = 2.47 acres) in 1927 was 2,519,393 (in 1913, 2,186,591); arable land, 890,687 (882,255 hectares in 1913); meadows, 1,272,743 (1,221,876 in 1913); gardens and orchards, 105,677 (81,460 in 1913); forests, 250,286 (257,939 in 1913); uncultivated land, 747,849 (515,143 in 1913).

Live stock and poultry (1921 and 1910): horses, 363,668 and 327,377; cattle, 2,062,771 and 2,026,943; sheep, 668,211 and 889,036; pigs, 1,519,245 and 1,259,844; chickens, 9,660,800 and 6,709,593.

CROPS AREA AND PRODUCTION

Crop	Area (thousands of acres)		Production (thousands of units—bushels, except as indicated)	
	1909-1913	1927	1909-1913	1927
Wheat	138	150	4,824	5,096
Rye	557	482	16,047	13,594
Barley	68	66	3,271	3,027
Oats	346	366	19,434	22,873
Potatoes	411	425	87,573	90,021
Sugar beets	145	171	1,794	1,852
Flax	33	27	17,276	12,125

^a Unit, metric ton

^b Unit, pound of fiber

Mining and Manufacturing. Mining is limited in the Netherlands to coal mining in the Province of Limburg. The coal production was 10,694,000 metric tons for 1928, against 4,570,000 for 1922 and 3,018,000 in 1917. State-owned mines produced about 66 per cent of the total. In 1927 there were 987 dairies. The production of butter in 1927 amounted to 187,636,000 pounds, and of cheese, 277,667,000 pounds. The beet-sugar refineries numbered 18 in 1926, while the total sugar production amounted to 545,037 metric tons for 1926. In 1926 there were 30 potato-flour factories, 15 cardboard factories, and 17 margarine factories. The latter produced 296,263,000 pounds of margarine.

Communications. Length of railways in 1927 was 2284 miles, as compared with 2325 in 1913. All the railway lines are operated by private companies, including 1348 miles owned by the Government. In 1927 the merchant marine consisted of 1156 vessels of 100 tons or over with a capacity of 2,654,003 gross tons. In 1927, 24,710 vessels of 33,716,000 net registered tons entered the ports of the Netherlands and 24,870 of 33,637,000 tons cleared.

Commerce. Exports in 1928 were valued at \$794,474,000 and imports at \$1,073,556,800. The value of exports in 1927 was 74.5 per cent of the import figure, the highest ratio since 1917. The five leading imports in the order of value in 1928 were textiles, cereals and flour, iron and steel, timber, and coal, the five leading exports, cotton piece goods, butter, coal, cheese, and margarine. The value of trade with leading countries in 1928 (giving Dutch import and export figures, respectively) was: Germany, \$292,058,400 and \$187,095,600; Great Britain, \$100,975,200 and \$172,775,600; Belgium, \$119,948,400 and \$68,840,800; United States, \$106,302,800 and \$27,610,400; Dutch East Indies, \$56,001,200 and \$70,153,200; France, \$48,339,600 and \$49,006,800.

Finance. The budget for 1929 carried proposed expenditures under the ordinary service of 593,651,000 florins (\$237,460,400), practically the same as those of the preceding year, while

the receipts, estimated at 553,127,000 florins (\$221,250,800), were somewhat higher, despite tax reductions that became effective in 1928. Since 1925 actual or anticipated receipts under the ordinary service have been well in excess of the expenditures. Under the extraordinary service, also known as the capital service, proposed expenditures for 1929 totaled 189,221,000 florins (\$75,688,400)—a heavy decline as compared with those of 1928—and the estimated receipts were also lower, at 44,152,000 florins (\$17,660,800). The budget provided, however, for the redemption and conversion of the 1923 "C" dollar loan, the only foreign loan outstanding.

The total public debt on Sept. 1, 1928, stood at 2,813,127,000 florins (\$1,125,250,800), comprising a floating debt of 190,891,000 florins (\$76,356,400) and a consolidated debt of 2,622,236,000 florins (\$1,048,894,400).

History. When the World War broke out, Holland prudently decided to bring its whole military strength into the field. By Aug. 4, 1914, 200,000 men were under arms, and as hostilities progressed and the work of policing the coasts and the frontiers increased, more units were called up, so that at its height, the Dutch Army totaled 400,000 men. The expense was enormous for so small a country. In December, 1914, a loan of \$100,000,000 had to be floated to meet the costs of the establishment. In all, a debt of more than \$750,000,000 was incurred which could be wholly attributed to the War, i.e., for the upkeep of the army and navy, the care of refugees and interned soldiers, etc. In 1915 all workmen engaged in the manufacture of munitions were placed under martial law, and a check was put on their goings and comings; later in the year, the ever-present threat of invasion prompted the Government to declare a state of siege in some of the communes of north Holland and also in some parts of Amsterdam. The feeding of the population and the providing of industry with the raw materials necessary for its operation were perhaps Holland's most pressing problems. Normal activity was dependent on keeping the regular channels of trade clear.

Having become a country of truck farmers and cattle breeders, Holland depended on Germany for her coal and iron and on France, Great Britain, and the United States for her foodstuffs and textiles. A brisk overseas and land trade was carried on with all these, as well as with Switzerland, Italy, and Austria-Hungary. The War curtailed intercourse on land, except with Germany, and the British blockade and the German submarine policy, as well as American seizure of Dutch ships in 1918, played havoc with the Dutch merchant marine. More and more, Holland was put at the mercy of belligerents, and only the conclusion of the War checked the progress of the famine gripping her people. Extraordinary administrative measures had to be taken. In 1914 and 1915, the export of cereals and flour, cotton, rice, and linseed was prohibited. In 1915 the Netherlands Overseas Trust was formed for the purpose of handling imports. Before Great Britain and France would give their consent to the maintenance of the usual trade relations, it was necessary for the Trust to give assurances that the articles imported would not be reshipped to Germany.

In 1916 the scarcity of flour forced the prohibition of the baking of white bread; maximum prices for cereals were fixed. The dislocation of trade with the Dutch East Indies compelled the

Government to maintain a strict surveillance over the distribution of foodstuffs and fodder. What little prosperity there was grew out of the maintenance of relations with the Central Powers; Germany and Austria took Holland's vegetables and dairy products, and Germany, in turn, sent coal and iron.

In a situation of such complex relations, the rise of irritations was inevitable. Clashes with Germany and the Allies were frequent. During 1915-17, notes were interchanged with Germany over the violation of Dutch neutrality by the landing of airships, the stopping of merchant vessels, and the mining and torpedoing of Dutch ships; in 1918, feeling ran high over the British and American seizure of Dutch ships. Not until the Armistice did Holland dare relax her vigilance, and then the threat of mutiny among the soldiers hastened demobilization sooner than the Government might have wished. The problem of the returning soldiers, in view of the disorganization of industry and the dearth of housing, contributed greatly to the trials of the state. (At the end of the War, there was a shortage of 35,000 houses in Amsterdam alone. However, work on new ones was quickly undertaken, and by the close of the year 1922, 20,000 had been built or were nearing completion.) Despite these local problems, the Dutch worked unsparingly in the interests of their less fortunate neighbors. The invasion of Belgium sent into Holland some 1,200,000 refugees who were clothed and fed for varying lengths of time. By the end of the War, there were still about 30,000 such refugees partaking of the hospitality of the Dutch. Interned soldiers at times numbered as many as 50,000, most of them Belgians, but also many Russian and German deserters. The Dutch Red Cross did yeoman work in facilitating the exchange of British and German prisoners. In all these humanitarian activities, the Government expended \$25,000,000, while private contributions easily reached a similar amount.

The War years also witnessed civil and political developments of extraordinary importance. By the Electoral Reform Act of Dec. 12, 1917, universal suffrage and proportional representation were established. In 1917, by a constitutional amendment, the Government was ordered to provide for the upkeep of denominational as well as secular schools. As a result of an increasing labor agitation during the War, a series of enactments was promulgated in 1919 which aimed at better social and working conditions. By these laws, the eight-hour day was assured in factories and offices; workmen's insurance was extended to all industries except agriculture and navigation; the general supervision of health activities was turned over to a state health council, a council of labor was erected to advise generally all administrative departments in the conduct of labor affairs; but the inability of affairs to mend, in spite of paternalistic legislation, increased the insurgency of the labor classes.

In 1918 and 1919, under the leadership of Troelstra, the Social Democrats pressed for a political revolution, some even demanding the abdication of the Queen. Continued hard times brought on a serious dock strike during February-April, 1920, and such outbreaks were frequent in the subsequent years. The unemployed on Jan. 1, 1924, numbered 102,225, but by July 30, 1927, this figure fell to 47,200. Meanwhile, the membership of the Socialist Party increased, so that on Mar. 31, 1928, it numbered 52,206.

Incidentally, the strike situation became so serious that a law for compulsory arbitration of labor disputes was passed. It went into effect on May 4, 1926.

Politically, the threat of proletarian control forced the union of most of the elements of the Right, with the result that a Catholic government was constituted in 1918, for the first time, under Jonkheer Ruys de Beerenbrouck. The elections of 1922 for the second chamber returned 32 Catholics, 20 Social Democrats, 16 Anti-revolutionists, and some others, so that the Beerenbrouck ministry continued in power by the support of the Right bloc.

The question of the defense of the Dutch East Indies agitated the people profoundly during 1920-23. In 1921 the Queen's address from the throne included a request for the strengthening of the fleet, and the proposal was backed up by the resolution of the Indian Council. In 1922 the Government laid before the second chamber an ambitious programme of naval construction. See NAVIES OF THE WORLD. The measure was stubbornly contested in 1922 and 1923. Its opponents showed that it meant an additional cost to Holland of \$14,000,000 yearly for 12 years, and to the colonies of \$20,800,000 for the same term. Nevertheless, it was only after a bitter struggle that profoundly shook the whole kingdom that the naval bill was rejected, Oct. 26, 1923, by a vote of 50 to 49. The Ruys de Beerenbrouck cabinet then resigned. The inability of the three parties of the Right to reach an agreement compelled the Queen, after a three-month suspension of governmental activities, to recall de Beerenbrouck in January, 1924.

The next elections took place on July 1, 1925, and the slim majority of the bloc of Catholics, Colonist Anti-revolutionists, and Christian Historicals was cut by five more votes. Thereupon, de Beerenbrouck resigned, to be succeeded by the Anti-revolutionist, H. Colyn. On Mar. 8, 1926, Colyn was replaced as Premier by Jonkheer Dr. D. J. de Geer, leader of the Christian Historical Party. The next regular quadriennial elections, on July 1, 1929, left the relative position of the more important parties in the Lower House practically unchanged. The Catholics retained their 30 seats; the Anti-revolutionists lost one, and retained 12; the Christian Historicals kept their 11; and the Socialists again held 24.

A Frisian nationalist movement for cultural autonomy assumed importance in northern Holland during 1928. A Pan-Frisian Congress, in which the inhabitants of German Friesland were also represented, was established, and organizations for teaching the "native" language to Frisian children were formed. Demands also were made for a chair in Frisian philology at a Dutch university.

Holland's post-war foreign relations were stormy. On Nov. 10, 1918, the Dutch were unpleasantly surprised by the presence of the former Kaiser in their midst. His stay at Amerongen was unmolested, and in spite of demands from the Allies for his extradition in 1920, the Dutch government refused to yield him up. All other questions yielded precedence to the demand of Belgium for the revision of the treaties of 1839. Belgium, in effect, desired sovereignty over the western Scheldt, as well as the district of southern Limburg on the east. Belgium sought the left bank of the Scheldt for the further development of Antwerp; Limburg was desired for strategic and economic reasons. For the consid-

eration of the question, the Supreme Council in 1919 created an international commission, but it circumscribed that body's activities by indicating that it would refuse to countenance any transfer of territory. The disputants were advised to come to an amicable understanding over the matter of waterways. In 1920 an agreement was reached on the administration of the Scheldt, the Antwerp-Meuse-Rhine canal, and two other water systems. Further difficulties arose, however, with Belgium's insistence that the disposition of the Weilingen at the entrance to the Scheldt, for the pass controlled the port of Zeebrugge, be also considered.

The Foreign Ministers of the two countries signed a convention on Apr. 3, 1925, which closed the Scheldt to warships in war time, but left it open to all other vessels both in war and peace. The Weilingen question, however, was not broached in the agreement. Then a treaty concerning navigation on the Scheldt and the Rhine was rejected by the Dutch Senate by a vote of 33 to 17, on Mar. 24, 1927. The Senate feared that the treaty would help Belgian Antwerp prosper at the expense of the Dutch city of Rotterdam.

There were other international concerns to occupy the attention of the Dutch in this period. In 1920 Holland joined the League of Nations. On Dec. 23, 1920, after heated debate, the Parliament voted to resume relations with the Vatican. These had terminated in 1907. In the same year, although it formally refused to open commercial relations with Russia, the Foreign Office indicated that it would not interfere with business transactions. In 1922 Holland welcomed to The Hague the Permanent Court of International Justice which had been created by the League of Nations. In 1926 and 1927, the authorities were faced by serious Communist revolts in Sumatra and the Dutch Indies, but relative quiet was restored in 1928. On Mar. 16, 1925, the Dutch Senate ratified a treaty of Aug. 21, 1924, giving the United States the right to search Dutch vessels for liquor outside the three-mile zone. A dispute between Holland and the United States over the sovereignty of the island of Las Palmas, situated between the Dutch East Indies and the Philippines, was referred, on Oct. 5, 1925, to Judge Max Huber (Swiss), President of the International Court, for settlement. The United States claimed the island, which is two miles long, three-quarters of a mile wide, and has a population of 700, as part of the Spanish cession of 1898. The arbitrator decided in favor of Holland on Apr. 4, 1928. See DUTCH EAST INDIES.

NETHERLANDS INDIA. See DUTCH EAST INDIES.

NEUILLY, TREATY OF. See PEACE CONFERENCE AND TREATIES.

NEUMANN, NO'MAN, ALFRED (1895-). A German writer of short stories, novels, plays, and essays, born in Lautenburg, West Prussia. He won the Kleist Prize with his novel *Der Teufel* (1926). His other works include *Die Laeder vom Lachen und der Not*, poems (1917); *Lehrer Taussig*, essays (1923); *Die Bruder*, novel (1924); *Der Patriot*, drama (1926); and *Rebellen*, novel (1927). A number of his works were translated into English and several plays were produced in England and America.

NEUROSES. See PSYCHOLOGY, ABNORMAL and PSYCHOANALYSIS.

NEUTRODYNE. See RADIO TELEPHONY.

NEVADA. The sixth State in size (110,690 square miles) and the forty-eighth in population; capital, Carson City. The population decreased from 81,875 in 1910 to 77,407 in 1920, a loss of 5.5 per cent. The white population fell off from 74,276 to 70,699; Indian, from 5240 to 4907; Negro, from 513 to 346; native white, from 56,277 to 55,897; foreign-born white, from 17,999 to 14,802. The urban population of the State rose from 13,367 to 15,254, while the rural population decreased from 68,508 to 62,153. The only important city in the State is Reno, with 10,867 inhabitants in 1910, 12,016 in 1920.

Agriculture. Agriculturally, Nevada is one of the least important States, although its agriculture is second only to its mining and no other industry approaches it. The number of farms increased 17.6 per cent, or from 2689 in 1910 to 3163 in 1920 and rose farther to 3883 in 1925. The acreage in farms decreased from 2,714,757 in 1910 to 2,357,163 in 1920, but rose to 4,090,586 in 1925. The improved land in farms totaled 594,741 acres in 1920. The percentage of land used for agricultural purposes was 3.9 in 1910 and 5.8 in 1925. The total value of farm property rose from \$60,399,365 in 1910 to \$99,779,666 in 1920 and remained almost unchanged in 1925, at \$98,086,358; the average value per farm was \$22,462 in 1910, \$31,546 in 1920, and \$25,260 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1920, 3463 were operated by owners; 114, by managers; and 306, by tenants. The comparative figures for 1910 were 2175; 181; and 333. White farmers in 1920 numbered 2044, compared with 2528 in 1910. In 1920 native white farmers numbered 2060, compared with 1661 in 1910; foreign-born white farmers, 884, compared with 867. Colored farmers in 1920 numbered 219, of whom 208 were Indians; in 1910, 161, of whom 148 were Indians. Farms reported as under mortgage, 884 in 1920, numbered 1164 in 1925. The number of dairy cows was 16,482 in 1920; 17,380 in 1925; "beef" cows numbered 189,960 in 1920; 173,695 in 1925; sheep, 880,580 in 1920; 1,183,572 in 1925. The area under irrigation in 1919 was 561,447 acres; in 1909, 701,833. The estimated production of the chief farm crops in 1928 was as follows: Wheat, 482,000 bushels; barley, 440,000; potatoes, 840,000; and hay, 733,000 tons. Comparative figures for 1913 are wheat, 1,081,000 bushels; barley, 492,000; potatoes, 1,760,000; and hay, 646,000 tons.

Mining. The most important mineral products of the State are copper, silver, gold, and lead. Silver, which was formerly the most important mineral, showed a great decline subsequent to 1914, when the production was 15,455,491 fine ounces, 1916, 13,837,525; 1917, 11,269,969; 1918, 10,000,599; 1919, 6,863,580; 1920, 7,745,093; 1921, 7,083,782; 1922, 8,619,587; and 1926, 6,518,983. The value of the gold produced also decreased sharply in this period; the output in 1914 was valued at \$11,481,188, 1918, \$6,619,937; 1920, \$3,566,728; 1922, \$3,297,384; and 1926, \$3,625,461. Copper showed an increase in the years affected by the World War, but declined sharply subsequently; the production in 1914 was 60,986,450 pounds; 1916, 105,116,813; 1918, 116,316,441; 1920, 50,559,763; 1921, 10,961,491, and 1926, 101,827,937. The small output in 1921 was due chiefly to the business depression, which caused a decrease in the demand for

copper. The production of gypsum during the period ranged from 100,000 up to 350,972 short tons per year, with a value of \$1,527,235 in the year 1926. In addition to the minerals mentioned, the State also produces lead, manganese ore, and zinc in important quantities. The total value of the mineral products in 1927 was \$26,753,295; \$25,648,961 in 1920; \$24,457,735 in 1919; \$51,080,169 in 1918, and \$29,984,338 in 1914.

Education. The educational problem of Nevada is made difficult by the State's sparse population and its vast area. In spite of these difficulties, the progress of education has persisted. Efforts have been in part directed toward the consolidation of schools and the development of vocational education. The Legislature passed many measures which greatly aided the administration of the educational system. Vocational education is administered by the Director of Vocational Education and Industrial Rehabilitation, who is also supervisor of trade and industrial education. The object in vocational education has been to reach, through a coöperative spirit, as large a number as possible of persons who may be benefited by the various types of instruction offered, in order that the productive industries of the State may be encouraged and the intelligence of those employed in the trades and other industrial pursuits may be increased; and efforts toward these objects have been successful. The cost of education in the State from 1912 to 1920 increased greatly; in 1912 the cost per pupil was \$76.38; in 1925-26, \$125.35, a figure exceeded only in three other States. A high-school system was developed efficiently. The total enrollment in the schools in 1913 was 13,622; in 1925-26 it was 15,614; of this number, 12,804 were in elementary classes and 2810 in secondary. The expenditure on public day schools in 1925-26 was: current, \$1,810,735, outlays, \$146,491. The high expenditure per capita of pupils was ascribable to the sparsity of population, which rendered services costly by making it necessary in many instances that they be supplied to small groups of pupils. Illiteracy in the State decreased from 6.8 per cent in 1910 to 6.7 per cent in 1920. Among the native white population, it increased from 0.3 to 0.5 per cent; among the foreign-born white, from 7 to 8.5; among the Negro, it decreased from 6 to 4.7.

Finances. State expenditures in the year ending Dec. 31, 1927, as reported by the U. S. Department of Commerce, were for maintenance and operation of departments, \$2,123,925 (of which \$449,664 was for local education); for interest on debt, \$72,102; for permanent improvements, \$1,634,662; total \$3,830,599 (of which \$1,847,344 was for highways, \$402,723 being for maintenance and \$1,443,621 for construction). Revenues were \$4,062,117; of this, property and special taxes formed 33.8 per cent; departmental earnings, 6.5 per cent; licenses, including gasoline-sale tax, 12.7 per cent. Assessed property valuation was \$203,070,872; State taxation thereon, \$1,229,171. Net State indebtedness on Dec. 31, 1927, was \$1,650,376.

Political and Other Events. In 1914 the Democratic candidate for governor, Emmet D. Boyle, was elected. Senator Newlands was re-elected, while the Republicans elected a Representative to Congress. An amendment providing for woman suffrage was adopted. In 1916 the Democrats elected Key Pittman as Senator.

In the presidential voting, Wilson received 17,778 votes; Hughes, 12,127. The Democrats in 1918 reelected Governor Boyle. Senator Newlands died in 1918 and Charles B. Henderson was appointed. The Republicans in 1920 elected Oddie as Senator. In the presidential voting, Harding received 15,479 votes; Cox, 9851. In the elections of 1922, the Democrats elected every State official except one. James W. Scrugham was elected governor and Senator Pittman was reelected to the Senate. The Supreme Court in 1923 declared unconstitutional the Prohibition Act passed by the Legislature in that year. In 1924 the presidential vote was: Coolidge, 11,243; LaFollette, 9709; Davis, 5009. Fred W. Balzar, Republican, was elected governor in 1926. In 1928 Hoover, for President, received 18,327 votes; Smith, 14,090.

Legislation. The most important acts of the Legislature since 1914 are noted below. The Legislature, in February, 1915, passed a so-called "easy divorce bill," restoring the six months' residence requirement which had been abolished by the Legislature of 1913. The Legislature of 1919 provided for a budget and required an eight-hour day on public works, and passed statutes defining and punishing criminal syndicalism and sabotage. In 1921 enactments created town-planning commissions for incorporated cities and towns and declared oil pipe lines to be common carriers. A bill for capital punishment by lethal gas instead of by hanging or shooting became law. In 1923 the Legislature repealed the State Prohibition Law which had been declared unconstitutional and substituted a measure corresponding to the Volstead Act. It also granted equal rights to women in the guardianship of children, extended the absent-voter privilege to persons who because of physical disability should expect to be confined to their homes on election day, made the possession of drugs illegally obtained a crime, enacted a modified old-age-pension law, and created a small claims court. Old-age-pension payments were put under county control in 1925. County and municipal borrowing was regulated in 1927; the divorce residence requirement was reduced to three months.

NEVADA, UNIVERSITY OF. State institution for men and women at Reno, founded in 1874. The student enrollment of the university increased from 340 in 1914 to 849 in the autumn of 1928, in addition to which there was a summer session enrollment in the latter year of 117; during the same period, the faculty increased from 50 to 74 members; and the library from 28,000 bound volumes (1915) to 48,934. Productive funds in 1928 amounted to \$358,439, and income for the year to \$652,664. An agricultural building was constructed in 1918, an educational building in 1920, and a building to house the Federal Bureau of Mines' Rare and Precious Metals Experiment Station in 1921. Walter E. Clark, Ph.D., LL.D., succeeded Archer Wilmot Hendrick as president in 1917.

NEVIN, ARTHUR FINLEY (1871-). An American composer, born at Edgeworth, Pa. Having received his first musical education from his father, he entered the New England Conservatory in 1891, studying with O. Bendix (piano) and P. Goetschius (theory). From 1893 to 1897, he studied in Berlin with Klindworth, Jedliczka (piano), and Boise and Humpferdinck (composition). He then returned to Edgeworth, where he lived until 1910, devoting

his time to composition and teaching. In 1903-04 he spent some time with the Blackfeet Indians in Montana, collecting their melodies and legends. There he found the subject for his Indian opera *Poa*, which was produced at the Royal Opera in Berlin (1910), the first work of an American composer ever brought out at that institution. In 1915-20 he was professor of music at the University of Kansas, and in 1921-22 he was director of municipal music at Memphis, Tenn. He also wrote two other operas, *The Daughter of the Forest* (Chicago, 1918) and *Twilight* (not produced up to 1929); a masque, *A Night in Yaddo-Land*; two cantatas, *Roland and The Dynms*; three orchestral suites, *Minature*, *Lorna Doone*, and *Love-Dreams*; *Bakawah Dances* for orchestra; a string quartet and a piano trio; and piano numbers and songs.

NEVINSON, CHRISTOPHER RICHARD WYNNE (1889-). An English painter, born at Hampstead. His training was obtained at Uppingham, St. John's Wood School of Art, Slade School, and Julien's, Paris. His first paintings were exhibited in London in 1910. Since that year, he has exhibited annually in London, Paris, New York, Washington, and Chicago. During the World War, he saw service in Flanders, exhibited war paintings at the Leicester Galleries in 1916, and returned to France as an official artist in the following year. The Imperial War Museum purchased 10 of his war paintings and the Canadian War Memorials Fund, five others. Drawings, etchings, and lithographs are owned by the British Museum, the Luxembourg, Harvard University, the National Gallery of Canada, and the National Gallery at Brussels. The Czechoslovak Republic officially invited Nevinson to represent British art at Prague in 1920. Among his publications are *Modern War*; *British Artists at the Front*, *The Great War*; *Fourth Year*; and *C. R. W. Nevinson (Contemporary British Artists Series)*.

NEVINSON, HENRY WOODD (1856-). An English newspaper correspondent and writer, educated at Shrewsbury School and Christ Church, Oxford. He was correspondent for the *Daily Chronicle* in the Greco-Turkish War of 1897, in Crete, in Spain, and in South Africa during the Boer War. He went to Central Africa (1904-05), exposed the Portuguese slave trade there in *A Modern Slavery* (1906), and was in Russia during the uprising of 1905-06. He went to India for the *Manchester Guardian* and reported the campaigns in Morocco and the Balkans (1912) for various newspapers. He was accredited by the War Office as official correspondent at the Dardanelles for several papers and was wounded during operations there. He was later correspondent with the British Armies in Saloniki, Egypt, France, and Germany. After the World War, he was frequently a special correspondent for the *Manchester Guardian*. He was on the staff of the *Nation* from its foundation until 1923. His other works include *Books and Personalities* (1905); *Essays in Freedom* (1909); *The Growth of Freedom*, "a sketch of the development of political and personal liberty" (1912); *Essays in Rebellion* (1913); *The Dardanelles Campaign* (1918, 3d ed., 1920). *Original Sinners*, a novel (1920); *Lanes of Life*, verse (1920); *Essays in Freedom and Rebellion* (1921); *Changes and Chances*, an autobiography (1924); *More Changes, More Chances* (1925); and *Last Changes, Last Chances* (1928).

NEW, HARRY STEWART (1858-). A Postmaster General of the United States, born at Indianapolis, Ind., and educated at Butler University. He began as a reporter on the Indianapolis *Journal*, and from 1878 to 1903 he was editor, part owner, and publisher of that newspaper. He served in the Spanish-American War. In 1896 he was elected to the Indiana State Senate for four years, and from 1900 to 1912, he was a member of the Republican National Committee. In 1917 he was elected to the United States Senate and served till 1923, when he was appointed postmaster general by President Harding and retained the office throughout President Coolidge's administration. He gave especial attention to the extension of air-mail routes in the United States and planned a system of air communication with the Latin-American countries.

NEWARK. The largest city of New Jersey. The population rose from 347,469 in 1910 to 414,524 in 1920, and to 473,600 in 1928, by estimate of the U. S. Bureau of the Census. The latter figure is practically doubled by the adjacent cities and suburbs, including Elizabeth, Bayonne, Harrison, the Oranges, Belleville, Nutley, Bloomfield, and Montclair, which constitute Greater Newark. Since 1917 the city has operated under a commission form of government, five commissioners-at-large elected every four years constituting the governing body. Each commissioner is the director of one of five departments: public affairs, public works, finance, public safety, and parks and public property. The director of the department of public affairs serves also as mayor of the city.

In 1915 the city-planning commission offered a comprehensive plan for the city of Newark, and in 1919 a zoning plan was adopted. The 250th anniversary of the founding of the city was celebrated during five months of 1916 with a historical pageant, a prolonged music festival, and an exhibition of local industries. A memorial building was erected by the city at a cost of \$1,500,000 to mark the occasion. Other important buildings erected since 1916 include a two-story city market which covers two acres, completed in 1923 at a cost of \$5,100,000; the Newark Museum of Industry, Art, and Science opened in 1926, toward the construction of which Louis Bamberger contributed \$500,000; the Hall of Records erected in 1928 for the accommodation of many of the county offices, and the new Annex to the City Hall built in Romanesque style, completed in 1928, at a cost of \$1,061,000. In Military Park, an irregular plaza used in colonial days as a drill ground and surrounded by public and semi-public buildings, there has been erected a bronze group by Gutzon Borglum depicting the Wars of America.

Newark's development as a seaport is comparatively recent. In 1914 the city began the creation of Port Newark on Newark Bay southeast of the city, a part of New York Harbor, as a shipping terminal and industrial centre. On the entrance of the United States into the World War, the War Department leased 133 acres of the newly-filled land for one of its largest supply bases, spending \$12,000,000 on docks, warehouses, and freight-handling equipment; and the U. S. Shipping Board established a \$30,000,000 shipyard where 17,000 persons were employed by the Submarine Boat Corporation in the construction of 150 steel cargo vessels. At the close of the War, the city acquired the Army Base, including

nine warehouses with 2,000,000 feet of floor space, and resumed its programme. By 1929 it had spent nearly \$6,000,000 reclaiming, filling, and developing a large area of the meadows for industrial sites and, with Federal aid, constructing a channel 30 feet deep and 400 feet wide. Six public and 139 private docks and piers have been constructed. Water-borne commerce in 1927 amounted to 7,115,323 tons. In 1926 the construction of the four-track bridge of the Central Railroad of New Jersey, across Newark Bay between Bayonne and Elizabeth, N. J., was completed at a cost of approximately \$15,000,000.

Industrially, Newark ranks fourteenth among the cities of the United States in value of output. In 1925, 66,854 persons were employed in 1668 manufacturing establishments and received \$89,640,000 in wages; the value of products manufactured was \$490,046,599. Among the principal products in 1925, measured by value, were: electrical machinery, apparatus, and supplies (\$51,564,446); paints and varnishes (\$23,271,662); leather (\$22,945,072); jewelry (\$22,301,802); chemicals (\$18,053,917); and meat products (\$17,682,863). Newark is also important as an insurance centre. The 16 large life, fire, and casualty companies which have home offices there employ some 9000 persons and have assets aggregating \$2,100,000,000.

The Newark metropolitan airport, consisting of 350 acres of city-owned land at the port of Newark, was established in 1928 for commercial aviation. It is to be used by the Post Office Department as the concentration and distributing base for air mail for the metropolitan district and eastern points. In 1929 contracts were made for the construction of a new Union Pennsylvania Railroad station in Newark, extension of the Hudson & Manhattan tube system, and the building of a new high-speed trolley line in the bed of the old Morris Canal. The city's share in the total cost will be about \$12,500,000. The water supply of Newark from the Pequannock River has been increased by the development of the Wanaque watershed, a joint undertaking by several municipalities of northern New Jersey, which will supply a total of 100,000,000 gallons a day; 40,500,000 gallons have been allotted to Newark. See **WATER SUPPLY**.

The city's public-school system comprises 68 elementary, three junior high, five senior high, two vocational, two continuation, and 17 evening schools. There are 27 parochial schools, and several private schools, including Newark Academy, founded in 1792. The Newark Institute of Arts and Sciences (1910) is an extension of New York University. Newark is the seat of a State normal school (established 1913); the Newark College of Technology (1885), which coordinates theoretical instruction with practical training in industrial plants; the New Jersey College of Pharmacy (1891), now affiliated with Rutgers University; and the New Jersey Law School (1908). Bank clearings in 1928 amounted to \$1,520,155,000. The assessed valuation of property in 1927 was \$821,841,000; the net debt was \$83,252,000.

NEWARK MUSIC FESTIVAL. See **MUSIC, Festivals**.

NEW BEDFORD. The fourth city in Massachusetts and the third in value of its manufactured products. The population increased from 96,652 in 1910 to 121,217 in 1920, and to 130,072 in 1923, according to estimate of the U. S. Bureau of the Census, but decreased to 119,038,

according to the assessors' estimate of Apr. 1, 1927. Between 1914 and 1924, a State pier, 750 feet long, with a depth of 25 feet of water on sides and end, was completed. This pier afforded double-track accommodations for 24 freight cars and had ample loading platforms and large storage space. A modern intersecting sewer system also was installed at a cost of \$3,500,000, with capacity to care for a population of 300,000. The capital invested in the textile industry rose from \$47,820,575 in 1914 to \$73,794,900 in 1927, and the number of persons employed from 31,820 to 35,966. New Bedford is the spot cotton market of the North and has five public modern warehouses with a capacity of 12,400,000 cubic feet. Other manufactures include fine tools, twist drills, dies, silverware, cut glass, rope, cordage, shirts, underwear, overalls, cloth caps, paper goods, boxes, sheet copper, soap, mechanical toys, electrical devices, refined oils, tire fabrics, etc. The industries of New Bedford represent a capital investment of more than \$175,000,000.

The city of New Bedford has a public-school system consisting of 36 elementary schools, two junior high schools (erected in 1926), and one high school. In addition, there are the New Bedford Vocational School, the New Bedford Textile School, and the Swain Free School of Design. Bank clearings in 1928 amounted to \$54,673,000. The assessed valuation of property in 1927 was \$315,738,000; the net debt was \$10,360,000. On Apr. 16, 1928, a general strike of between 25,000 and 30,000 cotton-mill operatives was called on account of an announced wage reduction of 10 per cent. Work was suspended for about six months in the great majority of the mills, on October 6, the unions voted to return to the shops with a wage cut of 5 per cent.

NEWBERRY, TRUMAN HANDY (1864-). An American financier and public official, born in Detroit, Mich. He was graduated from Yale in 1885 and was later connected in various capacities with railroads and other industrial organizations. In the Spanish-American War, he served as lieutenant and navigator. He was appointed Assistant Secretary of the Navy in 1905 and served until 1908, when he assumed the post of Secretary of the Navy until March, 1909. In the World War, he was commander of the United States Naval Reserves. He was elected to the United States Senate in 1918, defeating Henry Ford for the nomination. The expenditure of over \$200,000 in the primaries led to accusations of corruption. He was tried and convicted in the State courts, but the case was dismissed in the United States Supreme Court. Charges were brought before the Senate Committee on Privileges and Elections in 1922, and he was exonerated. He resigned his seat following the elections of 1922.

NEWBOLT, SIR HENRY (JOHN) (1862-). An English writer, best known for his sea poetry and stories (see VOL XVI). Besides receiving honorary degrees from various universities, he was knighted in 1915 and made a Companion of Honor in 1922. From 1911 to 1921, he was a professor of poetry and he was controller of wireless and cables during the World War. In 1923 he was made official Naval Historian, and wrote *Naval Operations*, vol. iv (1928). His later work included *The Book of the Blue Sea* (1914); *The Book of the Thin Red Line*, adventures (1915); *The Story of the Oxfordshire and Buckinghamshire Light Infantry*

(1915); *A New Study of English Poetry* (1917); *St. George's Day and Other Poems* (1918); *The Book of the Long Trail*, tales of explorers (1919); *A Naval History of the War* (1920); *The Book of the Grenvilles*, fiction (1921); *Studies Green and Grey*, essays (1926); and *New Paths on Helicon*, one of his many anthologies (1927). In 1925 he became editor of the *Teaching of English Series*.

NEW BRUNSWICK. A Canadian maritime province, with an area of 27,985 square miles. In 1911 the population was 351,889; in 1921, 387,876, a gain of 10.23 per cent. The estimated population on June 1, 1929, was 419,300. The rural population in 1921 was 67.9 per cent of the total, in 1911 it was 71.7 per cent. Populations of the principal towns in 1921 were St. John, 47,166 (42,511 in 1911); Moncton, 17,488; Fredericton, the capital, 8114.

Industry and Trade. In 1927 only 889,276 acres out of the total area (904,055 in 1914) were under field crops, although agriculture is the most important industry. Total value of yield in 1926, \$23,338,000, in 1914, \$29,045,100. Oats, hay and clover, and potatoes receive the greatest attention. Dairying has shown substantial gains, since 1,413,454 pounds of butter were made in 1926, against the 849,633 pounds in 1910. Fishing occupies a high station; in 1928 the catch was valued at \$4,996,898, comparing favorably with that of 1913. Mineral production in 1927, largely made up of coal and gypsum, reached \$2,024,025, as compared with \$1,102,613 in 1913. Much of the forest land is in the hands of the Government, and lumbering ranks high among the industries. Lumber cut in 1925 was valued at \$10,513,568; pulpwood made a very thriving industry (153,669 tons), worth about \$8,424,327. In 1910 there were 1158 manufacturing establishments (capital \$36,125,012); in 1925, 846 establishments (capital, \$91,509,933). The output in 1910 was \$35,422,302, in 1925, \$73,374,600. Of the 87,000 horse power estimated available, 47,231 (1928) was already being worked. Exports, domestic and foreign, amounted to \$100,973,185 in 1926-27 (\$34,634,156 in 1912-13); imports in 1926-27, \$28,279,707 (\$14,445,811 in 1912-13). In 1926 there were 1935 miles of railway line, as compared with 1545 in 1913.

Government. The receipts for 1927 were \$4,933,029 (\$1,459,000 in 1913), and expenditures, \$4,917,237 (\$1,446,963 in 1913). The debt of the province in 1912 was only \$4,693,457; by October, 1926, it had mounted to \$35,325,909. The money expended on public works, i.e., hydro-electric development, roads, bridges, and grants to railways, accounted for the increase. By 1927 the number of teachers reached 2533 from the 2002 in 1913, and of pupils, 80,690 from the 63,580 in 1913. The total cost of education also increased, from \$942,203 in 1913 to \$3,071,315 in the 1926-27 school year. The province is represented in the Canadian Parliament by 10 senators and 11 members of the House. The suffrage is exercised by both sexes.

NEW CALEDONIA. See PACIFIC OCEAN ISLANDS.

NEWELL, EDWARD THEODORE (1886-). An American numismatist, born at Kenosha, Wis., and educated at Yale University. He was president of the American Numismatic Society after 1916 and wrote many works on coins and minting, including *The Dated Alexander Coinage of Sidon and Ake* (1916); *Tarsos under*

Alexander (1919); *Myriandros* (1920); *The Kyprassia Hoard* (1921); *The Comages of Demetrius Poliorcetes* (1927).

NEWFOUNDLAND. A British dominion in North America, comprising the island of Newfoundland and Labrador. See LABRADOR. The area of the island is 42,734 square miles; of Labrador, 120,000. The total population increased from 242,619 in 1911 (Labrador, 3949) to 262,979 in 1921 (Labrador, 3621) and to 263,182 in 1927 (Labrador, 4054). St. John's, the capital, had a population of 40,059 in 1926 (32,292 in 1911); Harbor Grace, 3825 in 1921 (4279); Bonavista, 4025 in 1921 (3911); Carbonear, 3320 in 1921 (3540). The population, the great bulk of which is native and of English, Irish, and Scotch descent, still remains practically concentrated on the southeast coast. Emigration rose noticeably during the post-war depression. In 1927 there were 13,687 immigrants and 15,765 emigrants.

Industry and Trade. Fishing exceeds all other occupations in importance. In 1927, 740 men and 41 vessels on the Bank cod fishery brought in a catch of 99,663 quintals, compared with 152,374 quintals brought in by 1830 men in 104 vessels in 1913. Exports of codfish in 1927 were 1,557,753 quintals. The serious decline in the seal fishery was partly attributable to the loss of ships and the prohibitive cost of shipbuilding. In 1913, 19 steamers with 3609 men brought in 272,065 seals; in 1928 the catch was 227,022 seals, with 12 vessels and 2200 men engaged. The lobster, herring, and whale fisheries have shown a distinctly downward trend; lobsters have grown scarce because of overfishing and a closed season was declared from 1924 to 1928; the herring market is affected by renewed European competition; the whale fisheries have practically ceased operation. To relieve the serious situation that ensued, the Government in 1923 undertook a programme of encouragement for industry and farming, in order to relieve the almost entire economic dependence of the island on its fisheries. The industries growing out of the great forest resources have extended considerably. Spruce has replaced the disappearing pine as the important wood. In 1927 for the first time, the value of pulp and paper production (\$13,000,000) exceeded that of the fisheries. The mineral production, chiefly iron, in 1912 amounted to \$2,810,000; in 1926-27, 929,000 tons of iron, valued at \$1,580,000, were exported. Some copper and oil have been produced. The mineral resources are as yet unexplored, although in 1921 a beginning was made at the development of certain coal deposits and the investigation of oil-bearing lands. In 1928 an American firm was developing a lead and zinc mine at Buchans. A mill was built with a daily capacity of 600 tons. Of the 4,000,000 acres capable of cultivation, up to 1928 only 230,000 were being utilized, and the Government was actively encouraging the population away from the sea to the land. The chief crops are hay, potatoes, cabbage, turnips, and oats. The total value of farm crops in 1912 was \$2,000,000; in 1921, \$14,367,877. Exports, which in 1913-14 were valued at \$14,720,000, had risen to \$30,839,859 in 1926-27. Imports rose from \$14,793,000 in 1913-14 to \$25,814,000 in 1926-27. The chief markets in the export trade are the United Kingdom, Portugal, Spain, Canada, and the United States. The bulk of the imports come from Canada and the United

States. Dry codfish is the principal export, with manufactured paper in second place, although in 1927 their positions were reversed. The total revenue of the dominion, in bulk from customs, was \$3,142,491, and the expenditure \$3,524,653, in 1911-12. In 1920-27 revenues were \$8,932,000 and expenditures, \$10,533,000. The increase of the funded public debt from \$29,470,060 in 1912-13 to \$55,030,027 in 1921-22 was largely due to World War expenditure (\$60 per capita). On June 30, 1927, the public debt was \$72,018,000. In 1927 there were 905 miles of government railroads, as compared with 794 in 1913. Additional proposed extensions had been postponed during the War, after which, because of unprofitable operation, the management of the roads and their extension became a conspicuous problem of the Government. There was an additional 69 miles of private line. The mileage of telegraph wires (open) increased from 4225 in 1914 to 7500 in 1926; telephone wires, from 899 in 1913 to 12,000 in 1926. Steamship communications with the United Kingdom, Canada, and the United States were disorganized during the War, but have been restored. Public instruction still remains under denominational auspices, with government support, and school attendance has not been made compulsory by law.

History. A Newfoundland regiment was enlisted on the outbreak of the War, and saw service in Gallipoli, Egypt, France, and Flanders. In all, some 6500 men were under arms. In 1913, Sir Edward Morris's party was returned to office and continued in power through 1917, when the Morris government was succeeded by a ministry headed by Sir William Lloyd. In 1919 Sir Michael Cashin became Premier, in November, 1919, as a result of the general election, Richard Squires succeeded to office. The Squires government, however, resigned in 1923, though the general election of May had returned it with a sizable majority. W. R. Warren was then summoned by the governor. On Dec. 26, 1923, Premier Warren brought a grave accusation against his predecessor, Sir Richard A. Squires, charging him, among other things, with the receipt of money from private corporations and diversion of government funds to individuals occupying official posts. An investigator for the British Colonial Office found the charges in a large measure true; this was followed by the arrest of Squires in April and the overthrow of the Warren government. Reorganization of the public services and a greater honesty in government became the leading issues of the day. Mr. Hickman, who succeeded Mr. Warren, enjoyed only a brief tenure of office, for his party was turned out in the general election of June 3. He was in turn followed by Walter Monroe. The next general election was not held until October, 1928, when Sir Richard Squires and the Liberal Party were returned by a large majority. For an account of the settlement of the Labrador boundary dispute, see LABRADOR.

NEW GUINEA. One of the largest islands of the world, in the East India Archipelago. Area, 320,000 square miles (estimated). Politically, it was divided into: (1) Dutch New Guinea, area, 160,692 square miles; population (1920) 195,480; (2) Territory of Papua (British New Guinea), area, 90,540 square miles; estimated population 276,428 (1928); (3) Territory of New Guinea (late Kaiser Wilhelm's Land), area, 70,000 square miles; population (estimated), 100,000 (for the mainland only).

Dutch New Guinea is administered from the Dutch East Indies of which, for trade and other purposes, it was considered an integral part. See DUTCH EAST INDIES.

The **Territory of Papua** is a possession of the Australian Commonwealth. Little of the area is under cultivation; the natives are averse to hard labor. In all, only 186,966 acres have been leased by planters (1927), and coconuts, rubber, and sisal hemp are the chief products. Gold continues to be mined to some extent, and boring for oil began after 1915. The gold output declined from £64,115 in 1912-13 to £7240 in 1927-28. Imports and exports for 1913-14 were £212,134 and £123,140; for 1928, £403,561 and £350,363. Revenues and expenditures for 1913-14 were £54,703 and £81,095; in 1928, £107,052 and £158,964. To meet the deficit, Australia supplies an annual grant of £50,000. The Australian government has shown itself zealous in the preservation of the integrity of the natives and has refused to settle cheap coolie labor in the territory. In 1928 Europeans numbered 1428. Port Moresby is the chief town and port of call for Australian ships.

The **Territory of New Guinea** is the name given to the former German New Guinea and included, besides the late Kaiser Wilhelm's Land, (area, 70,000 square miles; population, 100,000), the Bismarck Archipelago (area, 17,600 square miles; population, 188,000), made up of New Britain, New Ireland, and other islands, and Bougainville and Buka of the Solomon Islands group (area, 3400 square miles; population, 17,000). On Sept. 12, 1914, an Australian force occupied the islands. A mandate was given to Australia for the territory by the League of Nations on Dec. 17, 1920; the Australian government established its civil administration on May 9, 1921. The seat of government is at Rabaul on New Britain, the former German capital. In 1921 nonindigenous inhabitants numbered 3173, divided as follows. 715 British, 1402 Chinese, 215 Dutch, 579 Germans, 87 Japanese, and 60 Americans. On the mainland, coconuts are cultivated as well as rubber and cacao; tropical fruits serve as the articles of food. Total revenues for 1918-19 and 1927-28 were £55,760 and £223,645. Exports for the same years were £269,666 and £1,471,026; imports, £271,861 and £811,832. Leading exports in 1927-28 were copra, 65,285 tons; shell, 433 tons; cacao, 173 tons. Imports include groceries, hardware, tobacco, spirits, and oils. See also ETHNOGRAPHY.

NEW HAMPSHIRE. The forty-third State in size (9341 square miles) and the forty-first in population; capital, Concord. The population increased from 430,572 in 1910 to 443,083 in 1920, a gain of 2.9 per cent; estimated population, 1928, 456,000. The white population increased from 429,906 to 442,331; Negro, from 564 to 621; native white, from 333,348 to 351,098. The number of foreign-born whites fell from 96,558 to 91,233. The urban population mounted from 255,099 to 279,761, while the rural decreased from 175,473 to 163,322. The two important cities are Manchester and Nashua. They increased, respectively, from 70,063 in 1910 to 78,384 in 1920 and from 26,005 to 28,379.

Agriculture. After a decrease of 24.1 per cent from 1910 to 1920, the number of farms rose from 20,523 in 1920 to 21,065 in 1925, or by 0.4 per cent. The acreage in farms, however, continued to decline from 2,603,806 in 1920 to

2,262,064 in 1925. The total percentage of land used for agricultural purposes was 45 in 1920 and 39.1 in 1925. The total value of farm property rose from \$103,704,196 in 1910 to \$118,656,115 in 1920, but declined to \$107,084,055 in 1925; the average value per farm was \$3833 in 1910, \$5782 in 1920, and \$5084 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 19,895 were operated by owners; 156, by managers; and 1014, by tenants. The comparative figures for 1910 were 24,493; 681; and 1879. In 1920 white farmers numbered 20,509, of whom 17,890 were native and 2619, foreign born. In 1910 the white farmers numbered 27,038 (native-born, 24,347; foreign-born, 2691). Farms reported as under mortgage numbered 5389 in 1920; 4716 in 1925. The number of dairy cows fell from 119,203 in 1920 to 81,504 in 1925; that of "beef" cows decreased from 5055 in 1920 to 2815 in 1925; sheep, from 28,021 to 16,055. The estimated production of the principal farm crops in 1928 was as follows: Corn, 560,000 bushels; oats, 390,000; potatoes, 1,656,000; hay, 665,000 tons. The comparative figures for 1913 are corn, 814,000 bushels; oats, 420,000; potatoes, 2,074,000; hay, 495,000 tons.

Manufactures. New Hampshire is an important industrial State in point of value of products. In 1920 there were eight cities of 10,000 inhabitants or more, the combined populations of which formed 43.7 per cent of the total for the State; in 1919 they reported 63.3 per cent of the value of the State's manufactured products. In 1909 there were 1961 manufacturing establishments in the State; in 1919, 1499; in 1925, 1038; and in 1927, 1028. Wage earners in manufactories numbered 83,074 in 1919; 66,658 in 1925; and 65,482 in 1927. The capital invested amounted to \$139,989,662 in 1909 and \$329,166,870 in 1919. The value of the products was \$164,581,019 in 1909; \$407,204,934 in 1919; \$327,400,651 in 1925; and \$327,528,366 in 1927. The increase in the value of products about 1919 was in great measure due to changes in industrial conditions brought about by the War. Among the chief industries is the manufacture of boots and shoes, amounting to \$39,440,000 in 1909; \$92,259,000 in 1919, \$52,631,681 in 1925. Its rival in magnitude is the manufacture of cotton goods, which had a value of \$33,602,000 in 1909; \$86,392,000 in 1919, \$57,868,732 in 1925. Manufactures of woolen and worsted goods, in third place, were valued at \$16,731,000 in 1909; \$15,039,000 in 1914; and \$45,944,000 in 1919. The wood-pulp and paper industry, next in order, had an output valued at \$13,994,000 in 1909; \$17,708,000 in 1914; and \$41,826,000 in 1919. The most important manufacturing cities are Manchester and Nashua. In Manchester, there were 175 manufacturing establishments in 1909 with a product valued at \$46,812,000; in 1914, 151, with \$50,800,000; in 1919, 165, with \$117,493,000. In 1909 Nashua had 104 manufacturing establishments, with products valued at \$17,326,000; in 1914, 87, with \$22,780,000; and in 1919, 92, with \$48,985,000. Other important manufacturing cities are Concord, Dover, Keene, Berlin, Laconia, and Portsmouth.

Education. The development of their educational system has always been one of the chief concerns of the people of New Hampshire. As in the case of the other New England States, the

decrease in rural population has created a difficult problem. In 1919 large sections of New Hampshire had become so impoverished and so depopulated that under the existing school laws reasonable elementary education could not possibly be provided for a very large number of children. Because of this, the Legislature, after a careful study, reorganized the school system and for the first time in the history of the State wrote the school laws into a consistent code in 1921. The results of this action were immediate. The principles of Americanization, equalization, and supervision were adopted. More specifically, the Board of Education was reorganized, methods of consolidation were provided, and, especially, provision was made for education in sparsely populated districts. The Legislature of 1923 passed several important measures which amplified and revised measures already enacted. For one, the provisions of the Smith-Hughes Act of 1917 for the promotion of vocational education were accepted, and the State Board of Education was authorized to arrange with institutions and school boards of towns or city districts in the State to furnish the necessary buildings and equipment for carrying out the provisions of the Federal Act. In 1914 the enrollment in the public schools was 63,004, in 1925-26, 71,785. In the latter year, in the elementary schools and kindergartens, 59,028 were enrolled; and in the high schools, 12,157. The total expenditure for public schools in 1925-26 was, current, \$5,872,928, outlays, \$1,012,362. The percentage of illiteracy in the State decreased from 5.5 in 1910 to 5.4 in 1920; among the native white population, from 0.9 to 0.6; among the Negro, from 13.8 to 7.7. In the foreign-born population, it increased from 15.4 to 16.4.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were for maintenance and operation of governmental departments, \$5,907,726 (of which \$593,170 was aid to local education); for interest on debt, \$74,215; for permanent improvements, \$1,826,294; total, \$7,808,235 (of which \$2,863,302 was for highways, \$1,515,964 being for maintenance and \$1,347,338 for construction). Revenues were \$7,783,195. Of this, property and special taxes formed 41.1 per cent; departmental earnings and charges for officials' services, 9.3 per cent; and sales of licenses and taxation of gasoline, 38.5 per cent. Property valuation was \$663,865,495; State taxation thereon, \$3,036,918. State net funded debt on June 30, 1928, was \$1,817,720.

Political and Other Events. After 1914, New Hampshire remained consistently Republican, with the exception of one year, when the Democrats succeeded in electing their candidate for governor. In 1914 Rollin H. Spaulding was reelected governor, and J. H. Gallinger was reelected to the Senate. In 1916 the Republicans elected Henry W. Keyes governor, and carried other State offices. Wilson for President obtained 43,871 votes; Hughes, 43,725. At this election, the people voted to call a constitutional convention. In January, 1916, the United States government purchased, under the Weeks Forestry Land Act, a tract of 55,000 acres to be added to the forest reserves. Senator Gallinger died during the primary election campaign of 1918, and the term of Henry F. Hollis, Democrat, expired in 1918. Gov. Keyes was elected Senator for the regular term and

George H. Moses was chosen successor to Senator Gallinger. John H. Bartlett, Republican, was elected governor. The constitutional convention met in June, 1918, but adjourned following its organization. It met twice subsequently, but none of the amendments it submitted to the people was ratified. The Republicans elected their candidate for governor, Albert O. Brown, in 1920, and reelected Senator Moses. For President, Harding received 94,947 votes; Cox, 62,562. In 1922 the Democrats elected their candidate for governor, Fred H. Brown, and a Representative to Congress. They also elected a majority of 10 in the State House of Representatives, although the Republicans continued to control the Senate. Coolidge received 98,575 votes for President in 1924; Davis, 57,201; LaFollette, 8993. John G. Winant, Republican, was elected governor. Huntley N. Spaulding, Republican, was elected governor in 1926. In 1928 the vote for President was: Hoover, 115,404; Smith, 80,715. Charles W. Tobey, Republican, was elected governor. Floods caused widespread damage in the State early in November, 1927.

Legislation. The Legislature of 1917 amended the laws relating to the conduct of trials and made provision for the calling of a constitutional convention in June, 1918. The governor received authority to suspend the labor laws by the request of the Council of National Defense. A "blue sky" law was enacted and the laws relating to banking and education were amended. Enactments of 1921 regulated the practice of chiropractors; provided further safeguards against forest fires, made provisions for the protection of maternity and infancy; and regulated and limited the investments of savings banks. In 1923 the Legislature made provision for another constitutional convention; passed a uniform sales act, levied a gasoline tax, and laid a tax on income from intangibles. A special session late in 1927 provided measures of relief and restoration necessitated by the November, 1927, flood.

NEW HAMPSHIRE, UNIVERSITY OF A State institution of higher education for men and women at Durham, founded as the New Hampshire College of Agriculture and the Mechanic Arts as a part of Dartmouth College in 1866, transferred to Durham as State College in 1893, and incorporated as the University of New Hampshire, July 1, 1923. It consists of a college of liberal arts, a college of agriculture, and a college of technology. The institution grew rapidly between 1913-14, when the student enrollment was 300 and the faculty numbered 48, and 1928-29, when corresponding figures were 1523 and 148. The summer session of 1928 had a registration of 348 students. The library was increased from 35,000 to 63,000 volumes. The endowment in 1928 amounted to \$1,030,000 and the income for the year totaled \$1,452,322. The school year 1925-26 was the first under the millage law of 1925 which provides an annual amount equal to one mill for each dollar for the assessed valuation of the State. This fund, which in 1927-28 amounted to \$656,524, together with income from other sources, is sufficient for the maintenance of the institution and for the gradual construction of a complete physical plant in accordance with a comprehensive plan for the development of the university. In 1925 a wing of the Commons Building was erected, a dormitory for the accommodation of 150 men

was under construction, plans were made for the erection of a liberal arts building, and a plan was formulated by a landscape architect for the improvement of the campus. The president, Edward Morgan Lewis, A.M., LL.D., Litt.D., assumed his duties Sept. 1, 1927.

NEW HAVEN. The largest city of Connecticut and the fourth city in size of New England; a manufacturing and educational centre. The population rose from 133,605 in 1910 to 162,537 in 1920, and to 187,900 in 1928, by estimate of the Bureau of the Census. New Haven industries cover a wide variety, including guns, ammunition, hardware, clocks and watches, rubber goods, corsets and clothing, machinery, machine tools, wire and wire goods, insulated wire and insulators, paper boxes, toys, automobile radiators, boilers, and cigars. In 1925, 22,863 persons were employed by 465 industrial establishments, and received \$28,463,797 in wages; the value of products manufactured was \$110,506,218. Transportation facilities in New Haven are excellent, the city being the hub of six lines of the New York, New Haven & Hartford Railroad. Nine other railroads maintain district offices there.

During the past few years, there has been a marked change in the business section of the city through the erection of a number of large office buildings, and in 1928 plans were adopted for the construction of the new City Hall. The educational facilities also have been expanded, including the construction of a commercial high school and two junior high schools and of a number of magnificent buildings at Yale University, chief of which are the Harkness Memorial Quadrangle, and the University Library. (See YALE UNIVERSITY.) More than 500 acres have been added to the city's park system, including shore frontage for a municipal park and bathing beach. Bank clearings in 1928 amounted to \$454,490,000, and building permits in 1927, to \$12,487,432. The assessed valuation of property in 1927 was \$315,738,000; the net debt was \$10,360,000.

NEW HEBRIDES. See PACIFIC OCEAN ISLANDS.

NEW JERSEY. The forty-fifth State in size (8224 square miles), and the tenth in population; capital, Trenton. The population increased from 2,537,167 in 1910 to 3,155,900 in 1920, a gain of 24.4 per cent; estimated population, 1928, 3,821,000. The white population increased from 2,445,894 (1910) to 3,037,087 (1920); Negro, from 89,760 to 117,132; native white, from 1,787,706 to 2,298,474, and foreign-born white, from 658,188 to 738,613. Urban population increased during the decade from 1,907,210 to 2,474,936; rural, from 629,957 to 680,964. The growth of the principal cities was as follows: Newark (q.v.), 347,469 (1910) to 414,524 (1920); Jersey City (q.v.), 267,779 to 298,103; Paterson (q.v.), 125,600 to 135,875; Trenton (q.v.), 96,815 to 119,289; Camden (q.v.), 94,538 to 116,309.

Agriculture. The development of agriculture has not kept pace with the growth in population, which increased during the decade 24.4 per cent, while the number of farms decreased 11.3 per cent, from 33,487 in 1910 to 29,702 in 1920, and stood in 1925 at 29,671. The acreage of land in farms decreased 15.7 per cent, or from 2,282,585 acres in 1920 to 1,924,545 in 1925. The improved land in farms in 1920 was 555,607 acres. The percentage of the total land area in farms decreased from 47.5

per cent in 1920 to 40 in 1925. The total value of farm property rose from \$254,832,665 in 1910 to \$311,847,948 in 1920, and remained at \$311,084,284 in 1925; the average value per farm was \$7610 in 1910, \$10,499 in 1920, and \$10,484 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 24,535 were operated by owners; 413, by managers; and 4723, by tenants. The corresponding figures for 1910 were 24,133; 1060; and 8294. White farmers in 1920 numbered 29,167 and colored farmers, 535. In 1910 the white farmers numbered 33,011 and colored farmers, 470. Farms reported as under mortgage, 10,085 in 1920, numbered 10,118 in 1925. The total number of cattle was 179,459 in 1920; 153,492 in 1925. Dairy cows numbered 172,693 in 1920; 122,384 in 1925. In 1920 sheep numbered 10,471; 5684 in 1925; swine, 139,222 in 1920; 55,854 in 1925. The estimated production of the chief farm crops in 1928 was as follows: Corn, 6,968,000 bushels; wheat, 1,200,000; oats, 1,500,000; rye, 758,000; potatoes, 9,120,000; sweet potatoes, 2,175,000; peaches, 1,625,000; and hay, 479,000 tons. Comparative figures for 1913 are corn, 10,862,000 bushels; wheat, 1,408,000; oats, 2,030,000; rye, 1,280,000; potatoes, 8,930,000, and hay, 469,000 tons.

Mining. New Jersey is one of the most important mineral-producing States in the eastern part of the country and it is the only east coast State that produces zinc. Although it has a considerable diversity of mineral products, the most important are clay and zinc. The values of the clay products have been \$16,484,652 (1914); \$20,741,244 (1918); \$40,021,028 (1920); \$27,214,685 (1921); and \$47,512,514 (1926). Zinc production was 74,253 short tons (1914); 112,020 (1916); 98,470 (1918); 77,371 (1920); 80,629 (1926). Cement also is one of the most important mineral products; shipments were 3,530,476 barrels, valued at \$3,081,205 (1914); 2,397,069, \$2,962,592 (1917); 2,563,453, \$5,096,558 (1920); 2,840,699, \$4,820,538 (1921). In addition to the minerals mentioned, the State produces a small quantity of iron ore and large quantities of sand, gravel, and stone. The total value of the minerals in 1926 was \$77,065,713, compared with \$72,335,207 in 1920; \$49,510,290 in 1918; \$31,756,503 in 1914; and \$56,898,033 in 1910.

Manufactures. New Jersey is one of the leading industrial States. In 1920 there were 39 cities having a population of more than 10,000. These contained 65.6 per cent of the total population of the State, and in 1919 reported 76.4 per cent of the State's manufactured products. There were in the State 8817 manufacturing establishments in 1909; 11,057 in 1919; 8204 in 1925; and 8312 in 1927. Wage earners in manufacturing numbered 508,686 in 1919; 423,377 in 1925; and 408,010 in 1927. The capital invested amounted to \$977,172,141 in 1909; and \$2,815,577,127 in 1919. The total value of the products was \$1,145,529,076 in 1909; \$3,672,064,987 in 1919; \$3,539,181,253 in 1925; and \$3,417,450,248 in 1927. The increase in value of products about 1919 was due largely to the change in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but a normal increase in number of wage earners and in number of establishments indicated a decided growth in the manufactur-

ing activities of the State. The most important industry in point of value of product is the refining of petroleum, valued in 1914 at \$90,877,000; in 1919, at \$280,995,000; in 1925, at \$297,288,102. The smelting and refining of copper ranks second: in 1909, \$125,651,000; in 1919, \$244,269,000; in 1925, \$224,039,089. Ship-building had a product valued at \$8,841,000 in 1909; \$11,861,000 in 1914, and \$238,015,000 in 1919; the extraordinary increase from 1914 to 1919 being due to the conditions resulting from the War. The three-year period from 1916 to 1919 showed an abnormal increase in vessels and gross tonnage launched, which renders comparison of little value. Silk goods, next in order, were valued in 1909 at \$65,540,000; in 1914, \$75,706,000, and in 1919, \$215,051,000. The most important manufacturing cities are Newark, Jersey City, Paterson, and Trenton. In Newark, there were 1857 manufacturing establishments in 1909, with a product valued at \$201,888,000; 2155 in 1919, at \$577,609,000; products in 1925 totaled \$490,047,000. In Paterson, there were 702 in 1909, \$69,263,000; 1044 in 1919, at \$216,659,000; in 1925 products were \$200,977,000. Jersey City had 745 manufacturing establishments in 1909, with a product valued at \$128,775,000; 896 in 1919, at \$374,183,000; products in 1925 were \$340,735,000. Similar figures for Trenton were 340 establishments, with a product valued at \$49,115,000 in 1909; 389, at \$122,478,000 in 1919; products of \$126,516,000 in 1925. Other important manufacturing cities are Camden, Bayonne, Hoboken, and Passaic.

Education. In recent years, notable progress has been made in educational matters in New Jersey. Much important legislation was passed. In 1919 there was established by law a new teachers' pension annuity system to supersede the old teachers' retirement fund. The new system operates on an actuarial basis; contributions from salaries of teachers are matched by the State, and this provides a pension of approximately half pay. A compulsory physical education law also was passed in 1919, and a continuation-school law, requiring children from 14 to 16 years of age to attend continuation classes six hours a week after working papers have been obtained. In 1922 provision was made for special aid by the State to school districts not able of themselves to provide satisfactory schools.

The complete survey of finances and business procedure of school districts which was made in 1921-22 resulted in improved methods in the handling of public moneys. A new normal school was opened at Glashborough in 1923, and in the same year plans were started for a new normal school in Jersey City. The enrollment in the public schools of the State increased from 501,948 in 1913 to 735,146 in 1925-26, and the number of teachers increased from 14,811 to 21,807. In the same period, the cost of education vastly increased, the cost per pupil, based on average daily attendance, being \$156.45 in 1925-26, as contrasted with \$43.72 in 1913. The chief item in this greatly increased cost was the much higher salaries for teachers. The percentage of illiteracy in the State decreased from 6.7 in 1910 to 6.6 in 1920; among the native white population, from 1.4 to 0.9 per cent; among the Negro, from 11.9 to 7.5; among the foreign-born white population, it increased from 14.8 to 16.3 per cent.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of State governmental departments, \$44,053,408 (of which \$16,896,733 was aid to local education); for conducting public-service enterprises, \$156,160; for interest on debt, \$3,071,760, for permanent improvements, \$24,709,156; total, \$71,990,484 (of which \$21,868,567 was for highways, \$6,100,970 being for maintenance and \$15,767,597 for construction). Revenues were \$76,045,226. Of this, property and special taxes formed 65.4 per cent; departmental earnings and charges for officials' services, 5.5 per cent; and sales of licenses, 19.7 per cent. The State at the time levied no sales tax on gasoline. Property valuation was \$6,111,703,758; State taxation thereon, \$36,545,466. Net funded State debt on June 30, 1927, was \$63,274,551; State highway debt, \$29,000,000.

Political and Other Events. Republican political strength in recent years has predominated except in the election of governors and senators, in which Democrats have at times been successful. In 1914 the Republicans elected a majority in both branches of the Legislature for the first time since 1911. They also elected eight Representatives in Congress, and the Democrats, four. In 1916 Walter E. Edge, Republican, was elected governor and Joseph S. Frelinghuysen to the Senate. In the presidential voting, Hughes received 268,982 votes; Wilson, 211,018. The voters of Newark, on Aug. 9, 1917, adopted a commission form a government. In 1919 the Democrats elected Edward I. Edwards governor, but the Republicans held the Legislature. In 1920 for President, Harding received 611,541 votes; Cox, 256,887. In 1922 the Democrats elected George S. Silzer governor, E. I. Edwards, United States Senator, and six Representatives in Congress. The Republicans held both Houses of the Legislature. The chief issue of the campaign was prohibition. The Democratic candidates for governor and U. S. Senator opposed the State Prohibition Enforcement Act and the Volstead Act. On Feb. 2, 1922, the State Court of Errors and Appeals held the State Prohibition Enforcement Law constitutional but "unworkable," and a new act was passed by the Republican Legislature. A contest in 1923 between Governor Silzer and the Legislature over the appointment of a new highway commission ended with the confirmation of the governor's nominations. The vote for President in 1924 was: Coolidge, 676,277; Davis, 298,043; LaFollette, 109,028. By popular vote in 1927, a measure to make State elections quadrennial, coinciding with national, was defeated. A. Henry Moore, Democrat, was elected governor in 1925. In 1928, his official acts were investigated by the Legislature, during the presidential campaign. The vote for President in 1928 was: Hoover, 925,796; Smith, 616,517. The Republicans elected Morgan F. Larson, governor.

Legislation. In 1914 the Legislature passed a home-rule act affording cities under a commission form of government greater latitude in the administration of local affairs. In 1914 it passed a concurrent resolution extending the suffrage to women. As the same resolution had already passed the preceding Legislature, it was submitted to the people, as noted above, on October 19, and was defeated. The Legislature of 1917 amended the health laws of the State in important details. In 1918 the

Legislature passed a local-option bill and a supplement to the corrupt-practices act and amended the child-labor and other laws. A workmen's-compensation bureau was created, as well as a department of charities and corrections with supervisory capacity over certain State institutions. The Legislature also created the Inter-State Bridge and Tunnel Commission, the Board of Fisheries, and Boxing Commission. In 1919 the laws relating to the State charitable, penal, and reformatory institutions were revised. This Legislature also passed a measure permitting a jury, as a part of its verdict, to recommend life imprisonment, in which case the death penalty shall not be imposed. The Legislature also enacted a child-labor law and passed measures forbidding the display of the red flag. The Legislature rejected the Federal prohibition amendment on Mar. 18, 1919. In 1920 it passed a measure permitting the manufacture and sale in the State of liquor containing 3.5 per cent alcohol. A bond issue of \$28,000,000 for the share of New Jersey in the Delaware Bridge between Camden and Philadelphia, and the Hudson River vehicular tunnel between Jersey City and New York, was authorized. In 1921 the Assembly ratified the Prohibition Amendment, but it was defeated by the Senate. The 3.5 per cent alcohol act was repealed. The Legislature created in 1921 the Department of State Police. This bill was vetoed by Governor Edwards, but was passed over his veto. In 1921 and 1922, the Legislature passed measures for the development of the port of New York, under a joint Port Authority of New York and New Jersey. The Legislature on Mar. 9, 1922, finally ratified the Eighteenth Amendment and passed laws for prohibition enforcement over the governor's veto. It authorized a bond issue of \$40,000,000 for the construction of good roads. In 1923 the Legislature passed a measure extending the payment of a soldiers' bonus to 1924, prohibited night work for women in factories after Dec. 31, 1924, and authorized cities to adopt the city-manager form of government. An act forbidding injunction against strike picketing was passed in 1926, and a motor vehicle department was created. A commission to reform the State's blue laws of ancient date was formed. Gasoline taxation was enacted in 1927. A zoning amendment to the constitution, later ratified, was passed; also an amendment, later rejected, to synchronize State and National elections.

NEW JERUSALEM, CHURCH OF THE. This organization, commonly known as the New Church, considers itself the organ of a new spiritual compensation and not a denomination of the historic Christian church, and teaches that the true doctrines of Christianity and the spiritual meaning of the Scriptures were revealed in the writings of Emanuel Swedenborg. The first organization, effected in London in 1787, was incorporated in 1821 as the "General Conference of the Ministers and other Members of the New Church signified by the New Jerusalem in the Apocalypse or Revelation of John," and the first local organization of the New Church in the United States was founded in 1792. The General Convention of the New Jerusalem in the United States of America was founded in 1817. Owing to the adoption of a stricter method of counting, involving also the omission of Canadian members, the General Convention declined in numbers of societies from 96 in 1814 to 85 in 1928, and in membership from 6423 to 5700. Home

and foreign missions, largely the work of the General Convention, were carried on during this period in the United States and foreign countries.

The General Church of the New Jerusalem. This body was organized in 1897 under episcopal government with headquarters at Bryn Athyn, Pa., a new community where the church established the following institutions; A cathedral of unusual architectural interest, built in the manner of the great cathedrals of the fourteenth century; the Academy of the New Church, which has a valuable museum and library and departments from kindergarten to junior college; and theological and normal schools, with an enrollment of 267 in 1928. The General Church differs from the older bodies in the New Church mainly in its stricter attitude toward the theological writings of Swedenborg (considering them to be the Gospel or Word of the Lord at his Second Advent) and in the endeavor to establish parochial schools. It had an international membership in 1928 of 1933 with 3 bishops, 35 pastors, 5 ministers, and 24 societies, 15 of which were in the United States and Canada, 2 in England, and others in Sweden, Holland, Belgium, France, Natal, New South Wales, and Brazil. Membership in the United States was 733, with 15 churches in 1916, and 996, with 13 churches in 1926. A native mission was carried on in South Africa, with headquarters at Alpha, O F S. Among the periodicals published by the General Church were *New Church Life*, its official monthly magazine, *New Church Sermons*, *The Journal of Education*, and *The Bulletin*.

The General Convention of the New Jerusalem in the United States of America. In 1928, the General Convention consisted of about 5700 communicant members, compared with 6352 in 1916, united into 85 societies, territorially organized as 12 associations and 7 societies. The ministerial membership was 115; and the amount expended for missions and benevolences for the year ending Apr. 30, 1928, was \$22,000, as compared with \$16,317 in 1916. Educational institutions of the General Convention included a theological school at Cambridge, Mass., a junior college at Urbana, Ohio, and the Waltham School for Girls, Waltham, Mass. Periodicals included: the *New-Church Messenger*, weekly, Brooklyn, N. Y.; the *New-Church Review*, quarterly, Boston, Mass.; the *New-Church League Journal*, monthly, Boston, Mass.; *The Helper*, weekly, Philadelphia, Pa.; and *Sunday Afternoons*, weekly, Boston, Mass.

The General Conference of the New Church. This body, which is organized in Great Britain and corresponds to the General Convention in the United States, is the largest organization of the New Church, its 70 societies reporting an adult membership of 6295, together with 656 "isolated receivers," 1053 junior members, and 5775 Sunday-school attendants, in 1928. The conference meets annually, the president holding office for one year. Its principal publications are *New Church Magazine* (quarterly) and *New Church Herald* (weekly). Publication societies are The Swedenborg Society (London, founded, 1810), Missionary and Tract Society, and Manchester New Church Publishing Society.

NEWMAN, HORATIO HACKETT (1875-). An American zoölogist, born near Seale, Ala., and educated at McMaster University and the University of Chicago. He was instructor in zoölogy at the University of Michigan (1905-

08); professor at the University of Texas (1908-11); and associate professor (1911-17), professor (1917-), and dean of the colleges of science (1915-22), at the University of Chicago. He published *The Biology of Turns* (1917); *Vertebrate Zoology* (1919); *Readings in Evolution, Genetics and Heredity* (1921); *The Physiology of Twinning* (1923); *Outlines of General Zoology* (1924); *The Gist of Evolution* (1926). He was editor of, and contributor to, *The Nature of the World and of Man* (1926).

NEW MEXICO. The fourth State in size (122,634 square miles) and the forty-third in population; capital, Santa Fe. The population increased from 327,301 in 1910 to 360,350 in 1920, a gain of 10.1 per cent; estimated population, 1928, 396,000. The white population increased from 304,594 (1910) to 334,673 (1920); Negro, from 1628 to 5733; native white, from 281,940 to 305,590; and the foreign-born white, from 22,654 to 29,077. Indians in 1920 numbered 19,512; in 1910, 20,573. The urban population of the State rose from 46,571 to 64,900; the rural, from 280,730 to 295,390. The only large city in the State, Albuquerque, increased from 11,020 in 1910 to 15,157 in 1920.

Agriculture. The number of farms, which

Mining. New Mexico is rich in mineral resources which have not yet been fully developed, principal among them, in the order of importance, being copper, coal, petroleum, and zinc. The progress of the mineral industry during the period starting with 1914 is indicated by production figures for the principal minerals. The coal production was 3,877,689 net tons, valued at \$6,230,871 in 1914; 3,793,011, \$5,580,369 (1916); 4,000,527, \$7,455,166 (1917); 4,023,239, \$10,787,082 (1918); 3,683,440, \$13,568,000 (1920); 2,453,482, \$9,585,000 (1921); 2,935,539, \$9,179,000 (1927). The increased values in 1920 and 1921 were due chiefly to the inflation of the currency and a corresponding decline in the purchasing power of money. The output of gold, copper, silver, lead, and zinc for several years during the period was as shown in the table. The decrease in production in 1921 was due largely to the depression in business conditions which affected metal mining. In addition to the minerals mentioned, the State produces iron ore, sand and gravel, and stone. The total value of mineral production in 1926 was \$28,513,991 as compared with \$27,883,565 in 1920; \$22,679,960 in 1919; \$40,631,024 in 1918, and \$18,072,919 in 1914.

OUTPUT OF MINERALS IN NEW MEXICO

Year	Copper Pounds	Gold Dollars	Silver Fine ounces	Lead Pounds	Zinc Pounds
1914	59,307,925	1,171,696	1,777,445	1,763,641	18,403,392
1918	98,264,563	682,791	782,421	8,398,239	24,050,324
1920	54,400,691	480,302	768,042	2,869,525	10,013,580
1921	14,267,338	196,822	571,899	678,601	228,000
1922	31,937,207	412,693	752,240	3,012,223	4,496,806
1927	74,251,863	604,483	890,083	16,052,855	59,603,000

in the previous decade had decreased 16.3 per cent, increased from 29,844 in 1920 to 31,687 in 1925. The acreage showed a decided increase from 11,270,021 (1910) to 24,409,638 (1920) and to 27,850,325 in 1925. The acreage of improved land in farms was 1,717,224 in 1920. The percentage of the State's total area used for agricultural purposes increased from 14.4 in 1910 to 31.1 in 1920 and 35.5 in 1925. The total value of farm property more than doubled from \$159,447,990 in 1910 to \$325,185,599 in 1920, but declined to \$236,300,563 in 1925, the average value per farm was \$4469 in 1910 and \$7457 in 1925. In interpreting these values the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 26,005 were operated by owners, 256, by managers; and 5426, by tenants. The comparative figures for 1920 were 33,398; 321; and 1957. White farmers in 1920 numbered 27,969, of whom 26,593 were native. Of the 1875 colored farmers, 1833 were Indians. White farmers in 1910 numbered 33,528; native white farmers, 32,081; and colored farmers, 2148. Farms reported as under mortgage numbered 6257 in 1920; 6897 in 1925. The number of dairy cows decreased from 45,827 in 1920 to 39,383 in 1925; "beef" cows numbered 797,077 in 1920; 691,672 in 1925. Sheep numbered 1,640,475 in 1920; 1,743,079 in 1925; swine, 87,906 in 1920; 55,431 in 1925. The area under irrigation increased from 461,718 acres in 1909 to 538,377 in 1919. The estimated production of the principal farm crops in 1928 was as follows: Corn, 3,482,000 bushels; wheat, 2,054,000; oats, 720,000; and hay 437,000 tons. Comparative figures for 1913 are corn, 1,572,000 bushels; wheat, 1,221,000; oats, 1,500,000; barley, 96,000; potatoes, 612,000; and hay, 399,000 tons.

Education. There has been steady development in education in New Mexico throughout a long course of years. The elementary schools undertook to furnish education not only in the essential branches but also in vocational training, including agriculture, domestic science, and manual training. The secondary schools during the era of Statehood showed a remarkable increase in their development, both in number and in the ratio of attendance. In addition to these educational activities, the State provided for the education of the blind and the deaf and dumb. The county unit for administration purposes was developed in 1913 and supplemented by the county unit law of 1915 for purposes of taxation. In 1921 the Legislature made provision for an educational auditor, whose duty it was to assist the various agencies throughout the State in the preparation of their financial budgets. The State, in 1917, took advantage of the Federal act which furnished aid to the States for the development of vocational education; under the provisions of the State law, the Board of Education served also as the Vocational Board of Education; and vocational education was provided in both day and night schools. Vocational rehabilitation was also established with very satisfactory results. The total enrollment in the State in 1914 was 67,147. It rose to 87,087 in the year 1925-26, of this number, 79,529 were pupils enrolled in kindergarten and elementary grades and 8158 in high schools. Expenditures for the public day schools in the State in the year 1925-26 were: current, \$4,894,309; outlays for new buildings, sites, and equipment, \$359,590. The percentage of illiteracy in the State decreased from 23.4 in 1910 to 18.9 in 1920; among the native white population in the same

period it declined from 18.8 to 15.2; among the foreign-born, from 31.2 to 28.6; among the Negro, from 15.0 to 4.4.

Finance. State expenditures in the year ended June 30, 1927, according to the U. S. Department of Commerce, were: for maintenance and operation of State governmental departments, \$4,917,254 (of which \$1,115,808 was aid to local education); for interest on debt, \$176,495; for permanent improvements, \$3,052,077; total, \$8,146,096 (of which \$3,946,731 was for highways, \$996,097 being for maintenance and \$2,950,634 for construction). Revenues were \$6,998,951. Of this, property and special taxes formed 27.6 per cent, departmental earnings and charges for State officials' services, 12.7 per cent; sales of licenses and taxation of gasoline, 21.5 per cent. Property valuation was \$315,373,405, State taxation thereon, \$2,623,523. Net funded State debt on June 30, 1927, was \$3,321,279. Highway bonds totaling \$2,670,000 were outstanding.

Political and Other Events. In 1914 three amendments to the State constitution were voted on and carried. One of these provided that State and county officials might succeed themselves. Another reduced the term of State and county officials from four to two years, and a third repealed the clause on taxation in the constitution and eliminated the State Board of Equalization. In 1916 the Democrats carried the State, electing A. A. Jones to the Senate. For President, Wilson received 33,527 votes; Hughes, 31,152. The Democratic candidate for governor, E. C. De Baca, was elected. In 1918 the Republicans elected their candidate for governor, O. A. Larriozolo. Albert B. Fall, Republican, was elected United States Senator. In 1920 Merritt C. Mechem, Republican, was elected governor. Harding received 57,634 votes for President; Cox, 46,668. Senator Fall became Secretary of the Interior, and Holm O. Bunsum, Republican, was elected senator. The Democrats regained power in 1923, electing James F. Hinkle governor, and reelected Senator Jones for the Senate. The presidential vote in 1924 was Coolidge, 54,745; Davis, 48,542; LaFollette, 9543. Merritt C. Mechem was elected governor in 1920, James F. Hinkle in 1922, Arthur T. Hannett (Democrat) in 1924, and Richard C. Dillon in 1926. In 1928 the vote for President was Hoover, 69,618; Smith, 48,095. Dillon (Republican) was reelected governor. A measure to increase the term of governors to four years was passed and approved by popular vote in 1927.

Legislation. The Legislature of 1917 enacted a workmen's-compensation law and amended the statutes relating to the administration of justice. In 1919 the Legislature amended the tax laws. It also provided for the recodification of the general banking law and authorized the commission form of government in cities of 10,000 or more population. In 1921 the Legislature made additional provisions for the protection of game, regulated the hours of labor for children, created the office of county flood commissioner, and provided for emergency flood districts and their administration. It also provided for a succession tax, created a Department of Public Welfare, and regulated and limited the working hours of women. The Legislature of 1923 proposed an amendment to increase the term of State officers in the State executive department and county officers from two to four years. The

Colorado River Compact was accepted in 1925, and a child-labor act was passed.

NEW ORLEANS, Or'lé-anz. The largest city of Louisiana and a port of entry. The population rose from 339,075 in 1910 to 387,219 in 1920 and to 429,400 in 1928, by estimate of the U. S. Bureau of the Census. Of the 1928 total, 26.1 per cent was Negro and 6.7 per cent, foreign-born. The area is 196 square miles. As a result of the election on Apr. 17, 1928, New Orleans has been enabled to finance needed public improvements without obtaining the approval of the entire State electorate on bond issues for water, sewer, and drainage extensions within the city. The bonds are now approved by the local taxpayer electorate and three local authorities the City Council, the Sewerage and Water Board, and the Board of Liquidation of the City Debt. The Planning and Zoning Commission has had prepared for the consideration of the City Commission a comprehensive city plan.

The most extensive work carried on by the city since 1914 was the improvement of the port of New Orleans by the construction of the Inner Harbor Navigation Canal. This canal, which joins the Mississippi River and Lake Pontchartrain, connecting with the Gulf of Mexico, is five and one-third miles long and 30 feet deep at low water. It is equipped with a concrete and steel lock 640 feet long and 75 feet wide which permits the passage, even at low water, of 20,000 ton vessels with a draught up to 30 feet. This lock, which was built under the direction of General George W. Goethals, has 75 per cent of the capacity of the bigger lock of the Panama Canal. With the completion of this undertaking in 1923 at a cost of \$20,000,000, the water frontage of the port of New Orleans was increased to 52 miles. Sufficient land was acquired within the canal reservation to afford approximately 100,000 acres for industrial development. The river front and Navigation Canal banks are owned and operated by the State of Louisiana and supervised by the Board of Port Commissioners. The municipally-owned Public Belt Railroad affords convenient connection between the water-front facilities, the 12 railroad lines serving New Orleans, all terminals, and local industries requiring switching service.

The equipment of the port of New Orleans includes a public grain elevator holding 2,622,000 bushels of grain, the public cotton warehouse and wharf with a capacity for storing 461,800 bales of cotton, a bulk commodity handling plant, the banana dock with banana conveyors which handle 23,000,000 bunches each year, a huge ore and coal handling plant, and 7 miles of covered wharf sheds including the newly-completed \$2,000,000 coffee terminal and the Federal barge terminal. The tonnage of the port in 1927 was 7,697,000 long tons in foreign commerce alone, ranking third to New York. Coastwise cargoes increased from 357,907 tons received in 1917 to 1,689,011 tons in 1927 and from 1,256,214 tons shipped in 1917 to 3,756,654 tons in 1927. The Federal barge line (Mississippi-Warrior Service) handles, between St. Louis and New Orleans, a total of more than 1,250,000 tons of Mississippi Valley commerce.

In 1927, in order to afford a shorter route to the city, there was constructed across Lake Pontchartrain the longest concrete highway bridge in the United States. This structure is more than 5 miles long and cost approximately \$5,000,000 to erect. In 1929 the State of Louisiana con-

structed two additional concrete and steel highway bridges near the city at a cost of approximately \$2,000,000, so as to provide an additional artery of traffic and eliminate the necessity of ferry crossings in approaching the city from the north. The city of New Orleans also has undertaken the erection of a municipal auditorium to cost \$2,000,000 and the new Criminal Court Building to cost \$1,000,000 and, through the sewerage and water board, has been authorized to expend approximately \$14,500,000 in expanding and improving the drainage and water-supply system. Through the destruction of cisterns, the installation of a model water purification plant, the rat-proofing of public buildings and docks, and the installation of an elaborate drainage system, yellow fever, malaria, typhoid, and bubonic plague all have been practically eliminated from the health records of the city.

Recently under the direction of the Orleans Parish Levee Board the reclamation of approximately 5 miles of lake front has been started, the new land being created entirely with sand pumped from the bottom of Lake Pontchartrain. Residential districts, parks, bathing beaches, drives, recreation fields, airports, and hotel sites will be provided. The ultimate cost of the improvement, which was voted as a constitutional amendment by the people of the State, is estimated to be \$41,000,000.

New Orleans has two commercial airports: the Alvin Callender Airport on the west side of the Mississippi River and 8¾ miles distant therefrom and the Menefee Airport located 6 miles east of the city on the east bank of the Mississippi. The adoption of an amendment to the State constitution in 1928 makes available a municipal airport to be erected by the Orleans Parish Levee Board on the shores of Lake Pontchartrain, 6 miles north of the city. The airport will be 3000 feet long by 3000 feet wide, with sufficient additional area to permit of expansion, and will be equipped with the most modern facilities for the accommodation and serving of both land and water planes.

Within recent years, a tendency has developed among the wealthier citizens of New Orleans to buy and restore old houses in the Vieux Carré, the city's historic quarter, so as to insure their preservation. The famous Patio Royale has been presented to Tulane University, and the Spanish Brulatour mansion now houses the Arts and Crafts Association. The Cabildo, where in Spanish days the governing body of the province used to convene and in which the ceremony of the transfer of Louisiana from France to the United States took place, has been converted into a State museum. The French Opera House was destroyed by fire in 1919. It had been, since its erection in 1859, one of the most famous centres of music in the United States.

New Orleans is the home of the Permanent International Trade Exhibition of the United States. More than 300 industries from 24 States and 11 foreign countries maintain permanent exhibits in the exhibition building which was erected by the United States government at a cost of \$5,000,000. In 1925, 22,118 persons were employed in New Orleans' 1200 industrial establishments and received \$20,291,000 in wages; the value of products manufactured was \$155,106,000.

The public-school system of New Orleans consists of 86 elementary schools, six high schools, one normal school, one industrial school for girls

(the Nicholls Industrial School), 15 elementary evening schools, and one evening school for foreigners. There are 19 elementary public day schools for Negroes, one public high school, and 6 elementary evening schools. The public-school enrollment in 1926-27 was 65,590. The parochial schools provided by various denominations consist of 45 elementary schools, three high schools, and five academies. The Delgado Central Trade School is a public institution endowed for more than \$1,000,000 and ranking among the first five trade schools in the United States. It provides training in 12 different trades for 1600 boys.

New Orleans is an important financial centre of the South, its bank resources increasing from \$186,684,574 in 1917 to \$330,171,880 in 1927. The value of building permits issued by the city increased from \$2,814,051 in 1917 to \$16,011,635 in 1927 and property valuation from \$443,157,725 in 1917 to \$516,023,000 in 1927. The city's net debt in 1927 was \$49,206,000.

NEW SOUTH WALES. A constituent state of the Commonwealth of Australia in the southeastern part of the continent. Area, 310,372 square miles; population in 1911, 1,650,470; in 1921, 2,100,371, average annual increase, 2.4 per cent. The population on Mar. 1, 1928, was 2,415,511. Sydney, the capital and largest city, with suburbs, had 1,101,190 inhabitants in 1927 (629,503 in 1911). Area under crops in 1912-13, 3,737,105 acres; in 1925-26, 4,543,541. Principal crops are wheat, maize, barley, oats, potatoes, and hay. Cane sugar, grapes, and citrus fruits are receiving increasing attention. Grazing is of course a leading activity. Wool production in 1926-27 was 499,320,000 pounds (326,804,000 pounds in 1912-13). Mining in 1927 yielded (1912 figure in parentheses): gold, £76,595 (£702,129); silver and silver-lead ore, £3,487,980 (£3,481,266); tin, £287,539 (£338,074); copper, £12,655 (£579,791); zinc, £996,877 (£1,766,242); coal, £9,782,002 (£3,660,015); iron, £654,230 (£130,708). Manufacturing pursuits engaged 183,193 employees in 1926-27 (115,561 in 1912). Metal works and machinery, and plants concerned with food industries, are the most important. In 1926-27 the value of production of the various industries was: pastoral, £47,822,000; agricultural, £22,098,000; dairying, £14,591,000; forests and fisheries, £6,147,000; mining, £12,352,000; manufacturing, £69,849,000; total, £172,859,000. Imports overseas for 1913 and 1928 were £32,350,600 and £65,072,266; exports for the same years, £32,839,800 and £51,882,929. Leading exports are minerals, wool, dairy products, and meats. On Mar. 31, 1928, 5868 miles of government railways were open; in 1913, the number had been 4197. Total revenues of the Government for 1913-14 and 1927-28 were £18,438,228 and £47,997,372. Expenditures for the same years were £18,065,189 and £48,857,763. The public debt on June 30, 1913, was £106,170,747; by June 30, 1928, it had increased to £245,247,907. The Labor Party gained its first impetus in New South Wales and has controlled the Government more or less regularly.

NEW YORK. The twenty-ninth State in size (49,204 square miles) and the first in population; capital, Albany. Population by the State census of 1925, 11,162,151; estimated population 1928, 11,550,000. The population increased from 9,113,614 in 1910 to 10,385,227 in 1920, or by 14 per cent. Whites increased in number

from 8,966,845 to 10,172,027; Negroes, from 134,191 to 198,483; native whites, from 6,237,573 to 7,385,915; and foreign-born whites, from 2,729,272 to 2,780,112. Urban population rose from 7,185,494 to 8,589,844; rural decreased from 1,907,210 to 1,795,383. The growth of the principal cities was as follows: New York (1910), 4,766,883 to (1920) 5,620,048; Buffalo, 423,715 to 506,775; Rochester, 218,149 to 295,750; Syracuse, 137,249 to 171,717; Albany, 100,253 to 113,344 (see articles on these cities).

Agriculture. New York, in common with nearly all the Eastern States, has shown a decline in agriculture in recent years, as compared with growth of population. The number of farms decreased 10.4 per cent or from 215,597 in 1910 to 193,195 in 1920, and decreased 2.3 per cent from 1920 to 1925, or to 188,754; total acreage in farms fell from 20,632,803 in 1920 to 19,269,926 in 1925, or 6.6 per cent. The improved land in farms was 13,158,781 acres in 1920. The total value of farm property rose from \$1,451,481,495 in 1910 to \$1,908,483,201 in 1920, but declined to \$1,700,929,770 in 1925; the average value per farm was \$6732 in 1910, \$9879 in 1920, and \$9043 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 159,949 were operated by owners; 2261, by managers; and 26,544 by tenants. The corresponding figures for 1910 are 166,674, 4051; and 44,872. White farmers in 1920 numbered 192,645 and colored farmers, 550. In 1910 the white farmers numbered 214,658 and the colored farmers, 939. The total number of cattle in 1920 was 2,144,244; in 1925, 1,836,900. The increase in the number of dairy cows from 1,509,594 (1910) to 2,081,074 (1920) was reversed thereafter, they numbered 1,370,060 in 1925. The State held second place in milk production, being exceeded only by Wisconsin. Sheep numbered 578,726 in 1920; 472,616 in 1925, swine, 600,560 in 1920, 259,189 in 1925. The estimated production of the principal crops in 1928 was as follows: Corn, 22,100,000 bushels, wheat, 4,702,000; oats, 33,660,000, rye, 758,000; barley, 4,648,000; potatoes, 32,376,000, buckwheat, 3,475,000; apples, 21,900,000; and hay, 6,513,000 tons (comparative figures for 1913 are corn, 15,020,000 bushels; wheat, 6,800,000; oats, 42,712,000, rye, 2,228,000; barley, 2,056,000; potatoes, 26,640,000, hay, 5,358,000 tons; and tobacco, 4,386,000 pounds).

Manufactures. New York is the most important of the manufacturing States, both in point of the number of establishments and in value of product. In 1920 there were 58 cities with more than 10,000 inhabitants. These formed 78 per cent of the total population of the State and in 1919 reported 87.5 per cent of the State's manufactured products. There were 44,935 manufacturing establishments in the State in 1909, 49,330 in 1919, 33,392 in 1925; and 36,650 in 1927. Wage earners in manufacturing numbered 1,228,130 in 1919; 1,066,198 in 1925; and 1,072,284 in 1927. Capital invested amounted to \$2,779,496,814 in 1909 and \$6,012,082,567 in 1919. The value of products amounted to \$3,369,490,192 in 1909; \$8,867,004,906 in 1919; \$8,968,262,479 in 1925; and \$9,406,751,185 in 1927. The large increase in the value of products about 1919 was largely due to changes in industrial conditions brought about by the War and cannot be properly used to measure the

normal growth of manufactures during the period; but an increase in the number of wage earners clearly indicated decided growth in the manufacturing activities of the State. The most important industry in the State is the manufacture of women's clothing, the product of this industry, valued at \$272,518,000 in 1909, reached \$345,316,000 in 1914, and \$886,984,000 in 1919. The manufacture of men's clothing ranks second in point of value: \$266,075,000 in 1909; \$238,027,000 in 1914; and \$641,906,000 in 1919. The production of both kinds of clothing in 1925 was \$1,495,741,841. The refining of sugar attained totals valued at \$124,941,000 in 1914, and at \$268,318,000 in 1919. Slaughtering and meat packing had a product valued at \$127,130,000 in 1909 and at \$265,726,000 in 1919. The printing and publishing product was \$216,946,000 in 1909, \$478,898,000 in 1919; and \$358,009,036 in 1925. The most important manufacturing cities are New York, Buffalo, and Rochester. In New York, there were 25,933 manufacturing establishments in 1909, with a product valued at \$2,027,425,000; 32,590 in 1919, with \$5,260,708,000, in 1925, the production was valued at \$5,324,414,000. Buffalo had 1753 establishments in 1909, with a product valued at \$218,804,000; 2093 in 1919, with \$634,410,000; and production in 1925 valued at \$675,436,000. Similar figures for Rochester were: 1203 in 1909, with \$112,676,000, 1367 in 1919, with \$351,416,000, and in 1925 production totaling \$337,548,000. The other important manufacturing cities are Albany, Binghamton, Niagara Falls, Schenectady, Syracuse, Troy, Utica, and Yonkers.

Mining. Although New York has limited metal mining, it ranked fourteenth among the States in 1926 in the value of its mineral products. The most important minerals are clay, gypsum, cement, and stone. The progress of the clay and cement industries subsequent to 1914 was as follows: In 1914 clay products were valued at \$9,078,933, in 1916, \$11,755,012; 1920, \$19,113,684; 1921, \$17,432,086; 1926, \$28,999,053. Shipments of cement in 1914 were 5,713,383 barrels valued at \$5,143,401, 1916, 5,707,892 barrels, \$5,804,444, 1918, 4,074,150, \$6,568,746; 1921, 4,993,341, \$9,403,015; 1926, 8,535,862, \$14,864,066. It will be noted that while the shipments of cement were lower in 1921 than in 1914, the price received was almost double, which was due chiefly to the inflation of currency. In addition to these two minerals, the State produces graphite, a considerable quantity of iron ore, mineral waters, natural gas, petroleum, and sand and gravel. The total value of the mineral production in 1926 was \$112,016,262, compared with \$78,431,317 in 1920, \$56,379,564 in 1919; \$52,768,877 in 1918; and \$36,420,134 in 1914.

Education. There has been a great development in education in New York during the years subsequent to 1914. In 1914 the establishment of the central rural schools was made possible. In 1917 a measure was passed providing for central high-school districts; school elections in certain cities were regulated by the Legislature. In 1921 and 1922 the laws relating to compulsory education were amended. In 1923 a law was passed providing for State schools of agriculture in St. Lawrence, Alfred, Morrisville, Cobleskill, Delhi, and Farmingdale, under the supervision and direction of the Regents of the University and the Commissioner of Education. Vocational education in general industrial schools,

trade schools, schools for agriculture and home economics (also in part-time or continuation schools) was being carried on in all the larger and most of the smaller cities of the State. The benefits of the Smith-Hughes Act providing for vocational education were accepted by a legislative measure in 1917. Farm schools were established throughout the State. The number of public school pupils enrolled increased from 1,532,151 in 1915 to 1,967,447 in 1925-26; of this number, 1,643,215 were enrolled in kindergarten and elementary grades; 324,232 in high-school grades. The percentage of illiteracy in the State decreased from 6.6 in 1910 to 6.4 in 1920: among the native white population, from 1.1 to 0.7 per cent; among the Negro, from 5.8 to 3.4; among the foreign-born white population, it increased from 14.3 to 15.2 per cent.

Finance. State expenditures in the year ending June 30, 1928, as reported by the United States Department of Commerce, were: for maintenance and operation of departments, \$169,727,420 (of which \$71,550,099 was for local education); for interest on debt, \$14,200,688; for permanent improvements, \$52,830,044; total, \$236,758,152 (of which \$51,502,063 was for highways, \$24,763,275 being for maintenance and \$26,738,788 for construction). Revenues were \$240,199,580; of this, property and special taxes formed 56.1 per cent; departmental earnings, 3.3 per cent; receipts from licenses, 30.4 per cent. Assessed property valuation was \$22,958,837,107; State taxation thereon, \$24,897,004. Net State debt on June 30, 1928, was \$259,602,471.

Political and Other Events. The political complexion of the State of late years has been chiefly Republican on national issues and Democratic in elections of governors. New York City has remained Democratic. Gov. Martin H. Glynn, who succeeded to the post on the impeachment and removal of Governor Sulzer in 1913, was in 1914 the Democratic candidate for governor; he was defeated by the Republican nominee, Charles S. Whitman. James Wadsworth, Jr., Republican, was elected senator. At this election, delegates to a constitutional convention were chosen. In February of this year, Joseph Cassidy, former Democratic leader of Queens Borough of New York City, was convicted of selling a nomination for the Supreme Court. William Willett, who paid Cassidy \$25,000 for the nomination, was convicted with him. The constitutional convention, authorized in 1914, met on Apr. 5, 1915, and sat until September 9. The constitution that it shaped was defeated by a popular majority of 470,000; woman suffrage, by a vote of more than 200,000. In 1916 Senator Root declined renomination and the Republicans elected William M. Calder. Governor Whitman was reelected.

For President, Hughes received 863,841 votes in 1916; Wilson, 756,946. In 1917 Mayor Mitchell was a candidate for reelection as Mayor of New York City, but the Democrats elected John F. Hylan. On Oct. 12, 1917, the Catskill aqueduct carrying water to New York City was opened. In June, 1917, a census of all persons of the State under the age of 45 years was taken, with the purpose of assigning war service. In 1918 nominations were made for governor and other State officers at regular State primaries; the State convention had been abolished. Charles S. Whitman was renominated by the Republicans, and Alfred E. Smith, president of the Board of Aldermen of New York City, by

the Democrats. Smith was elected by a close vote. In 1920 Nathan L. Miller was elected governor by the Republicans, defeating Governor Smith. James W. Wadsworth, Jr., was reelected to the Senate. For President, Harding received 1,868,240 votes; Cox, 781,485. At this election a referendum for a soldiers' bonus providing for a bond issue of \$45,000,000 was approved. Investigations by a legislative committee in 1920 exposed much corruption in the building trades. In 1921 Hylan was reelected Mayor of New York City by a plurality of more than 400,000 votes. At this election several amendments to the constitution were carried. One of these provided for a literacy test for voting, including the requirement that the voters should know the English language.

The Court of Appeals on Aug. 31, 1921, declared the Bonus Act of 1920 unconstitutional. In 1922 a new election law went into effect, providing that Judges and United States Senators were to be nominated by the convention, while candidates for the House of Representatives, for State Legislature, and for local officers were to be nominated by primaries. For governor, Nathan I. Miller ran again and was defeated by Alfred E. Smith. For United States Senator, Dr. Royal S. Copeland was nominated by the Democrats and was elected. In the Legislature, the Democrats secured a majority of one in the Senate, while the Republicans retained control of the Assembly. On Mar. 31, 1923, the Supreme Court held that the Anti-Saloon League was a political organization subject to the corrupt-practices law, and it was required to file a verified statement of campaign expenditures. In the election of November, 1923, a constitutional amendment providing for absentee voting was carried by a large majority. Another measure sanctioning a \$50,000,000 bond issue for State hospitals also was carried, and so was the proposal for a soldiers' bonus. On Dec. 9, 1923, the Cayuga Indians, after 111 years of exclusion, regained their representation in the supreme council of the Six Nations of the Iroquois Confederacy. An inquiry was carried on in the House of Representatives in 1924 in regard to the right of Sol Bloom, elected on June 28, 1923, to sit as a member. It was charged by his Republican opponent, W. M. Chandler, that he had been elected by corrupt methods. The investigating committee decided in favor of Bloom.

In 1924 the vote for President was: Coolidge, 1,820,058; Davis, 950,796; LaFollette, 467,293. Smith was reelected governor. As a result of enactments at a special session of the Legislature in 1925, the State entered on a programme of \$10,000,000 expenditure yearly for 10 years, to be defrayed by bonds, to modernize State institutions. It also undertook a \$300,000,000 plan for the elimination of grade crossings of railroads and highways. James J. Walker, Democrat, was elected Mayor of New York in 1925. Smith was reelected governor in 1926, and the voters gave a heavy majority for a referendum proposal looking to modification of the Volstead Act. In 1927 the voters rejected a proposed constitutional amendment to make State office terms quadrennial, with elections coinciding with those of Presidents; they approved amendments creating an executive budget, exempting water-supply debt from city debt limits, and granting exemption from debt limit to New York City for \$300,000,000 of subway

construction. Mrs. Florence E. S. Knapp, ex-Secretary of State, was convicted in 1928 of criminal irregularity in expenditure of State funds provided for the State census of 1925. The presidential vote in 1928 was: Hoover, 2,193,344; Smith, 2,089,863. Franklin D. Roosevelt, Democrat, was elected governor.

Legislation. The Legislature in New York meets annually. In 1914 it passed a measure providing pensions for widowed mothers. The Legislature in 1917 created a State food supply commission and provided for compulsory military training for boys between the ages of 16 and 18. The public-health law was amended and a State constabulary force was authorized. The Legislature of 1919 passed an income-tax law. This Legislature also passed a measure repealing the statute punishing as a crime attempts to commit suicide. At the legislative session of 1920, five Socialist members of the Assembly, who were charged with disloyalty, were expelled. Three sedition laws passed by the Legislature were vetoed by the governor, and so were laws making Socialists ineligible for political office. In 1921 the Legislature reorganized the Public Service Commission and created a transit commission for New York City. It repealed the presidential-primaries law and abolished the direct primary for United States Senator, State Supreme Court judges, and officers elected by the State at large. It also provided for the enforcement of prohibition and the Volstead Act by local authorities. A measure was enacted providing for a bi-State Port of New York Authority to carry out works for the improvement of New York Harbor, under a compact with the State of New Jersey.

The Legislature of 1922 passed several bills for the relief of the housing situation. This Legislature also created a Veterans' Relief Commission and by an amendment to the marriage law it made absence for five years a ground for divorce. In 1923, because of judicial decisions that had made it possible to try prohibition offenders in Federal and again in State tribunals for one and the same act, the Legislature repealed the Mullan-Gage Prohibition Enforcement Law so as to leave the enforcement of prohibition in the State entirely under Federal law. At this Legislature, a measure was passed compelling the Ku-Klux Klan to abandon secrecy in its practices. A measure also was passed making a robber who uses an automobile or motor vehicle in the commission of crime guilty of robbery in the first degree. The Legislature also passed a measure intended to reorganize the administrative machinery of the State government by abolishing the election of secretary of State, treasurer, and State engineer and surveyor. In 1924 a compromise transit law was passed which gave New York City power to complete and control new subways. The income-tax law was revised.

Particularly important to the water needs of New York City, a water compact for the joint utilization of the Delaware River was executed by New York, New Jersey, and Pennsylvania in 1925, but the latter two States had not ratified this compact up to the end of 1928. An enactment of 1925 imposed a tax on decedents' estates. In 1926 an executive budget was provided and the State administration was reorganized so as to merge some 180 bodies into 18 departments. The State Water Power Commission, which had antagonized the water-power policy

of Governor Smith, was abolished. In 1926 and again in 1927, a constitutional amendment was passed to extend the terms of elective State officers to four years, their election to coincide with that of Presidents; this was submitted to popular vote and was rejected thereby in 1927. A series of amendments of the criminal law, recommended by the Baumes Commission, were passed, 1926-28; they provided increasing penalties for repeating offenders, up to life imprisonment. The child-labor law was made in 1928 to apply in some respects up to the age of 17.

NEW YORK. The largest city and seaport of North America. The population increased from 4,760,883 in 1910 to 5,620,048 in 1920, to 5,873,356 in 1925 (State census), and to 6,017,500 in 1928, according to estimate of the U. S. Bureau of the Census. In 1928 the population was distributed in the boroughs as follows (State figures for 1925 in parentheses): Manhattan, 1,752,000 (1,945,029); the Bronx, 951,900 (872,168); Brooklyn, 2,308,500 (2,203,991); Queens, 854,400 (713,891); and Richmond, 150,700 (138,277). These figures indicate the stationary position of the Borough of Manhattan and the extraordinary growth of Queens and Brooklyn. The area is 316 square miles.

Many elaborate enterprises have been carried out by the city since 1914, but most significant has been the work of the Port of New York Authority. In 1921 the State of New York and New Jersey entered into a compact which was ratified by the Congress of the United States, creating the Port of New York Authority and charging it with the duty of developing the Port of New York, particularly with reference to freight-handling facilities. The Port Authority consists of three Commissioners from each State and functions independently of legislative control. This body has jurisdiction over an area of 1403 square miles with a water frontage of 771 miles, 578 miles of which are in New York and 193 miles in New Jersey. Along this water front, there are more than 850 piers, and it is estimated that more than 75,000,000 tons of freight annually move in and out of the port. Of this amount, 40,000,000 tons are transported by steamships, there being approximately 200 companies operating ships in and out of the port. The foreign commerce of the port in 1927 amounted to 25,275,933 tons, of which 13,315,114 tons were imports and 11,960,819 tons exports. In 1928, a total of 6761 vessels of 29,066,546 tons entered the port, and 6830 vessels of 29,248,183 tons were cleared.

Development of the port has gone steadily forward since 1920. During 1920-22, 12 piers between 1026 and 1137 feet long and from 125 to 209 feet wide were built on Staten Island, with rail connection with the main railroads of New Jersey. The City of New York extended a number of its piers on the North River to accommodate the ever-increasing size of ocean vessels and in 1920, without success, requested the United States War Department to permit the construction of still longer piers. In addition to the construction of the 40-ft. Ambrose Channel, with its illuminated buoys permitting access to the harbor of the largest vessels, extensive dredging was carried on to provide a 40-ft. channel between the Upper Bay and Brooklyn and to remove various reefs in the East River. In 1925 the construction of a 30-ft. channel in Jamaica Bay was undertaken. The total cost of the improvement was estimated at approximately \$29,000,000,

\$12,000,000 to be contributed by the Federal government and \$17,000,000 by the City of New York. The work involved the excavation of about 16,000,000 cubic yards of sand, which was deposited upon the city-owned land adjacent to the channel. Jamaica Bay covers 32 square miles of area and has 25 miles of direct water frontage.

In connection with the development of the New York State Barge Canal, the State constructed at Piers 5 and 6 in the East River a terminal basin for barge fleets. There were also erected at Gowanus Bay, Brooklyn, a bulkhead wall 900 feet long and a pier 1200 feet long, a steel freight house, and a \$2,000,000 grain elevator with a capacity of 2,000,000 bushels. These terminals are operated under the direction of the Commissioner of Canals and Waterways in the Department of the State Superintendent of Public Works. In 1929 the New York Dock Company was constructing along its two and a half miles of waterfront on the Brooklyn shore additional manufacturing and storage buildings involving an expenditure of \$10,000,000.

Improvements carried out by the Port of New York Authority have included the construction of Belt Line 13 from Edgewater to Bayonne, N. J., and the establishment of the first of a series of inland freight stations serving 11 trunk railroad lines. These stations are to be located conveniently with respect to shippers and receivers, and are to be served from the various railroad terminals by a system of motor trucks and later by underground rail connections.

New York, which long has had a notable group of suspension bridges across the East River, has continued bridge construction. In 1917 the Hell Gate railroad bridge was built over the East River from Long Island to the Bronx, a distance of more than three miles, with a single steel arch of 1000-ft. span and a long concrete viaduct; over this bridge are routed fast passenger trains from New England to the South and West via the Pennsylvania Terminal. In 1923, in accordance with orders from the War Department, the stone piers of the High Bridge in the Harlem River were replaced by a single steel arch with a span of 425 feet and a navigation clearance height at the centre 100 feet above mean high water; the cost of the project was approximately \$716,000. The Port of New York Authority, on assuming office, was directed by the States of New York and New Jersey to construct four interstate bridges, the funds being realized from the sale of Port Authority bonds, supplemented by certain advances made by the States. Between 1926 and 1928, two bridges were constructed across the Arthur Kill, connecting Staten Island and New Jersey, at a cost of approximately \$18,000,000. The southern bridge with a 750-ft. central span crossed between Perth Amboy, N. J., and Tottenville, S. I., and was named the Outerbridge Crossing in honor of E. H. Outerbridge, the first chairman of the Port of New York Authority. The northern structure, also of the cantilever type but with a somewhat smaller span, was named the Goethals Bridge in honor of the famous army engineer; it crossed from Elizabeth, N. J., to Howland Hook, S. I. In 1928 construction was begun on a third bridge across the Kill van Kull from Bayonne, N. J., to Port Richmond, S. I. When completed in 1932, it will be the longest bridge of its type in the world, its span of 1675 feet exceeding by 25 feet the steel arch of the newly-constructed bridge

over Sydney Harbor in Australia. The cost of construction was estimated at \$16,000,000.

On Sept. 21, 1927, ground was broken for the construction of the mammoth double-deck suspension bridge between Fort Washington in Manhattan and Fort Lee in New Jersey. The bridge, which is scheduled for completion in 1932, will be the longest suspension bridge in the world and will cost approximately \$60,000,000. Its single span of 3500 feet will have a clear height above water of about 200 feet. In 1928 construction of a new vehicular roadway on the upper deck of the Queensboro Bridge was approved by the Board of Estimate at a cost of \$6,000,000. The new roadway will increase the number of traffic lanes from six to nine and the capacity of the bridge, which is approximately 65,000 cars a day, by about 50 per cent. In 1929 the city decided to proceed with the construction of the Triborough Toll Bridge, connecting Queens with the Bronx and Manhattan. See BRIDGES.

Between 1914 and 1920, rapid transit facilities were greatly extended by the addition of a third track for express service to the Second, Third, and Ninth Avenue elevated lines at a cost of \$26,000,000 and by additional construction on the lines operated by the Interborough Rapid Transit Company and the Brooklyn Rapid Transit Company. The latter improvement involved the extension of the Fourth Avenue line of the Interborough up Lexington Avenue to Kingsbridge Road and Bronx Park and of the Broadway line of the B. R. T. downtown from Lexington Avenue and 60th Street to DeKalb Avenue, Brooklyn. The additions totaled about 45 miles of single tracks. Half of the cost of \$330,000,000 was met by the city and half, by the operating companies. In 1919 the Brooklyn Rapid Transit Company went into the hands of a receiver, and in 1923 the Brooklyn-Manhattan Transit Corporation took over control of its properties.

The long-standing deadlock between the State-appointed Transit Commission and the city authorities was partially resolved in 1924 by the Legislature's authorization of the appointment of the Board of Transportation by the Mayor. The board was entrusted with the choice of new subway routes, the construction of new lines and their operation, and the construction of uncompleted portions of the lines already projected. In 1925 construction of 54.79 miles of rapid transit, to supplement the systems of the Interborough and the B. M. T., was undertaken at an estimated cost of \$506,765,000. The lines comprised the Queensboro subway, giving service between Times Square, Manhattan, and Flushing, Long Island; the 14th Street-Eastern subway in Brooklyn; the so-called Nassau Street loop in Manhattan connecting the B. M. T. station under the Municipal Building with the Montague Street tunnel of the B. M. T.; the Washington Heights Line, extending from the upper end of Manhattan along Broadway and St. Nicholas and Eighth Avenues to Fulton Street, with a cross-connection at 53d Street to Long Island City; the Cranberry-Culver line from Church Street, Manhattan, to Cortelou Road, Brooklyn; the Brooklyn Crosstown line from Nott Avenue to Ft. Green Place; the Houston-Jay Street line from Sixth Avenue, Manhattan, to High Street, Brooklyn; the Bronx Concourse line from St. Nicholas Place to Webster Avenue; the Long Island City-Jamaica line from East Avenue to 178th Street; the Schermerhorn-Fulton Street line from Court Street to

NEW YORK

LOWER PART OF NEW YORK FROM GOVERNOR'S ISLAND

Alabama Avenue, Brooklyn; and the Sixth Avenue line from 53d Street to Eighth Street, Manhattan. The Queensboro subway and the 14th Street-Eastern subway were opened in 1928, and by the end of the year the Washington Heights line was largely completed from 212th Street and Broadway south to Church Street at Fulton Street.

In 1929, 37 miles of subways in the boroughs of Manhattan, Bronx, Brooklyn, and Queens were under construction, costing approximately \$305,000,000. These lines included three under-river tunnels: one from lower Manhattan to Brooklyn at Fulton Street, another from 53d Street to Long Island City, and the third under the Harlem River from 155th Street, Manhattan, to 161st Street in the Bronx. In 1927, 40 B.M.T. stations were lengthened at a cost of \$1,106,340, so as to accommodate eight-car trains, thus standardizing the length of all trains in service on this line and increasing the passenger-carrying capacity of each train by 33½ per cent. During the fiscal year ending June 30, 1928, the rapid transit and surface lines of New York carried a total of 2,921,200,000 passengers, an increase of 76,700,000 or 2.7 per cent over the preceding year.

The Holland Tunnel under the Hudson River to Jersey City, which was begun in 1922, was officially opened on Nov. 13, 1927. (See TUNNELS.) In 1929 two additional vehicular tunnels received the indorsement of the city's Board of Estimate. One was to accommodate vehicular traffic across Manhattan under 38th Street and the East River to the Borough of Queens and will have a branch terminating in the Greenpoint section of Brooklyn. The other will cross the Narrows from South Brooklyn to Staten Island. In 1919 the city built a viaduct from Park Avenue across 42d Street overgrade to an elevated roadway passing round the west side of Grand Central Terminal, and in 1929 also around the east side, both passing under the new Grand Central Building and again to Park Avenue. In 1928 a viaduct, carrying Riverside Drive across the valley from 155th to 161st Streets, Manhattan, was completed at a cost of \$2,360,000. In 1929 there was signed between the New York Central Railroad and the City of New York the final contract for the carrying out of the \$175,000,000 West Side improvement plan in Manhattan. The plan called for the elimination of all grade crossings from St. John Park (Beach Street) to Spuyten Duyvil, the removal of tracks from 11th Avenue, and the beautification of Riverside Drive. The reaching of this agreement closed 40 years of negotiation between the railroad and the city over this project. The tracks along Riverside Drive were to be roofed over so as to enable the city to carry out its project of an elevated express highway extending from Canal Street along the West Side waterfront. The New York Central Railroad was to contribute \$110,000,000; the city, \$50,000,000; and the State of New York, \$15,000,000 toward the cost of the improvement which is to be completed by 1936.

In 1917 the city's main water-supply system, the Catskill Aqueduct, was formally opened some 12 years after the beginning of the development of that region. The aqueduct had its origin in the Esopus and Schoharie watersheds with areas of 257 and 314 square miles, respectively. In 1924 construction of Gilboa Dam was completed. This dam, 160 feet high, was used for

impounding the waters of Schoharie Creek in a reservoir of 20,000,000-gallon capacity. The Shandaken Tunnel carried the water a distance of 18 miles to the Ashokan Reservoir, an artificial lake 12 miles long, which was used for impounding purposes; and the Catskill Aqueduct, extending 92 miles from the Ashokan Reservoir to the northern boundary of the city, carried 250,000,000 gallons of water daily to be distributed by 56 miles of tunnel and pipe lines within the city limits. Other reservoirs included in the system are the Kensico storage reservoir near White Plains, the Hillside equalizing reservoir in the city of Yonkers, and the Silver Lake terminal reservoir on Staten Island. In 1929 the construction of a supplementary pressure tunnel, 17 feet in diameter and 20 miles long, was undertaken. The tunnel was to extend from Hill View Reservoir in Yonkers to Hamilton Avenue and Hicks Street in Brooklyn and was expected to be completed in 1932.

In 1916 a zoning plan was adopted by the city to regulate the use to which buildings may be put, their heights in relation to street widths, and the percentage of the area of the lots permitted to be covered. The heights of buildings are regulated chiefly by the width of the street on which they front, with variations for different parts of the city. A tower covering not more than one-fourth of the area of the lot, however, may be carried to any height, setbacks also may be used to increase somewhat the permitted height for the rest of the building. The Russell Sage Foundation in 1922 announced the preparation of a project for an inclusive plan for New York and its environs as far as Bridgeport, Conn., West Point, N. Y., and Princeton, N. J., and including all of Long Island and a large part of the New Jersey coast. The study was completed in 1929 at a cost to the Foundation of approximately \$1,000,000 and covered highway, suburban rapid transit, trunk railroad, waterway, airport, and other needs of New York and its environs for a population of approximately 20,000,000 in 1965.

The opening of the Columbia-Presbyterian Medical Centre on Washington Heights at 168th Street in 1928 marked the completion of the first section of a notable group of combined hospital and medical school buildings designed on skyscraper lines. This great cooperative achievement includes the College of Physicians and Surgeons of Columbia University, the De Lamar Institute of Public Health, the School of Dental and Oral Surgery, the School of Oral Hygiene, the New York State Psychiatric Institute and Hospital, the Presbyterian Hospital of New York, the Presbyterian Hospital School of Nursing, the Squier Urological Clinic, the Harkness Private Pavilion, the Neurological Institute of New York, the Babies' Hospital of New York, the Sloane Hospital for Women, and the Vanderbilt Clinic. In 1929 a site for the proposed Cornell-New York Hospital Medical Centre was secured overlooking the East River between 68th and 70th Streets near the Rockefeller Institute.

Among the notable structures which have been erected since 1918 are the Bush Terminal, American Radiator, Standard Oil, Federal Reserve Bank, S. W. Straus, Farmers Loan & Trust Co., Equitable Life Assurance, Barclay-Vesey (New York Telephone Company), Fred F. French, Salmon Tower, and Graybar buildings; the Commodore, Pennsylvania, Ambassador, Savoy-Plaza, and Sherry-Netherlands hotels; the Guild

Theatre; New York Life Insurance and Chanin buildings; and the Church of the Heavenly Rest (Protestant Episcopal), and Synagogue of the Congregation Emanu-El. In 1929 a \$1,000,000 building was being erected at Fifth Avenue and 103d Street to house the Museum of the City of New York, founded in 1923 and temporarily located in the Gracie Mansion in Carl Schurz Park. Plans called for the construction of a \$15,000,000 Museum of the Peaceful Arts (industrial) and a new \$6,000,000 building for Hunter College, together with the new \$3,500,000 De Witt Clinton High School, on the site of the former Jerome Park Reservoir. Additions to the Metropolitan Museum of Art since 1924 include: the George Gray Barnard collection of Gothic art installed at the Cloisters on Fort Washington Avenue; Wing K, containing collections of Greek and Roman art; and the American Wing. An additional building also was erected by the city for the American Museum of Natural History. There have been important residential and apartment-house developments overlooking the East River at 42d Street, Sutton Place (57th Street), and on East End Avenue around 86th Street.

The city's public-school system, as of Sept. 30, 1928, comprised 710 day and evening schools with a total registration of 1,182,441. Among the high schools erected in 1928 were: Textile High School (\$2,500,000), Evander Childs High School (\$2,533,000), John Adams High School (\$2,500,000), Seward Park High School (\$2,225,000), Samuel J. Tilden High School (\$2,300,000), and Abraham Lincoln High School (\$2,450,000). The school appropriation for 1929 amounted to \$46,150,000 and provided for the construction of 53 new school buildings and additions to 21 existing structures.

In 1929 the New York municipal airport, named in honor of Floyd Bennett, was constructed on Barren Island in Jamaica Bay about 12½ miles east of the Pennsylvania Station at a cost of \$2,500,000. It embraced 387 acres and included all facilities for land and sea planes.

New York is the home of the Federal Reserve Bank of the second district. Bank clearings rose from \$83,018,580,016 in 1914 to \$213,996,182,727 in 1923 and to \$391,627,476,000 in 1928. The value of products manufactured rose from \$2,029,692,576 in 1910 to \$5,259,477,577 in 1919 and to \$5,324,414,000 in 1925. The assessed valuation of taxable real estate in 1929 was approximately \$16,500,000,000; the net debt in 1927 was \$1,394,476,000.

NEW YORK, COLLEGE OF THE CITY OF. A free municipal college at Washington Heights, New York City, established in 1848 by the Board of Education of the city. The student enrollment rose from 7908 in 1914 to 23,761 in the fall of 1928, the faculty from 218 to 650 members, and the annual income from \$084,963 to \$3,540,127.58. The number of volumes in the main library, exclusive of pamphlets, increased from 47,589 to 89,000. In that period, departments were established in engineering and military science, the departments of Greek and Latin were consolidated into the department of classical languages; the department of natural history was divided into the departments of biology and geology, and the department of political science into the departments of economics and government and sociology; and in 1928 a new department of accountancy was formed. A course leading to the degree of bachelor of science in

social science, in addition to the previously existing courses leading to the degrees of bachelor of arts and bachelor of science, was established in 1916. The Brooklyn branch of the evening session was begun in the following year and the entire evening session was opened to women; also in 1917 a summer session was established. In 1919 the first professional schools of technology and business and civic administration, with their own deans and faculties, were founded, and the college was given the name of the College of Liberal Arts and Science. The work of the school of business and civic administration was carried on not only in the Washington Heights buildings and the evening session in Brooklyn, but also at the original site of the college at Twenty-third Street and Lexington Avenue, in a new building on that site costing \$1,500,000 the cornerstone of which was laid in the latter part of 1928. The professional school of education was founded on similar terms in 1921; its work was carried on in the Washington Heights buildings and at various centres in different boroughs in the city. The Brooklyn Center, a day college for men, was opened in September, 1926. The curriculum of the College was revised for new students beginning in 1928. President, Frederick B. Robinson, Ph.D., LL.D.

NEW YORK PHILHARMONIC SOCIETY. See MUSIC, *Orchestras*

NEW YORK STATE COLLEGE FOR TEACHERS. A coeducational State institution for the training of high-school teachers at Albany, N. Y., founded as a State normal school in 1844, and chartered as the State College for Teachers by the Board of Regents in 1905. Courses are offered in liberal arts and sciences, in commercial education, and there is a graduate course in education. The student enrollment was increased from 450 in 1914 to 1200 in 1928-29 and the freshman class limited to 300 each year. The summer session in 1928 had an enrollment of 737. The income from legislative appropriations increased from \$97,000 to \$335,843 in 1928. In 1923 the Legislature appropriated money for the construction of William J. Milne Hall, providing facilities for a practice high school, laboratories, a large lecture hall and recitation rooms; and the alumni pledged \$150,000 for a residence hall. In addition to a special reference library, the college uses the State Library of 1,500,000 volumes. Abram Royer Brubacher became president in 1915.

NEW YORK SYMPHONY ORCHESTRA. See MUSIC, *Orchestras*

NEW YORK UNIVERSITY. A nonsectarian institution in New York City, chartered in 1831. The university increased its enrollment from 5233 in 1914 to 33,692 in 1927-28. The graduate division of business administration was established in 1916; two degrees were then authorized—master of business administration in 1920 and doctor of commercial science in 1923—and the division of oriental commerce and politics was inaugurated. The Ingram Institute for Economic Education and the school of retailing were founded in 1918, and the degree of master of science in retailing was authorized in 1921. In 1920 the name of the school of applied sciences was changed to the college of engineering. A steam engineering plant was built in 1919 and the Sage Engineering Building, for which about \$250,000 worth of equipment was assembled, was authorized in the same year. The engineering research laboratory was built

at University Heights in 1920-21 at a cost of \$345,000. The Nichols Chemistry Building at University Heights, costing \$600,000, was completed in 1927. Evening courses were started in the College in 1921 and in 1923 plans were made for courses in aeronautical engineering.

The medical college was opened to women in 1918. In 1921 the State bacteriological labora-

1928 there were 3,530,811 cattle, 586,704 swine, 27,133,810 sheep, 26,000 goats, and 307,160 horses. Animal husbandry is much the major industry of the country. In 1928 there were produced 9,541,000 bushels of wheat, 862,000 bushels of barley, 3,852,000 bushels of oats, and 4,424,000 bushels of potatoes (1927-28 figures). The following table gives the production of the principal animal products in thousands of pounds.

Product	1912-13	1923-24	1924-25	1925-26	1926-27
Factory butter	64,633	161,603	181,925	173,009	...
Cheese	76,395	171,918	160,893	170,259	...
Wool	202,177	218,369	200,536	223,884	226,032

tory was built at a cost of \$105,000, and the Helen Hartley Jenkins gift of \$150,000 was received. Medical preparatory courses were offered at the Flower Hospital, and medical and dental preparatory courses in the evenings at Washington Irving High School. The school of pedagogy was renamed the school of education and an undergraduate division was established.

The productive endowment increased from \$1,225,227 in 1914 to \$4,290,325 60 in 1928 and the budget from \$592,391 to \$5,569,656.89. During the period, the following buildings were bought or erected: the Trinity Building for the Wall Street division of the school of commerce, a university apartment house, an addition to the chemistry laboratory and a residence house, both at University Heights. Additional space in the Washington Square Building was taken over and other buildings acquired for classroom use. A new building for the school of education was erected early in 1929 at Fourth and Greene Streets, just off Washington Square. In 1928 a bequest of \$500,000 was received from the late Emily O. Butler, and in the same year a gift of \$1,000,000 was received from the Straus family. Chancellor, Elmer Ellsworth Brown, Ph.D., LL.D.

NEW ZEALAND. A British dominion in the southern Pacific, made up principally of North and South Islands, with Steward Island included. Area, 103,862 square miles; population in 1911, exclusive of Maoris, 1,008,468; in 1921, 1,218,913, average annual increase, 2.2 per cent. Estimated population June 30, 1928, 1,389,076, exclusive of 65,004 Maoris. The birth rate in 1927 was 20.29 per 1000 (26.48 in 1912); the death rate, 8.45 (8.87 in 1912); and the marriage rate, 7.90 (8.81 in 1912). In 1926 the excess of immigration over emigration was 11,860 and in 1927, 2428 (in 1912, 8927). Estimated populations of chief towns, with suburbs, on Apr. 1, 1928 (1911 figure in parentheses) Auckland, 206,810 (102,676); Wellington, 130,120 (70,729); Christchurch, 123,370 (80,193); Dunedin, 84,060 (64,237). At the end of 1927 there were 2601 public primary schools with a registration of 223,388, 43 endowed secondary schools with 14,190 pupils; 134 native schools with 6620 pupils; 4 university colleges with 4878 students. The expenditure for public education in 1927-28 was £3,769,969; in 1912-13 it was £1,334,599.

Agriculture. In 1926 there were 1,990,000 acres of arable land in New Zealand, or about 3 per cent of the total area; 16,680,000 acres of permanent meadow and pasture, 163,000 acres of trees, shrubs, and bushes; and about 13,000,000 acres of forest. The total area under cultivation in 1927 was 18,830,436 acres. In

Manufacturing. In recent years, advances in manufacturing have been important. While factories only increased from 4402 in 1910 to 5088 in 1926-27, the number of hands increased from 56,234 to 81,904 and capital from £16,731,359 to £62,723,125. The total value of products in 1926-27 was £83,012,503, of this, meat freezing and preserving accounted for £13,630,714; butter and cheese factories, for £19,021,878. Water-power development is going forward at a rapid pace considering the newness of the country and the small population. More than £6,000,000 had been spent on its development up to 1927. Mining is of relatively little importance, the principal minerals being gold and coal, the value of 1927 production, £534,639 and £2,223,300 (respectively).

Commerce. Imports for 1913, 1920, and 1927 were £22,288,302, £61,595,828, and £44,783,000. Exports for the same years were £22,986,722, £46,441,946, and £48,496,354. Proportions of value by countries of origin of New Zealand's imports for 1913 and 1927 were the United Kingdom, 60 and 48 per cent; other British possessions, 24 and 15 per cent, the United States, 9 and 17 per cent. Proportions for exports were: the United Kingdom, 80 and 76 per cent; other British possessions, 14 and 11 per cent; the United States, 3 and 5.5 per cent. For 1927 imports from the United States were £7,827,755. The most important American products imported are automobiles and machinery. In 1913, 645 vessels of 1,738,985 tons entered, and 635 vessels of 1,699,807 tons cleared. New Zealand ports; in 1927, 634 vessels of 2,195,804 tons entered and 633 vessels of 2,200,763 tons cleared. New Zealand's registered ships employed wholly or partly in the coastal trade totaled 208 of 34,609 tons in 1927, as compared to 404 of 113,341 tons in 1913. New Zealand ships in foreign trade totaled 50 ships of 65,520 tons in 1927 and 29 of 27,015 in 1913.

Communications. In 1928 there were 3180 miles of government-owned railways and only 117 miles of private lines. In 1914 government railways aggregated 2863 miles.

Finance. Total revenues for 1913-14 were £11,961,493; for 1927-28, £25,123,980. Total expenditures for the same years were £11,825,864 and £24,944,905. Estimates for 1928-29 were: revenues, £23,868,250 and expenditures, £23,608,104. The public debt in 1914 was £99,730,427; in 1928, £251,396,252, of which war expenditures (1914-19) accounted for £71,970,636.

History. On July 10, 1912, W. F. Massey, leader of the Reform Party, succeeded the Liberal, Sir Joseph Ward, as Premier. For the next 13 years, his dominant personality ruled

the political destinies of the Dominion. Important administrative reforms were undertaken, aiming at further decentralization in the governmental machinery, as well as reformation of the legislative council. The land question was brought nearer settlement when the law of 1912 allowed settlers on improved land to purchase their holdings. It became evident, therefore, that the state relinquished its early policy of state participation in the benefits of the unearned increment. The extreme state socialism which had been typical of New Zealand history up to 1911 and which was made possible by the union of the Labor elements with the Liberal Party, was terminated as the industrialization of the country proceeded and the stratification into classes became more perceptible. The farmers had become more conservative as bulwarks were erected for the safeguarding of private property; the laboring classes had become more radical with the appearance of a wealthy group in the population. The result was the growth of the Labor Party and the decision of workers not to accept decrees of the Arbitration Court but to try their strength in the strike. Bitter industrial conflicts became frequent, those of 1912 and 1913 being characterized particularly by ill feeling.

The World War momentarily put a stop to all internal questions. Volunteer forces were raised for action in German Samoa, the Government was empowered to fix prices and to suspend the labor laws, rent laws were passed (1916), and in 1915 a coalition cabinet was formed for the more effective prosecution of the War. In 1916 a conscription act was passed, though not without opposition, for, in 1917, the coal miners went on strike to secure total exemption. A total of 124,121 men were enrolled in the army, about 90,000 of them volunteers. War financing was based on loans rather than revenues, although some increases were made in taxation, notably in higher income taxes, stamp duties, customs, railway fares, etc. Beginning with 1916, several loans were floated to an approximate total of £100,000,000. The easy success with which all this was accomplished was due to the prosperity which the Dominion enjoyed throughout the War. Most of New Zealand's exports, meats, cheese, wool, hides, sheepskins, were contracted for by the British government, and though prices were fixed, sales reached enormous proportions. By 1921 more than £160,000,000 in produce was sold in this fashion. In spite of the rise in the cost of living, therefore, no class of society was touched by want. Through the fixing of prices of household necessities by the Board of Trade, the importation of wheat in 1918, when a local shortage impended, and the purchase of sugar abroad, retail prices were kept within reason. By the agency of the Court of Arbitration, wages were reviewed and increased to meet mounting costs.

In 1919 the coalition came to an end with the withdrawal of Sir Joseph Ward from the cabinet. The election which followed indicated the increasingly radical temper of Labor. The syndicalist tinge which industrial agitation had taken on was reflected in the outspoken socialist platform of the Labor Party. The election results, however, showed the conservatism of the average voter. Massey's Reform Party elected 47 members, the Liberals only 20, and Labor 8. Labor troubles continued through 1919 and 1920, and the latter year was marked by a general strike of the railway workers. The world depres-

sion of 1921, which struck the farmers in particular, and the general unemployment were reflected in the political realignments. In the 1922 elections, the Government seats were reduced to 38; Liberals elected 25; Labor, 17. Two questions of importance locally were the status of the repatriated soldiers and the vote on prohibition. Beginning with 1915, pension and settlement acts were put on the statute books, so that by 1921 upward of 35,000 pensions had been granted and more than 7000 soldiers settled on the land. A repatriation department was created for the vocational guidance of ex-service men. By 1922 more than £30,000,000 had been spent in this work of repatriation.

Polls continued to be taken on national prohibition. By the law of 1918, a triennial vote was ordered on three possibilities: prohibition, license, and state control. A majority of the total vote cast was made necessary for passage. The votes in 1919, 1922, and 1925 all gave prohibition a plurality, but never a majority. In 1928 the majority cast against prohibition and in favor of licensing was close to 200,000.

Massey died in office on May 10, 1925, and was temporarily succeeded by Attorney General Sir Francis Bell, who was Premier from May 15 to May 27. Then the Reform Party elected J. G. Coates as its new leader, and he automatically became the new Premier on May 30, 1925. In the elections of Nov. 4, 1925, the Government won 53 seats out of the total of 80 in the Lower House, and so Coates continued in office for the next three years. The verdict, however, was reversed in the elections of Nov. 14, 1928, in which the Reform Party secured only 27 seats, while the United Liberals also got 27 seats and the Labor Party got 19. The remaining seven seats were scattered among various independents. The United Liberal leader, Sir Joseph Ward, then became Premier again, from Dec. 19, 1928. (The 42 members of the Upper Chamber, known as the Legislative Council, were appointed for seven-year terms by the governor general.)

The appointment of Lord Jellicoe in 1920 as Governor General of the Dominion brought the question of national defense to the forefront as an issue of major importance. The idea of an independent New Zealand naval unit came up for serious consideration time and again. At the various imperial conferences after the War, moreover, Premier Massey adopted a position strongly in favor of the Commonwealth arrangement as it was finally stated in the Balfour Report, a year after the New Zealander's death. New Zealand became a member of the League of Nations on Jan. 10, 1920, and on December 17 of the same year, the Dominion was given a mandate over German Samoa, now called Western Samoa. Colonel Stephen Shepherd Allen was appointed Administrator of Western Samoa on Mar. 22, 1928. In 1923 the territorial jurisdiction of New Zealand was extended to include the Ross Dependency, that is, the area within the Ross and Victoria quadrants of the Antarctic Continent. On Dec. 13, 1924, General Sir Charles Fergusson was appointed governor general to succeed Jellicoe. His term was for five years.

In 1929 the Ward government announced a scheme to borrow some \$350,000,000 during the next 10 years for purposes of developing the Dominion in a wide variety of directions.

NEY, ELLY (1882-). A German pianist, born at Dusseldorf. After graduation from the Cologne Conservatory, where her teachers were

I. Seiss and K. Böttcher, she went for further study to Leschetizky and Sauer in Vienna and won both the Ibach and the Mendelssohn prizes. For several years, she taught at the Cologne Conservatory. Her tours of Germany, Austria, Russia, and Scandinavia established her reputation as one of the greatest of contemporary pianists. At her American début (New York, Oct. 15, 1921), she took her audience by storm and immediately became a prime favorite. She later made annual tours of the States. In 1911 she married the Dutch conductor, Willem Van Hoogstraten, from whom she was divorced in 1927. In 1928 she married the American financier, Paul Allais of Chicago.

NICARAGUA, nē'kă-ra'gwā. The largest of the Central American republics, with an area estimated at 51,660 square miles; population (according to census of 1920), 638,119. In 1910 the population was estimated at 600,000; and in 1927 at 650,000. At least 75 per cent of the inhabitants live in the western half of the country. Capital, Managua, with a population in 1926 of 32,536. Other large towns are Leon (38,318), Granada (16,773), Matagalpa (10,271), Masaya, (10,287). Illiteracy among the population is still high. In 1925 there were 460 elementary schools with 24,490 pupils.

Industry and Trade. The agricultural products of the western half are varied, coffee, sugar cane, wheat, cacao, and beans are grown. The average annual crop of coffee is placed at 25,000,000 pounds. In 1921, the export value of coffee was \$2,352,487, and the 1927 exports were worth \$4,082,000. Sugar exports in 1927 were worth only \$443,000. The sugar industry took its inception from the great demand created during the War. Exports of sugar in 1916 totaled only 3034 metric tons; in 1922, this export was 9948 tons, but by 1927 had dropped to 5853 tons. The banana is the principal crop grown in the east. The banana exports in 1927 were 2,386,000 stems, compared with 2,617,765 in 1922. Timber and forest products also play an important part in Nicaragua's foreign trade. Gold exports average \$1,000,000 yearly. Practically all exports of lumber and gold go to the United States. In 1927 imports into Nicaragua were valued at \$10,208,000 (\$5,604,300 in 1913); exports in 1927 \$8,986,000 (\$7,494,100 in 1913). Proportions in 1927 by countries of origin of imports were: the United States, 66.4 per cent (50 in 1912); the United Kingdom, 10 per cent (19 in 1912); France, 3 per cent (5 in 1912); Germany, 6.7 per cent (12 in 1912). Leading imports are cotton goods, chemicals, iron and steel, and wheat flour. Proportions in 1927 by countries of destination of exports were: the United States, 55.6 per cent (46 in 1912); France, 13.1 per cent (16 in 1912); the United Kingdom, 6 per cent (13 in 1912). The isolation of the Atlantic coast, with communications between the west and the east by way of Costa Rica and Panama, led the Government to survey a route from San Miguelito on Lake Nicaragua to Monkey Point on the Atlantic, and in 1921 a loan of \$9,000,000 was secured in New York for this and other purposes. The national railways also passed into the hands of New York bankers for \$2,000,000. In 1920 work was begun on a railway from Chinandega to Playa Grande on the Gulf of Fonseca, as a link in the International Railways chain. Total railway mileage in January, 1929, was 163 miles, exclusive of small private lines. There were 1800 miles of telegraph

wire and 1143 miles of telephone wire in 1926.

Finance. For 1927 revenues were \$3,666,900 (\$2,479,313 in 1914) and expenditures \$3,228,494 (\$1,980,328 in 1914). Total debt on Mar. 31, 1927, \$10,183,000, including claims and floating debts of \$4,000,000. As a result of the ambitious financial scheme of 1917, the size of the debt consistently decreased. By the programme, a rigorous budget was laid out; financing of deferred interest was provided for; the floating debt was settled. Credit so improved that in 1921 a loan of \$9,000,000 was raised, part of which was to be applied toward the redemption of the 1909 bonds. Financial recovery was set back by the revolution of 1926-27, the cost of which was estimated at \$20,039,651. Most of this expense was met by the United States.

History. The continued interest of the United States in Nicaraguan affairs aroused the hostility of other Central American republics, and two of these, Costa Rica and Salvador, were led to sue Nicaragua in the Central American Court of Justice when the Bryan-Chamorro Treaty was finally ratified by both parties in 1916. By this instrument, for the payment of \$3,000,000, the United States acquired exclusive canal rights in Nicaragua, permission to construct a naval base on the gulf of Fonseca, and the Corn Islands. Though the suits were successful, the decision was disregarded by Nicaragua and the United States. The continued stay of American marines in the country insured the permanence of the Government in power. Border outbreaks in 1921 and revolutionary disturbances in 1922, which for a time led to an attack on Chinandega by rebels, and a move on the capital in August, 1922, caused the holding of a conference by the presidents of Nicaragua, Honduras, and Salvador, on board the U.S.S. *Tacoma* in Fonseca Gulf on Aug. 22, 1922. Steps were taken to check revolts fomented by political emigrants and for the putting down of border uprisings by united action. The purpose of the general treaty of peace and friendship signed on Dec. 20, 1907, by all the Central American countries was reaffirmed. This move, fostered by Nicaragua, was in strange disagreement with its refusal to join the Central American Union created in 1921. Nicaragua did, however, participate in the subsequent Central American Conference at Washington and in the treaties signed there. See CENTRAL AMERICAN UNION.

On May 8, 1917, Nicaragua declared war on Germany and as an Associate Power became an original member of the League of Nations. The President for 1916-20 was Emiliano Chamorro; for 1920-24, Dr. Diego Manuel Chamorro. The untimely death of Dr. Chamorro on Oct. 19, 1923, necessitated the ad interim assumption of presidential powers by the Vice President, Bartolomeo Martinez, pending the election of a new President in October, 1924. For this election, a new electoral law, drafted by an American, Dr. H. W. Dodds, secretary of the National Municipal League, had been adopted, and Dr. Dodds was invited to assist in installing the new system. An offer by the Washington government to withdraw the force of American marines which had been stationed in Nicaragua since 1912, unless the Nicaraguan government desired their continued presence to safeguard electoral freedom, elicited the reply that the Nicaraguan government desired the Legation guard to re-

main at least until the installation of a new administration in January, 1925.

In the months preceding the elections in October, there was much disorder, but the elections themselves passed off quietly. Carlos Solorzano was chosen President and Dr. Juan Sacasa, Vice President. They were inaugurated on January 1. On August 3, the United States withdrew the force of marines which had been stationed in Nicaragua since 1912. It was only a few weeks before military outbreaks ensued. Ex-President Chamorro, Conservative leader, through a *coup d'état* made himself military master of the government in October, and Sacasa, the Liberal Vice President, fled. To preserve an appearance of constitutionality in his taking over of the Presidency, Chamorro had himself elected to the Senate, forced the subservient Solorzano to resign, Jan. 15, 1926, and was selected by Congress to fill the office of President, but the United States flatly refused the all-important recognition. Claiming that Sacasa was the constitutional President through the resignation of Solorzano, the Liberals took up arms in May and captured Bluefields, on the east coast. United States marines were landed there, ostensibly to protect American lives and property, and a neutral zone was declared around the city. Although defeated by Chamorro, the Liberals, generously aided, it was said, from Mexico, again became active and American marines, who had been withdrawn in June, were once more landed in August.

Attempts by the United States to reconcile the factions failed. On October 30, Chamorro resigned and on November 11, Congress chose Adolfo Diaz, a Conservative, as his successor. He was immediately recognized by the United States. The Liberals, however, refused to consider him as rightfully chosen, and on December 2, at Puerto Cabezas, declared Dr. Sacasa the constitutional President. He in turn was recognized by Mexico, whose support so strengthened the Liberal cause that Diaz complained that he could not hold out without American aid. On December 23, Admiral Latimer of the United States Navy, on instructions from Washington, took possession of the Liberal capital, Puerto Cabezas, and established a neutral zone there, rendering Liberal operations practically ineffective. Criticism in the United States became sharp, and brought a message from President Coolidge in January charging Mexico with keeping the revolution alive, against American interests, through material support of Sacasa.

Fighting continued sporadically and in April, President Coolidge sent Henry L. Stimson to Nicaragua as a mediator. With the power of the United States behind him, he virtually compelled the Liberal leader, General Moncada, to lay down his arms. The Conservatives also consented to take the same action. On May 5, a programme was laid down which included full disarmament, continued control by American marines until a native constabulary could be trained, an election supervised by Americans, and other provisions. They were accepted by all factions except that led by General Sandino, who defied the American marines and carried on a guerrilla warfare against them in the northern mountains. During most of 1928, sporadic clashes occurred, with a number of losses to the marines and reported heavy casualties to the Sandino forces. In November, at an orderly election supervised by General

Frank R. McCoy, U. S. Army, sent to Nicaragua for this purpose, General Moncada, the Liberal leader, was elected President. Following his inauguration on Jan. 1, 1929, the situation gradually cleared as all factions except the Sandino band accepted the result of the elections. Dr. Sacasa was appointed Minister to Washington in the spring of 1929 and presented his credentials on April 15. Sandino in June went into exile in Mexico and except for occasional brushes between the marines and bandits, peace was fully restored. In June, preparations were made to send to Nicaragua a battalion of engineers to make a survey of the route for a proposed Nicaragua Canal.

NICHOLAS II (1868-1918). Emperor of Russia from 1894 to 1917 (see VOL. XVII). In September, 1915, he took over the nominal command of the Russian Armies. The reactionary influences about him and his fatalistic temper prevented him from making any effective resistance to those intent on his downfall. In March, 1917, when the representatives of the Duma demanded his abdication, he submitted, with very little protest, in favor of Grand Duke Michael. The Grand Duke declined to accept the honor, unless the crown was tendered to him by the will of the people. At first, it was planned to send the Imperial family to England, but the Provisional Government would not allow this, and Nicholas and his wife, son, and four daughters were transferred from Pskov to Tsarskoe Selo and then to Tobolsk, where they remained for several months. In 1918 they were taken to Ekaterinburg, given an apartment of only three rooms, and when Kolchak advanced in the Ural in July, the Communists, at a secret meeting, decided to put the Czar and his family to death. They were all shot in the cellar of the house where they had lived, and their bodies were removed to an isolated spot near Ekaterinburg and burned. A few pieces of their clothing were afterward found at the place.

NICHOLAS (NIKOLAI NIKOLAEVITCH, ny-ê-kô-lay-ê-vêtsch), **GRAND DUKE** (1856-1929). A Russian general (see VOL. XVII). At the outbreak of the World War, he was given command of the Russian Armies, and handling them with admirable skill, successfully overran East Prussia which materially relieved the hard-pressed French and British in the West. The Allies esteemed it a tragedy of first magnitude when his defeats of 1915 and domestic politics induced the Czar to take command in September, 1915. The Grand Duke was sent to the Caucasus as viceroy and commander, and there carried out the successful campaigns of Erzerum and Trebizond. After the revolution, he lived under surveillance in the Crimea until he escaped from Russia on a British warship. He lived for a time in Italy, and then in Choigny, near Paris. Many Russians looked to him as the rightful aspirant to the throne of Russia. He died of pneumonia at Cap d'Antibes on the French Riviera.

NICHOLS, ERNEST FOX (1869-1924). An American physicist (see VOL. XVII). He was professor of physics at Yale University from 1916 to 1920; director of pure science at the Nela Research Laboratories at Cleveland, Ohio, during 1920-21; and president at the Massachusetts Institute of Technology from March to November, 1921, after which he returned to the Nela Research Laboratories.

NICHOLSON, WILLIAM (1872-). An English painter and engraver, born at Newark,

England, and educated at the Magnus School there and at the Julian Academy at Paris. As a student, he produced good experimental work in wood engraving by using bold masses of black and white or of sombre grays and browns relieved by touches of bright color. He engraved many portraits, illustrated books, and collaborated with James Pryde in designing posters under the name of Beggarstaff Brothers. As a painter, he was best known for interior and still life subjects, although he did portraits and landscapes. He received the gold medal in Paris (1900), and is represented in the Luxembourg and in many English galleries. He published *An Alphabet* (1898); *An Almanac of Twelve Sports* (with Rudyard Kipling, 1898); *London Types* (with W. E. Henley, 1898), and *Characters of Romance* (1900).

NICOLLE, CHARLES (1864-). A French physician born in Rouen. He studied at the Pasteur Institute under Metchnikoff and Roux, and was for a time professor of microbiology at the University of Rouen. While a surgeon in the French Army stationed at Algiers he began the scientific study of typhus fever and was able to show by numerous experiments on monkeys and chimpanzees that the body louse was the chief if not the sole transmitting agent. Nicolle remained in Africa as director of the Pasteur Institute, Tunis, and in 1916, in conjunction with Dr. Blaisot, discovered a cure for eruptive typhus. In 1928 he was awarded the Nobel Prize in medicine.

NIDAROS. A city in Norway formerly called Trondhjem. See NORWAY, under HISTORY.

NIEHAUS, CHARLES HENRY (1855-). An American sculptor (see VOL XVII). His later works include the John Paul Jones monument at Washington, D. C., the Commodore Perry monument, Buffalo, N. Y.; statues of Zachariah Chandler and Governor Click, National Capitol; Hernandez Cortez, Panama-Pacific Exposition; Francis Scott Key Memorial, Baltimore (1922), and war memorials at Hoboken and Newark, N. J.

NIELSEN, FRED KENELM (1879-). An American lawyer, born in Denmark, and educated at the University of Nebraska and the law department of Georgetown University. After admission to the bar, he practiced law in Washington and was special agent of the General Loan Office from 1909 to 1911. From 1913 to 1922, he was assistant and acting solicitor to the Department of State, and in 1914, delegate at the conference to conclude the treaty for the government of Spitzbergen. He served during the World War as a major in the United States Army. At the Paris Peace Conference, he was in charge of matters relating to treaties and claims against the enemy governments, and he was American representative in the drawing up of other treaties. He served as technical expert at the Disarmament Conference in 1921-22. He was agent and counsel for the United States in arbitrations with Great Britain, the Netherlands, and Mexico.

NIELSEN, LUDOLF (1876-). A Danish composer, born at Norre-Tvede, Denmark. At the Copenhagen Conservatory, he studied under V. Tofte (violin), A. Orth (piano), and F. Hartmann (composition), and in 1903-04 he attended the Leipzig Conservatory. As winner of the Ancker stipend, he spent the year 1907 in travel and study in Germany, Austria, and Italy. From 1897 to 1907, he was solo violist and assis-

tant conductor of the Tivoli Orchestra and viola of the Björvig Quartet. He later lived in Copenhagen as teacher and composer. He wrote three operas, *Isabella* (Copenhagen, 1915), and *Uhret* and *Lola* (not produced up to 1929); three symphonies; the symphonic poems *Ragnar Lodbrog*, *Sommernatsstemning*, *In Memoriam*, *Fra Bjaergene*, and *Babelstaarnet*; *Romanse* for cello and orchestra; *Hjerstabend*, recitation with orchestra; *St. Hans* for baritone, chorus, and orchestra; two string quartets; and choruses, songs, and piano numbers.

NIGERIA. A British colony and protectorate in West Africa. The colony has an area of 1400 square miles; the protectorate, made up of the northern and southern provinces, has an area of 335,700 square miles. The total population is about 18,765,690, of whom 5200 are Europeans. The leading products of economic importance, measured by exports, are nuts and palm kernels, exports in 1913, £3,109,818; in 1927, £4,438,886; palm oil, exports in 1913, £1,854,384; in 1927, £3,374,550, raw cotton, exports in 1913, £159,223; in 1927 (cotton lint) £331,086; cocoa, exports in 1913, £157,480, in 1927, £1,998,679; tin, exports in 1913, £568,428; in 1926, £2,217,046, groundnuts, exports in 1913, £174,716; in 1927, £1,629,542; hides and skins, exports in 1913, £197,214; in 1927, £651,620. Other products are rubber, mahogany, ivory, live stock, ostrich feathers, and capscums. Exports for 1913, 1920, and 1927 were £7,352,377, £16,987,018, and £16,340,957. Imports for the same years were £7,201,819, £25,216,507, and £15,664,637. Leading imports in 1926 were cotton piece goods and coopers' stores. Tonnage entered and cleared for 1913, 1920, and 1927 was 1,735,036 tons, 1,434,222, and 3,367,312. The importation of spirits was prohibited in 1919 with the result that a customs tax was placed on exports to fill out the territory's revenues. Imports come mostly from the United Kingdom and the British colonies. In 1927, 1470 miles of railway were open. There is a network of excellent motor roads in the southern provinces, as well as several thousand miles of telegraph wire.

The cost of government mounted after the World War. Revenues increased from £3,462,507 in 1913 to £6,304,663 in 1927-28, and expenditures from £2,916,801 to £7,086,775. The debt in 1913 was £8,267,569, in 1927, £23,559,209. The system of administrative centralization inaugurated in 1914 was continued. In 1917 an uprising in the West gave the Government some concern, but it was soon checked. In 1923, to extend more fully the idea of local autonomy, the British government granted the whole of Nigeria a new constitution, embodying a provision for the erection of a legislative council.

NINE-POWER OPEN-DOOR TREATY. See CHINA, History.

NITROGEN, FIXATION OF. See CHEMISTRY, APPLIED; FERTILIZERS.

NITTI, FRANCESCO SAVERIO (1868-). An Italian Liberal leader and Prime Minister, born in Melfi. He was professor of economics in the University of Naples from 1898 to 1904, in the latter year becoming a member of Parliament. From 1911 to 1914, he was Minister of Agriculture; he was a member of the special Italian mission to the United States in 1917, and on his return was appointed Minister of the Treasury. On the fall of the Orlando ministry in June, 1919, he became Prime Minister and held this office until May, 1920. In 1924, when the

Fascists gained full control in Italy, he began the life of an exile, first in Switzerland and after 1926 in Paris. He wrote *Il bilancio dello stato* (1900); *Il capitale straniero in Italia* (1915); and *Bolshevism, Fascism, and Democracy* (trans., 1927).

NIVELLE, né'vél', ROBERT GEORGES (1856-1924). A French soldier, of English ancestry on his mother's side. He entered the artillery service of the army, serving in North Africa (1901-14) and at the outbreak of the World War was a colonel. He greatly distinguished himself in the retreat from Mons and in the Battle of the Marne in September, 1914, and was promoted to be chief assistant to General Pétain in the defense of Verdun. He succeeded to the command in that sector and initiated and carried out a counter-offensive which on Oct. 24, 1916, regained the forts of Douaumont and Vaux. He was appointed successor to General Joffre as commander-in-chief of the French Armies of the North and East on Dec. 12, 1916. He planned and undertook a grand offensive on the Aisne front, but this failed to dislodge the Germans and resulted in immense losses to the French in April and May, 1917; on May 15 he was relieved of his post as commander-in-chief. He was placed in command of the French forces in North Africa (1917-19), was a member of the Higher War Council (1920-21), and in 1920 visited the United States on a special mission.

NOAILLES, nô'ay', COUNTESS MATHIEU DE (1876-). A French poet and novelist (see VOL. XVII), who was known as the "Muse of Gardens" and who received the Grand Prix de la Littérature française in 1921. Her later poetic works include *Les Forces Éternelles* (1920); *Poème de l'amour* (1921); and *L'honneur de Souffrir* (1927). Her later prose was *Poésies et romans*, criticism (1922) and *Les innocents*, short stories showing keen analysis of woman's mind (1923). Consult *La Comtesse Mathieu de Noailles*, by René Gillouin (1908).

NOBILE, UMBERTO (?-) An Italian airman and Arctic explorer. In May, 1920, with Roald Amundsen and Lincoln Ellsworth, he crossed the North Pole from King's Bay, Spitzbergen, to Teller, Alaska, a flight of 71 hours, in the dirigible *Norge*, which he had designed. In May, 1928, in the dirigible *Italia*, he returned to the Arctic to make scientific observations. After a successful flight over Lenin Land (May 15-18), the *Italia* was wrecked on the ice May 25 while on a flight to the Pole. On June 22, the Swedish aviator, Captain Lundborg, landed on the ice floe on which Nobile and some of his crew were stranded, and insisted that Nobile be the first to fly to civilization with him. For allowing himself to be rescued ahead of his crew and for the accident to the airship, Nobile was censured by an Italian Court of Inquiry, which announced its findings on Mar. 3, 1929. He immediately resigned from the flying force, in which he was a general. See POLAR EXPLORATION.

NOGUCHI, no'gōō-chē, HIDEYO (1876-1928). A Japanese physician and scientist whose life was devoted to the discovery and prevention or cure of some of the great disease plagues. (See VOL. XVII). He was connected with the Rockefeller Institute until his death. Diseases specially studied by him were infantile paralysis, syphilis, hydrophobia, verruga peruana, snake poisoning, yellow fever, and trachoma. He developed a diagnostic test for syphilis and con-

tributed materially to knowledge of several diseases. His greatest achievement was considered to be the isolating of the cause of American yellow fever. This was probably premature and his reputed discovery of the cause of trachoma has not been corroborated. It was while engaged in the study of African yellow fever that he contracted the disease himself with fatal outcome. He was one of the greatest of bacteriological technicians and was the recipient of the highest honors from governments and medical colleges and societies. His death, at Accra on May 21, 1928, prevented him from defending his original teachings on the causation of yellow fever, representing years of research in Central America and South America, and also from following up his apparent success with trachoma. His chief writings include *Snake Venoms* (1909); *Diagnosis of Syphilis and Luetin Reaction* (1910, with later editions); and *Laboratory Diagnosis of Syphilis* (1923). His book, *The Etiology of Trachoma*, appeared posthumously in 1928.

NOLEN, JOHN (1869-). An American landscape architect and city planner, born at Philadelphia and educated at Pennsylvania, Munich, and Harvard universities. After 1903 he engaged in practice in Cambridge, Mass. His more important work includes the plans for the Agricultural School and Smith College at Northampton, Mass., for public institutions for Wisconsin, and for many private houses. He drew up plans for the improvement of Roanoke, Va., Sacramento, Calif., and many other cities. During the World War, he was a member of the advisory housing committee of the Emergency Fleet Corporation and was consultant and designer for several towns for the United States Housing Corporation. His many writings on architectural subjects include *Madison, a Model City* (1910); *New Ideals in the Planning of Cities, Towns, and Villages* (1919); and *New Towns for Old* (1927).

NOLHAC, nô'lak', PIERRE DE (1859-). A French historian and critic (see VOL. XVII), who was elected to the French Academy in 1922. In 1920 he was made director of the Jacquemart-André museum in Paris, becoming honorary instead of active curator of the Versailles museum, a position which he had held since 1892. His later works include *Histoire du Château de Versailles* (2 vols., 1911-17); *Le Trion de Marie Antoinette* (1914, trans. 1925); *Vers pour la patrie* (1920); *Ronsard et l'humanisme* (1921); *Souvenirs d'un vieux Romain* (1922); *Versailles et la Cour de France* (1925); *Versailles inconnu* (1925); "La vie amoureuse de Pierre de Ronsard" in the collection *Leurs Amours* (1926); and *Madame de Pompadour et la politique*, a continuation of *Louis XV et Madame de Pompadour* (1928).

NORDAU, nôr'dou, MAX SIMON (1849-1923). Pseudonym of Sudfeld, a Jewish author of Hungarian birth (see VOL. XVII), who died in Paris. His later publications include *Menschen und Menschliches von Heute* (1915); *Französische Staatsmänner* (1916); *Morals and the Evolution of Man*, a translation of *Biologie der Ethik* (1922); volumes of Spanish impressions and art and *Zionistische Schriften* (1923). Consult *Figures juives*, by Robert de Launay (1921).

NORDEN, N. LINDSAY (1887-). An American organist and composer, born in Philadelphia. He received his musical training in New York under M. Spicker, F. W. Robinson,

A. Weld, and later, at Columbia University, under Prof. C. Rybner. In 1917 he was appointed W. W. Gilchrist's successor as conductor of the Mendelssohn Club in Philadelphia, where he settled permanently the following year as organist and choirmaster at the Presbyterian Church, choirmaster at St. Paul's, and teacher at the Delancey School. In 1920 he became conductor of the Reading Choral Society, producing oratorios and choral works in the larger forms, and retaining the conductorship after he founded, in 1928 in Philadelphia, the Brahms Chorus, a similar organization. In 1925 he became professor of theory at the Curtis Institute, and in 1927 organist of the First Presbyterian Church. Having become interested in the a cappella music of the Russian liturgy, of which he made a special study, he organized in 1912 the Æolian Choir of 60 trained voices, which he conducted until 1917, introducing to concert audiences works never heard in the United States outside the regular service in some of the larger Russian churches. This pioneer work he continued in Philadelphia with his choir of the Second Presbyterian Church. He edited a large collection of this music, about 80 numbers, with English translation. His original compositions include an overture, *King Melville*; three orchestral sketches, *Silver Plume*, *A Garden*, and *The White Swan*; a cantata, *Thanatopsis*; many motets, anthems, and services; and songs.

NORDENSKIÖLD, nör'en-shëld, NILS ERLAND HERBERT, BARON (1877-) A Swedish anthropologist (see VOL. XVII), a professor at Gothenburg since 1914. In 1927 he made a trip to Panama and Colombia. He also served as neutral president of the Turco-Rumanian mixed Arbitral Tribunal. His later works include *Forskningar och Avenyr i Sydamerika* (1915); *Dromsagor från Anderna* (1916), and *Comparative Ethnographical Studies*, dealing with the South American Indians (6 vols., 1919-25).

NORDENSKJÖLD, (NILS) OTTO (GUSTAV) (1869-1928). A Swedish scientist and explorer (see VOL. XVII). He led a scientific expedition to South America and Patagonia in 1920. His later works include *Kolonisationen och naturfolken* (1914); *Polarnaturen* (1918); *Die nordatlantischen polarsnön* (1921); *Nord- und Sudpolarländer* (1926); *Südamerika, ein Zukunftsland der Menschheit* (1927); and, with Ludwig Mecking, *The Geography of the Polar Regions* (1928).

NORDEN SOCIETY. See NORWAY, HISTORY.

NORDIC. See EUGENICS, RACE PROBLEMS.

NOREEN, nô-rün', ADOLF GOTTHARD (1854-1925). A Swedish philologist (see Vol. XVII). In 1919 he resigned his chair of Scandinavian languages at Upsala University, and in the same year became a member of the Swedish Academy. His later works include *Nordiska ortnamn* (1914); an edition of Marcus Borgström's *Svenska Språkets Historia för folkskoleseminariet* (1916); the sixth and final volume of *Vårt språk* (1903-1918), and *Ynglingatal*, translations of Norse poetry with a commentary (1925).

NORFOLK. A port of entry for Virginia and the third port on the Atlantic Coast in volume of exports. The population increased from 67,452 in 1910 to 115,777 in 1920 and to 184,200 in 1928 by estimate of the U. S. Bureau of the Census. In 1918 the commissioner-manager form of government was adopted, and city plan-

ning and zoning were established. During the World War, the Federal government built an army base terminal at a cost of \$29,000,000, which was afterward leased and operated by the city. A new \$5,000,000 water system, adequate for a city of 1,000,000 population, was procured; two junior high schools and an industrial high school for Negroes were built at a cost of \$500,000 apiece; and 15 playgrounds were established and equipped. Additions to the school buildings since 1924 have totaled \$503,219. A municipal grain elevator and terminal of eight warehouses were built in 1923 at a cost of \$5,000,000 and a municipal market was completed in the same year. Private building operations in 1928 amounted to nearly \$5,000,000 and the city budget, to \$7,321,950.

The total annual value of port commerce increased more than 800 per cent in 10 years, the total foreign cargo movement in 1927 amounting to 6,885,750 tons of which 6,417,266 tons were exports. During 1927 the city's industrial development took on fresh impetus, more than \$8,000,000 being invested in 39 new manufacturing enterprises. Bank clearings in 1928 amounted to \$274,435,000. The assessed valuation of property in 1928 was \$32,896,198; the net debt was \$32,896,198.

NORFOLK ISLAND. See PACIFIC OCEAN ISLANDS.

NORMAL COLLEGE OF THE CITY OF NEW YORK. See HUNTER COLLEGE

NORMAN, Rt. Hon. MONTAGU COLLET (1871-). A British banker, Governor of the Bank of England, a member of the Privy Council (1923), and a lieutenant of the City of London. He was educated from Eton and King's College, Cambridge, was in the Fourth Battalion of the Bedfordshire Regiment, and served in South Africa during the Boer War (1900-01), being made a Companion of the Distinguished Service Order in the latter year. In 1920 he was elected Governor of the Bank of England, traditionally a one-year term, and was subsequently reelected annually for nine consecutive terms.

NORRIS, GEORGE WILLIAM (1861-) An American legislator (see Vol. XVII). He was reelected to the United States Senate in 1918 and 1924. He was one of the most prominent leaders of the so-called Progressive wing of the Republican Party in the Senate. In 1924 he supported La Follette for President and in 1928, Alfred E. Smith.

NORRIS, JAMES FLACK (1871-). An American chemist, born at Baltimore, Md., and educated at Johns Hopkins University. He was with the chemical department of the Massachusetts Institute of Technology (1895-1904), and was professor of chemistry at Simmons College (1904-15) and at Vanderbilt University (1915-16). He returned to the Institute of Technology and in 1916 became professor of organic chemistry there. His original investigations have been chiefly in organic chemistry. He was an associate on the Naval Consulting Board in 1916 and during 1917-18 was connected with the gas-defense work of the Bureau of Mines. He served later in the Chemical Warfare Service, with the rank of lieutenant colonel, and inspected the war gas factories of Germany. He was chairman of the division of chemistry of the National Research Council, 1924-25. Dr. Norris is the author of *The Principles of Organic Chemistry*; *Experimental Organic Chemistry*; and *Textbook of Inorganic Chemistry*.

NORRIS, KATHLEEN (THOMPSON) (1880–). An American novelist (see VOL. XVII). Among her later books are *The Treasure* (1915); *The Story of Julia Page* (1915); *The Heart of Rachel* (1916); *Undertow* (1917); *Marine, the Unconquered* (1917); *Josslyn's Wife* (1918); *Sisters* (1919); *Harriet and the Paper* (1920); *The Beloved Woman* (1921); *Lucretia Lombard* (1922); *Certain People of Importance* (1922); *Butterfly* (1923); *The Callahans and the Murphys* (1924); *Noon* (1925); *Little Ships* (1925); *The Black Flemings* (1926); *Hildegard* (1926); *The Sea Gull* (1927); *Barberry Bush* (1927); *The Fun of Being a Mother* (1927); *The Foolish Virgin* (1928); and *Red Silence* (1929).

NORTH CAROLINA. The twenty-seventh State in size (52,426 square miles) and the fourteenth in population; capital, Raleigh. The population increased from 2,206,287 to 2,559,123, or by 16 per cent; estimated population, 1928, 2,938,000. The white population increased from 1,500,511 (1910) to 1,783,779 (1920); Negro, from 697,843 to 763,407; native white, from 1,494,569 to 1,776,680; foreign-born, from 5942 to 7099. Both urban and rural populations increased during the decade: the former from 318,474 to 490,370; the latter from 1,887,813 to 2,068,753. The growth of the principal cities was Winston-Salem, 22,700 (1910), to 48,395 (1920); Charlotte, 34,014 to 46,338; Wilmington, 25,748 to 33,372; Asheville, 18,762 to 28,504.

Agriculture. As North Carolina is one of the cotton-producing States, it has suffered from the depredations of the boll weevil, which reached the State about 1920–21. Its ravages have varied with the mildness of the winter (the cold killing this pest), so that while there was serious destruction in some sections, the effect on production was not so marked as it was farther South. The acreage planted to cotton in 1913 was 1,576,000 and the production, 792,000, bales; 1920, 1,587,000 and 925,000, 1922, 1,626,000 and 852,000; 1928 (estimated), 1,890,000, and 840,000. See COTTON; also BOLL WEEVIL.

The number of farms increased 5 per cent, or from 269,763 in 1920 to 283,482 in 1925. The acreage of land in farms, however, showed a decrease of 7.1 per cent, or from 20,021,736 in 1920 to 18,593,670 in 1925. The improved land in farms totaled 8,198,409 acres in 1925. The total value of farm property rose from \$537,716,210 in 1910 to \$1,250,166,995 in 1920, or by 132.5 per cent, but declined to \$1,050,015,835 in 1925, the average value per farm was \$2119 in 1910, \$4634 in 1920, and \$3704 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 134,805 were operated by owners; 423, by managers; and 128,254, by tenants. The corresponding figures for 1910 were 145,320; 1118; and 107,287. White farmers numbered 193,473 in 1920, 202,516 in 1925, colored farmers, almost entirely Negroes, numbered 76,290 in 1920 and 80,966 in 1925. Farms reported as under mortgage, 24,499 in 1920, numbered 29,918 in 1925. The total number of cattle was 644,779 in 1920; 538,780 in 1925; dairy cows numbered 462,077 in 1920; 252,387 in 1925; sheep numbered 90,556 in 1920; 66,557 in 1925; swine, 1,271,270 in 1920; 871,187 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 42,642,000 bushels; wheat, 5,150,000, oats, 4,202,000, potatoes, 10,545,000;

sweet potatoes, 7,840,000, tobacco, 475,230,000 pounds; hay, 794,000 tons. Comparative figures for 1913 are corn, 55,282,000 bushels; wheat, 7,078,000; oats, 4,485,000; potatoes, 2,400,000; tobacco, 167,500,000 pounds.

Manufactures. While North Carolina has but recently become a leading manufacturing State, it has great industrial importance. In 1920, there were 14 cities of more than 10,000 inhabitants, which formed 12.1 per cent of the total population; and in 1919 these reported 42.2 per cent of the value of the State's manufactured products. There were in the State 4931 manufacturing establishments in 1909; 5999 in 1919; 2614 in 1925; and 2984 in 1927. Persons engaged in manufactories numbered 133,453, 175,423, and 182,234, respectively; capital invested was \$217,185,588 (1909) and \$660,144,096 (1919). The value of the product was \$216,656,055 in 1909; \$943,807,949 in 1919, \$1,050,434,117 in 1925; and \$1,154,646,612 in 1927. The large increase in value of products in 1919 was mainly due to changes in industrial conditions brought about by the War and cannot be used to measure the normal growth of manufactures during the census period, 1914–19, but the increase in the number of persons engaged in manufacture clearly indicates steady growth in the manufacturing importance of the State. The manufacture of cotton vies with tobacco in value of product cotton manufactures were \$72,680,000 in 1909; \$318,368,000 in 1919; \$316,069,000 in 1925. Lumber and timber products, third in value, amounted to \$33,525,000 in 1909; \$69,580,000 in 1919; and \$38,080,932 in 1925. The manufacture of cottonseed oil and cake, next in order, had a product valued at \$8,504,000 in 1909; \$46,995,000 in 1919; and \$17,484,244 in 1925. The chief manufacturing cities of the State are Winston-Salem, Durham, and Charlotte. In Winston-Salem, there were 66 manufacturing establishments in 1909, with a product valued at \$18,240,000; 73 in 1914, with \$37,288,000; and 93 in 1919, with \$200,485,000. Durham had 60 manufacturing establishments in 1909, with a product valued at \$23,027,000; 74 in 1919, with \$70,659,000, and 54 in 1925, with \$67,532,339. Similar figures for Charlotte were 108 in 1909, with \$10,460,000, 111 in 1919, with \$43,096,000; and 109 in 1925, with \$19,937,497. Other important manufacturing cities are Greensboro, Raleigh, New Bern, Wilmington, and Asheville.

Education. The educational problems in North Carolina in the immediate past have been those of the other Southern States that have a large colored population. Schools were re-organized in 1919 and provision was made for the State Equalizing Fund, the purpose of which is to distribute as equally as possible the burden of supporting the county schools, the General Assembly had been setting apart a fund for this purpose for several years. The General Assembly of 1921 inaugurated a greatly improved tax system, which renders easier the raising of money for educational purposes. There was being developed in the State a system of public schools with the county as the unit of administration, in contrast to a tendency in former years for the county to break up into small districts chartered by the General Assembly and made independent of the county authorities. The decision of the courts and legislative acts during this period tended to make the county the unit and to bring all the small local tax or special

charter districts under county control, giving to the county board of education very broad powers. The growth of the community high school was remarkable, the county districts providing as good high-school advantages as the towns and cities. Vocational training in agriculture and home economics was carried on in the public schools, having been made possible through acceptance of the provision of the Federal act that appropriates Federal funds to the States for this purpose. The Legislature of 1921 created a Division of Negro Education, to which was entrusted the general supervision of Negro schools in the State, with the design of its effecting improvements in these schools. The school enrollment increased from 520,404 in 1910 to 818,739 in 1925-26; that in high schools alone, from 14,407 to 84,569. Expenditure for public day schools in 1925-26 was: current, \$26,278,446; outlays, \$8,413,223. The percentage of illiteracy in the State decreased from 22.6 in 1910 to 16.9 in 1920; among the native white population from 15 to 10.7; among the foreign-born, from 8.1 to 7; among the Negro, from 24.2 to 18.9.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$18,142,100 (of which \$2,074,306 was aid to local education); for conducting public-service enterprises, \$9,952; for interest on debt, \$6,125,268; for permanent improvements, \$22,501,890; total, \$46,779,210 (of which \$24,534,293 was for highways, \$4,206,686 being for maintenance and \$20,327,607 for construction). Revenues were \$35,826,832. Of this, special taxes formed 21.5 per cent (there being no general property tax); departmental earnings and charges for State officials' services formed 11.9 per cent; sales of licenses and taxation of gasoline, 50.1 per cent. Net funded State debt, notably increased in the course of the year, stood on June 30, 1927, at \$147,981,294. Highway bonds outstanding totaled \$94,999,600.

Political and Other Events. North Carolina, up to the political reversal of 1928, remained steadily Democratic. In 1914 Senator Overman was reelected. Democratic Representatives were elected to all districts except one. In 1916 Thomas W. Bickett was elected governor. Wilson received 168,383 votes for President, Hughes, 120,890. In 1918 Senator Simmons was reelected. Cameron Morrison, Democrat, was elected governor in 1920, and Lee S. Overman was reelected to the Senate. Cox received 305,447 votes for President, Harding, 232,848. The State made heavy expenditures for improvements and incurred a large bonded debt. In 1924 A. W. McLean was elected governor, the vote for President was: Davis, 284,270; Coolidge, 191,753. Personal opposition to A. E. Smith for President in 1928 threw the State into the Republican presidential column; the vote was: Hoover, 348,923; Smith, 286,227. But the Democrats elected O. M. Gardner governor, with the whole State ticket.

Legislation. Measures regulating the sale of liquor in the State were enacted in 1915. In 1917 the Legislature amended the laws relating to criminal procedure, created a budget system, and provided for the voting of citizens absent in the national service. In 1919 it enacted measures forbidding child labor and passed an act requiring compulsory school attendance for

children under 14 years of age. In 1921 the banking institutions of the State were regulated. Laws relating to attempted bribery were amended and measures were passed for the promotion of cooperative marketing of farm products. A provision also was made for a State system of roads. The Legislature also made provision for the issue of bonds to enlarge and improve the educational and charitable institutions of the State. In 1923 a measure was passed by the Legislature creating a board to supervise the taxes. A prohibition law was repealed and a law substituted providing prohibition against the transportation, manufacture, or sale of liquors containing more than 05 per cent alcohol. A system of mothers' pensions also was created. In 1925 the State prison system was put under board control, and convict road work was regulated; a permanent board to study the judicial system was created; and a budget system was enacted. A \$2,000,000 bond issue to defray land purchases for Smoky Mountain National Park was authorized in 1927, and the State's presidential primary law was repealed.

NORTH CAROLINA, UNIVERSITY OF. A State institution for men, at Chapel Hill, N. C.; founded in 1795. The University expanded considerably between 1914 and 1928-29, the enrollment increasing from 981 in the former year to 2504 regular students, and 3514 in the extension course, in the autumn of 1928, with an additional registration of 2019 in the summer session of that year; the faculty was increased from 85 to 215; the library from 75,000 to 200,000 volumes, the productive funds in 1928 amounted to \$2,232,575, and the income increased from \$170,000 to \$1,254,400, of which \$75,000 comes annually from the bequest of Mrs. Robert W. Bingham, received in 1917, and \$40,000 from the gift of the General Education Board in 1920. Four new dormitories and three class buildings were erected between 1921 and 1923, and State funds were appropriated in 1923-25 for four other dormitories and a building for the department of chemistry. The Student Union was erected in 1923 from Alumni subscription, and the Alumni Club from a private gift, and in 1926 a gift of \$275,000 was received from William R. Kenan, Jr., for the construction of the Kenan Memorial Stadium. The University extension division publishes an extensive list of bulletins on a number of subjects. Harry Woodburn Chase, Ph.D., LL.D., succeeded Edward K. Graham, who died in 1918, as president.

NORTH CENTRAL, formerly NORTH-WESTERN COLLEGE. An institution of higher education for men and women at Naperville, Ill., founded in 1861, supported by the Evangelical Church, but nonsectarian in its requirements. The student enrollment and the faculty increased from 291 students and 29 instructors in 1916, to 597 students and 41 instructors in the autumn of 1928. The library was increased from 12,500 volumes to 15,000 volumes in the same period. The productive funds of the College amounted to \$723,000 in 1928 and the income for the year was \$137,600. In 1921 an addition of \$500,000 was received for the endowment, and \$250,000 for building purposes, from the Forward Movement Campaign of the Evangelical Association, and in 1923 the campus was increased by 41 acres through other gifts. In the following year, \$90,000 was received in gifts, including \$9000 for the athletic field and \$8000 for the Home Economics Practice House, and an

auditorium to cost \$200,000 was under construction. Gifts in 1925 included \$25,000 for a memorial organ, and \$55,000 from the citizens of Naperville toward the Barbara Pfeiffer Memorial Hall; a new chapel-music building was also under construction at a cost of \$225,000. Improvements in 1927 included the erection of a women's dormitory, Kaufman Hall, the gift of Mr. and Mrs. Jacob Kaufman, of Kitchener, Ontario, and of Mr. and Mrs. Henry Pfeiffer, of New York. The name of the College was changed from Northwestern College to its present name in 1926, to avoid confusion with other institutions of the same name, and four-year courses leading to degrees were established in the school of music. President, Edward Everett Rall, Ph.D.

NORTHCLIFFE, ALFRED CHARLES WILLIAM HARMSWORTH, FIRST VISCOUNT (1865-1922). A British newspaper publisher (see VOL. XVII). His activities in influencing public policies at the outbreak and during the course of the World War were in many cases highly effective. He was strongly opposed to the administration of Lord Kitchener as Secretary of State for War and was instrumental in making Lloyd George Minister of Munitions, a new post in the War Office. He was an ardent supporter of Lloyd George and had much to do with the latter's accession to the premiership. In 1917 he was appointed director of the Civil Aerial Transport Committee and chairman of the British War Mission to the United States; in the following year, he was director of propaganda in the enemy countries. For his services during the War, he was created viscount in 1917. He published *At the War* (1916); *Newspapers and their Millionaires, with Some Further Meditations About Us* (1922); and *My Journey Round the World*, edited by Cecil and St. John Harmsworth (1923). Consult *Lord Northcliffe: a Memoir*, by Max Pemberton (1922), and *Lord Northcliffe; a Study* by R. Macnair Wilson (1927).

NORTH DAKOTA. The sixteenth State in size (70,837 square miles) and the thirty-sixth in population; capital, Bismarck. The population increased from 577,056 in 1910 to 646,872 in 1920, a gain of 12.1 per cent; population, 1925 (State census), 641,192. The white population increased from 569,855 (1910) to 639,954 (1920), the native white, from 413,697 to 508,451. Indians decreased in number from 6486 to 6254, Negroes, from 617 to 467; foreign-born whites, from 156,158 to 131,503. Urban population mounted from 63,236 to 88,239; rural, from 513,820 to 558,633. The growth of the principal cities was as follows: Fargo, 14,331 (1910), to 21,961 (1920); Grand Forks, 12,478 to 14,010; Minot, 6188 to 10,476.

Agriculture. As North Dakota is one of the largest grain-producing States, agricultural conditions have been much affected by the fluctuations in price and production of wheat and other grains during and since the War. Accounts of the general agricultural situation will be found under AGRICULTURE, CORN, and WHEAT. The number of farms, which had increased 4.5 per cent in the previous decade, declined from 77,690 in 1920 to 75,970 in 1925; the total acreage in farms from 36,214,751 to 34,327,410, or by 5.2 per cent. The improved land in farms totaled 24,563,178 in 1920. The percentage of the total area used for agricultural purposes increased from 63.3 in 1910 to 80.6 in 1920, but decreased to 76.4 in 1925. The total value of farm property rose from \$974,814,205 in 1910

to \$1,759,742,995 in 1920, or 80.5 per cent, but receded to \$1,191,036,966 in 1925; the average value per farm was \$13,109 in 1910, \$22,651 in 1920, and \$15,678 in 1925. In interpreting these values, the currency inflation incident to the World War is to be taken into consideration. Of the total number of farms in 1925, 49,513 were operated by owners; 361, by managers; and 26,096, by tenants. The comparative figures for 1910 were 63,212; 484; and 10,664. White farmers in 1920 numbered 77,147, of whom 40,899 were native and 36,248 foreign-born. In 1910, there were 73,617 white farmers; 35,750 native, and 37,867 foreign-born. In 1920, the colored farmers numbered 543, of whom 517 were Indians; in 1910 there were 743, of whom 721 were Indians. Farms reported as under mortgage, 40,462 in 1920, at the time of the unfavorable agricultural conditions after the War, diminished to 31,602 in 1925. The number of dairy cows was 461,093 in 1920; 312,045 in 1925. The number of "beef" cows was 296,135 in 1920; 328,427 in 1925. The number of sheep increased from 298,912 in 1920 to 310,527. The estimated production of the principal farm crops in 1928 was as follows: Corn, 24,426,000 bushels; wheat, 142,923,000; oats, 59,954,000; rye, 12,710,000; barley, 55,654,000; flaxseed, 8,115,000; and hay, 3,346,000 tons. Comparative figures for 1913 are corn, 10,800,000 bushels; wheat, 78,855,000; oats, 57,825,000; rye, 1,800,000; barley, 25,000,000; potatoes, 5,100,000; and hay, 388,000 tons.

Manufactures. There were three cities in 1920 having more than 10,000 inhabitants. These formed 7.2 per cent of the total population in 1920 and reported 33.3 per cent of the value of the State's manufactured products in 1919. There were 752 manufacturing establishments in the State in 1909; 894 in 1919; 320 in 1925; and 307 in 1927. Wage earners in manufacturing numbered 4472 in 1919; 3261 in 1925; and 3260 in 1927. Capital invested amounted to \$11,584,747 in 1909 and \$24,548,833 in 1919. The value of the manufactured products amounted to \$19,137,506 in 1909; \$57,373,622 in 1919; \$44,631,516 in 1925; and \$47,003,022 in 1927. The increase in the value of products was due partly to price changes incident to the War. The most important industry in the State in point of value of product is gristmilling. This amounted to \$11,685,000 in 1909; \$29,282,000 in 1919; \$16,052,922 in 1925. The manufacture of butter ranks second, its product bring valued at \$1,029,000 in 1909; \$1,740,000 in 1914; and \$11,122,000 in 1919. Dairy products in 1925 totaled \$14,786,842. Printing and publishing had a product valued at \$1,910,000 in 1909; \$2,220,000 in 1914; and \$3,225,000 in 1919. Car construction and repair had a product valued at \$680,000 in 1909; \$1,235,000 in 1914; and \$3,183,000 in 1919. The principal manufacturing cities are Fargo, Grand Forks, and Minot.

Education. During recent years, there was a rapid increase in the number of standardized rural schools and in the consolidated schools of the State. Two normal schools were established at Minot and Dickinson, respectively, and the normal school at Valley City became the State Teachers College, granting a bachelor's degree. For a number of years, a campaign against illiteracy has been carried on. The legislative session of 1923 granted an appropriation for Americanization work which made it possible

for the department to appoint a State director for adult education. The State then entered upon what was regarded as a period of reconstruction in education, and a new State educational programme was undertaken. The total enrollment in the public schools increased from 139,802 in 1910 to 172,818 in 1925-26; of this number, 149,565 were enrolled in elementary, and 23,253 in secondary grades. Expenditure for public day schools in 1925-26 was current, \$12,902,933; outlays, \$1,359,235. The percentage of illiteracy in the State decreased from 37 per cent in 1910 to 2.9 per cent in 1920; among the native white population, from 0.4 to 0.3; among the foreign-born white, from 5 to 4.9; and among the Negro, from 6.8 to 6.7.

Finance. State expenditure in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, was: for maintenance and operation of governmental departments, \$8,427,548 (of which \$1,490,788 was aid to local education); for conducting public-service enterprises, \$5,235,518 (spent chiefly in mill and elevator operations); for interest on debt, \$1,632,457; for permanent improvements, \$3,792,278; total, \$19,087,801 (of which \$4,393,811 was for highways, \$681,371 being for maintenance and \$3,702,440 for construction). Revenues were \$19,428,280. Of this, property and special taxes formed 23.3 per cent, departmental earnings and charges for officials' services, 7.5 per cent; sales of licenses and taxation on gasoline, 13.7 per cent. Property valuation was \$998,180,492, State taxation thereon, \$3,842,995. Net State funded debt on June 30, 1927, was \$4,519,097.

Political and Other Events. One of the foremost political developments in the State in recent years was the rise of the Nonpartisan League to a position of control, with resultant Socialistic tendencies in government. In 1914 L. B. Hanna, Republican, was elected governor and A. J. Gronna was reelected senator. The Nonpartisan League, an organization composed chiefly of farmers, and founded largely through the efforts of A. C. Townley, had, by 1916, gained political predominance. The success of the League was facilitated by a breach in the Republican Party in the State. The League advocated the ownership by farmers of terminal elevators, banks, and other facilities for marketing their crops. The State-wide primaries in June, 1916, indorsed candidates of this party, and the State Republican organization came under its control. The League elected its entire State ticket, including L. J. Frazier for governor. It supported Porter J. MacCumber for reelection to the United States Senate. For President, Wilson received 55,260 votes, and Hughes, 53,471. The League, once in control of the State government, initiated State ownership of terminal grain elevators, packing plants, banks, and other organizations. In 1918 Governor Frazier was reelected, together with the other State officers. At a referendum election held in 1919, the legislative programme of the Nonpartisan League (see *Legislation* below) was adopted. In 1919 A. C. Townley, president of the League, was found guilty under the State Sedition Law. The Nonpartisan League nonetheless continued in political power by the reelection, in 1920, of Governor Frazier. The Republican-Nonpartisan candidate for the Senate, E. F. Ladd, was elected, defeating Senator Gronna. Under the strain of the programme of the Nonpartisan League during this year, the fi-

nancial system of the State became severely embarrassed. The League had established a State bank in which it was designed to compel the deposit of all public funds. This bank was to be the source of credit for carrying out State projects, and at one time it contained over \$30,000,000 in deposits. The people voted against the compulsory deposit of funds in the bank and as a result there were withdrawn large amounts until the deposits amounted, in 1920, to only about \$10,000,000. In spite of the action of the State Industrial Commission forbidding counties and towns to withdraw funds, the situation became extremely embarrassing and the programme of the League was largely discontinued. A plan to finance industries by the issue of bonds amounting to \$17,000,000 failed. In 1920 Harding, for President, received 160,072 votes, and Cox, 37,422. Industrial and financial conditions continued to be bad in 1921. The government system of North Dakota provides for the recall of public officials, by popular vote. Governor Frazier, the attorney general, and the commissioner of agriculture and labor were recalled. R. A. Nestos succeeded as governor. This action was a serious reverse to the Nonpartisan League. In the election of 1922, Governor Nestos was reelected. Frazier, however, was elected to the Senate. The Nonpartisan League also elected a State Auditor and other State officials. At the election of November, 1922, the people adopted a soldiers'-bonus measure. This was declared unconstitutional by the State court on Feb. 10, 1923. A. S. Sorlie was elected governor in 1924 on the Republican ticket, the vote for President was Coolidge, 94,931, LaFollette, 89,922, Davis, 13,858. Under Sorlie, the attempt was made to render the State's business enterprises self-supporting, without embarking on new ventures. Sorlie was reelected in 1926. A referendum in 1928 sustained State prohibition by a slight majority. The State mill and elevator at Grand Forks was reported early in 1928 to be \$1,463,208 behind and still running at a deficit. It was proposed in 1928 to redeem by State bonds some \$25,000,000 lost in bank failures incident to the difficulties of the State bank system. For President, Hoover received 131,441 votes in 1928; Smith, 106,648. George F. Shater, Republican, was elected governor.

Legislation. In 1915 the Legislature abolished capital punishment. In 1917 the Nonpartisan League was in control of the Legislature and a great mass of legislation was introduced along lines advocated by that body. The judicial system of the State was amended. The Torrens system of registration of land titles was put into effect. A constitutional amendment was proposed creating a hail-insurance fund for the protection of farmers' crops. A special session of the Legislature was held in 1918. This authorized the county to issue bonds and loan money to farmers on their personal notes. At this session, the Federal Prohibition Amendment was ratified. The Legislature of 1919 created an industrial commission and authorized it "to conduct and manage, on behalf of the State, certain utilities, industries, enterprises, and business projects." This commission was composed of the governor, attorney-general, and other State officers. The State bank and banking system were also adopted and an issue of \$20,000,000 in bonds authorized for the establishment of the system. The Legislature also

adopted an inheritance and income tax and created the State Board of Administration. Most of these measures were ratified by the people on June 22, 1919. The Legislature of 1919 also adopted an amendment authorizing the State to engage in any industry not specifically prohibited. In 1923 the Legislature passed measures prohibiting expenditures of excessive appropriations, regulating the use of liquor, and forbidding the wearing of masks. Cities were put under the budget system in 1925. A bill to admit private companies into the compensation insurance field, a State monopoly, was vetoed in 1927.

NORTH DAKOTA, UNIVERSITY OF. A State institution for the higher education of men and women at University Station, Grand Forks, N. Dak., founded in 1883. The student enrollment increased from 740 in 1914 to 1650 in the autumn of 1928, and registration in the summer sessions of 1923 and 1928 was 445 and 348 students, respectively. The faculty was increased during the period 1914 to 1928 from 80 to 139 members, and the library from 55,000 to 95,215 volumes. Productive funds in 1928 totaled \$1,700,000 and the income for the year to \$857,000, exclusive of boarding department and trust funds. A chemistry building and an armory were completed in 1919 and a law school building was opened in 1923. Frank Le Rond McVey, Ph.D., resigned from the presidency in 1917 and was succeeded by Thomas F. Kane, Ph.D., LL.D.

NORTHERN TERRITORY. A territory of the Commonwealth of Australia, situated in the central and northern part of the continent. Area, 523,620 square miles, population, exclusive of aborigines, in 1911, 3310, in 1928, 4238. Occupation proceeded slowly; only 746 square miles had been alienated by 1927. Mineral production steadily has declined so that by 1926-27 the value of the total yield was only £22,222 (£55,299 in 1912). The trade records have made a similar showing: imports and exports for 1913, £20,977 and £67,911; for 1926-27, £36,814 and £29,786. Revenues and expenditures for 1913-14 were £73,657 and £532,535, for 1926-27, £122,062 and £431,512. Expenditures up to 1921 were heavy because of the Port Augusta Railway project. Up to June 30, 1927, the public debt, a charge on the Commonwealth, was £3,564,445. The policy of the Government is to dispose of the lands by leasehold only.

NORTH POLE. See POLAR RESEARCH.

NORTH SHORE MUSIC FESTIVAL. See MUSIC, Festivals.

NORTHWESTERN UNIVERSITY. An institution for the higher education of men and women, composed of the college of liberal arts, the graduate school, the school of engineering, and schools of commerce, journalism, music, education, and speech, in Evanston Ill.; and the schools of law, medicine, dentistry, commerce, and journalism, in Chicago. The College of Liberal Arts, the oldest school of the university, was founded in 1851. In the autumn of 1928, the enrollment was 11,105, including 5424 in the school of commerce in Chicago; in the summer session of that year 2115 were registered. In 1914 the enrollment was 4138. The faculty of the university numbered 742 in 1928, as compared with 450 in 1914. The endowment, as of June 30, 1928, was \$15,940,876, and the income from these funds for the fiscal year 1927-28 was \$816,852. The library, in 1928, con-

tained approximately 280,000 bound volumes and 150,000 pamphlets. During a campaign to raise funds which ended July 1, 1924, and which netted over \$8,000,000, a gift of \$4,223,000 was received from Mrs. Montgomery Ward, for the construction and endowment of the Montgomery Ward Medical-Dental Centre in Chicago; \$500,000 from Mrs. Levy Mayer for the construction of the Levy Mayer Hall for the law school; \$250,000 from Mrs. George R. Thorne, for the George R. Thorne Memorial Auditorium. In the following year, important gifts to the university included \$500,000 from the Weiboldt Foundation of Chicago, for the erection of Weiboldt Hall for the school of commerce in Chicago, and the Gary Law Library Building from E. H. Gary to house the Gary Law Library, in Chicago. In 1926 the sum of \$4,000,000 was received from Mrs. Montgomery Ward to be used for medical research. Walter Dill Scott, Ph.D., LL.D., was elected president in 1920, to succeed Lynn Harold Hough, LL.D., resigned.

NORTHWEST TERRITORIES. The name of the unorganized territories (Franklin, Keewatin, and Mackenzie) of the Dominion of Canada, with an area of 1,309,682 square miles, and a population in 1911 of 6507 and on June 1, 1929, of 9400 (estimated). Agriculture is carried on to a small extent only, because of the short summer season, but vegetable gardening has been successful on an experimental basis. With the discovery of oil at Fort Norman in 1920, interest in the territories quickened. Other minerals are known to exist. There are lead and zinc ores on the south side of the Great Slave Lake; gold in the Liard and Peel Rivers, and gypsum, salt, and coal, in considerable quantities. The lake fisheries and forest wealth are still inadequately explored; furs make up 40 per cent of the total Canadian output. The government is carried on under the direction of a commissioner assisted by a deputy commissioner and a council of five.

NORTON, THOMAS HERBERT (1851-). An American chemist and editor (see VOL. XVII). From 1915 to 1917, he was detailed by the U. S. Department of Commerce to further the development of American chemical industries, especially dyestuffs. From 1917 to 1920, he was chemist with E. I. du Pont de Nemours & Co and in 1917-18 he edited *The Chemical Engineer*. In 1920 he became editor of *Chemicals*. Among his later writings are *Dyestuffs for the American Textile Industry* (1915); *Cottonseed Industry in Foreign Countries* (1915); *The Dyestuff Census* (1916), and *Tanning Materials of Latin America* (1917).

NORWAY. A kingdom in northern Europe with a total area of 124,964.3 square miles. Its population in 1920 was 2,649,775, of which the urban numbered 785,404. The estimated population in 1928 was 2,787,827. Chief cities in 1920 were: Oslo (formerly Christiania), 258,483 (1910, 241,834); Bergen, 91,443 (1910, 84,330); Trondhjem, (to be known as Nidaros after 1930) 55,030 (1910, 45,335); and Stavanger, 43,778 (1910, 37,261). The total population in 1910 was 2,391,782, of which 713,262 was urban.

Agriculture. Approximately three-fourths of Norway is unproductive and forests are the principal resource of the remainder. In 1926 the area of arable land was 1,671,000 acres or 2.2 per cent of the total land area; there were 622,000 acres of permanent meadows, and 18,-

531,000 acres of forest. In the following year, there were 1,209,000 cattle, 300,000 swine, 1,608,000 sheep, 290,000 goats, and 183,000 horses. The acreage and production of the principal crops in 1927 were as follows: wheat, 24,560 acres, 563,000 bushels; rye, 23,000 acres, 634,000 bushels; barley, 149,000 acres, 4,747,000 bushels; oats, 239,789 acres, 12,169,000 bushels; mixed grain, 16,843 acres, 12,000 metric tons; potatoes, 123,000 acres, 22,232,000 bushels, hay 1,657,162 acres, 2,486,000 metric tons.

Industries. There is practically no domestic production of the nonmetallic minerals, but coal is being mined quite extensively on the Island of Spitzbergen where production at full capacity, it is predicted, would be able to supply the greater part of Norwegian demands. Water power is abundant and was being greatly utilized; the quantity developed up to 1929 was approximately 1,400,000 turbine horse power. The chief mineral products are silver, copper, pyrites, non ore, and nickel. In 1927 the total value of production in the mining industry was 21,260,000 kroner. Norwegian forests and fisheries are the chief natural sources of wealth. The total value of fisheries during 1927 was 177,919,743 kroner. The total area covered with forests is estimated at 28,956 square miles; value of planed and unplanned, sawn and unsawn timber products exported in 1927, 35,623,400 kroner, value of wood pulp and paper, 189,506,000 kroner.

Transportation. Length of state railways, 2025 miles, private railways, 229. Passengers carried by railways: (1927) 22,069,000. Volume of freight moved by railways, 9,802,000 metric tons.

Ocean Shipping. In 1927 vessels entering at Norwegian ports numbered 9094, of 7,027,453 net registered tons. Vessels clearing from Norwegian ports numbered 8891 of 6,938,904 tons. The Norwegian merchant marine, on Jan. 1, 1928, included 3698 vessels of 1,744,000 net tons. Gross earnings of merchant marine in 1927 reached 390,000,000 kroner, as compared with 430,000,000 for 1926. Norway does an extensive carrying trade all over the world. Its principal ports are Oslo, Bergen, Trondhjem, Narvik, Fredrikstad, and Haugesund.

Foreign Trade. Imports in 1928 were valued at 1,012,800,000 kroner, as compared with 552,321,000 in 1913. Export figures for the same years were 669,500,000 kroner and 380,910,000 kroner. The leading imports are ships, coal, iron and steel, and textile fabrics; the leading exports, wood pulp, paper, fish, wood, and aluminum. The United States supplied 14.3 per cent of the imports in 1926 and purchased 11.8 per cent of the exports; France, 3.9 and 6; Germany, 20.4 and 10; Great Britain, 19.5 and 28.5.

Finance. The total national debt on July 1, 1928, stood at 1,635,060,416 kroner. The gold and silver stocks, on Dec. 31, 1927, totaled 147,300,000 kroner; the amount of paper currency outstanding, 331,000,000 kroner. The exchange, which at par is \$.268 to the kroner, stood at 6.83 kroner to \$1 on Dec. 31, 1923, and at 7.42 kroner on Mar. 18, 1924. On May 1, 1928 the currency was stabilized at par on a gold basis. The proposed budget for 1928-29 balanced at 351,065,000 kroner.

History. Norway during the World War, like her neighbors, Sweden and Denmark, showed the unsettled conditions prevalent in all neutral countries. The policies of the three Scandina-

vian states, however, gravitated toward the same end. By the close of August, 1914, they had declared their neutrality; on December 19, agreements were definitely made by which all three pledged themselves to common action in the observance of this neutrality. Throughout the War, these conferences continued, with the result that the northern peoples were more firmly drawn together than ever before. The amity with which events were discussed made a pleasant picture against the dark background of the turbulent nationalistic aspirations of the rest of the European peoples. In fact, the movement thus started for the closer union of the Scandinavian populations soon reached an articulate form in the creation of the Norden Society in 1919. A Norwegian branch was opened on Apr. 12, 1919, an active publicity campaign was kept up, and year books were published.

During the War, extraordinary measures were necessary to shelter Norway's population as far as possible from the rigors of the hostilities. In November, 1914, a loan of \$4,000,000 was voted to cover extraordinary military expenses, and the Government tried to push the construction of the two warships then on the ways in English shipyards. A commission was created to regulate the importation and distribution of foodstuffs, and the fixing of prices was likewise established. Because of the setting up of the British blockade in 1914 and the restriction of shipping to a circumscribed area about Scandinavia, Norway's contact with the outside world was greatly hampered, and widespread distress ensued. Shipping suffered severely. In all, as a result of torpedoing and mines, 830 ships with a tonnage of 1,238,300 were lost, and about 2000 sailors were drowned. Yet in spite of difficulties that continuously increased, Norwegian sailors refused to be driven from the high seas and maintained their intercourse with countries at war, Great Britain in particular. As foodstuffs became scarce, prices naturally rose and labor unrest increased.

In 1916 demonstrations and strikes for the increase of wages involved almost 150,000 workmen, with the result that the Storting forced through a measure for compulsory arbitration. After the War, the return to regular conditions was slow. Norwegian workmen manifested a great interest in communist doctrines, and in 1919 and 1920 strikes, particularly on the railways, were frequent. Labor circles regarded sympathetically the attempts of Soviet Russia to open commercial relations in September, 1920, but the Norwegian government at first refused to take the step. In 1921 a commercial treaty was effected which granted Russia surprisingly liberal terms, and in March, 1924, *de jure* recognition was accorded. The Norwegian government even refused to press the claims of its nationals in Russia, which amounted to some 300,000,000 crowns.

Other matters of national interest after the War were the appointment of a royal commission in 1920, after much agitation, for the consideration of the creation of industrial works councils; and the passage by the Storting in 1917 of a measure tantamount to limited prohibition, which forbade the importation of liquors having more than a 12 per cent alcohol content. Two years later, permanent prohibition of spirits was introduced. An attempt to repeal prohibition by legislative act in 1924 failed, but in a plebiscite on Oct. 18, 1926, the majority in favor of repeal

was 110,000. The Storting accordingly undertook to repeal the Act of 1919 on Apr. 14, 1927. On May 2, 1927, new laws, allowing a sort of local option, went into effect. In 1922 a ship subsidy act was passed setting aside 25,000,000 crowns for government aid.

Labor troubles continued to make things unpleasant throughout the subsequent years. On Apr. 24, 1920, about 30,000 men in various industries went on strike against a proposed reduction in wages. In April, 1927, some 10,000 men struck for a similar reason. By this time, the string of strikes and lockouts was so long that the Government, in May, 1927, passed a law for the compulsory arbitration of labor disputes. The law was to be effective until April, 1929. In a spirit of self-defense, the Labor and Social Democrat parties drew together early in 1927 and presented a united front in the elections of October 17 of the same year. As a result of the coalition, Labor secured 59 seats in the new government, as against the 34 it had had in the old. This victory was followed by the setting up of the first Norwegian Labor government, on Jan. 26, 1928, under the Premiership of M. Hornsrud; but M. Hornsrud was forced to resign by February 10, because of the great unpopularity of his plans for a stricter system of taxation and for the suspension of military exercises in 1928 in preparation for complete disarmament. He was succeeded, on February 13, by the leader of the Radical Party, J. L. Mowinkel, who had been Premier for a while in 1924. In 1926 and 1927, the country was wrought up over the impeachment trial, begun on Oct. 4, 1926, of ex-Premier Abraham Berge and six members of his cabinet. The trial was held in the Supreme Court at Oslo, and the charge was the unconstitutional support of the *Norde Handelsbank* (Norwegian Bank of Commerce) in 1923-1924 by the secret depositing of government funds there at a time when the bank was in financial difficulties. The court dismissed the case in March, 1927.

Norway was quite successful in her foreign relations in the decade following the War. In 1922 the Permanent Court of Arbitration at The Hague awarded her \$12,000,000 against the United States for the seizure of Norwegian ships in American ports during the War. A long-standing dispute with Denmark over the sovereignty of Greenland was temporarily settled in January, 1924, by a treaty which left the chief point at issue undecided, but which safeguarded Norway's economic interests and claims there for a period of 20 years. The Spitzbergen Treaty, signed in Paris on Feb. 9, 1920, gave Norway the sovereignty over the Spitzbergen archipelago. The treaty went into effect on Aug. 14, 1925, when the Norwegian flag was first hoisted over the island group. On Jan. 19, 1928, Norway announced to England that she had annexed Bouvet Island in the South Atlantic as a whaling station, and that the Norwegian flag had been hoisted there on Dec. 1, 1927. After many months' negotiations, England, on Nov. 20, 1928, finally renounced all claims to the island. Then, on May 8, 1929, Norway decided to annex the island of Jan Mayen in the Arctic Ocean between Spitzbergen and Greenland. Denmark offered no opposition to this move. Naturally, Norway also became a party to a series of conciliation and arbitration treaties.

Norwegian nationalism asserted itself strongly in this period, too. On Jan. 8, 1924, Norway denounced the treaty of November, 1907, signed at

Christiania by herself, Great Britain, France, Germany, and Russia guaranteeing Norway's territorial integrity. From Jan. 1, 1925, Christiania was known as Oslo, and in the same year, Spitzbergen came to be known officially as Svalbard. (See *SVALBARD*.) As a further step in the "purification" of the country, the Government on June 10, 1929, changed the name of the city of Trondhjem to the more national Nidaros, to take effect from Jan. 1, 1930. This step, and the announcement that similar ones were to follow, caused a number of serious riots and demonstrations throughout the land, but the Government remained firm. On Mar. 15, 1928, began a tremendous celebration of the Ibsen Centenary in which the entire world participated.

NORWEGIAN LITERATURE. See *SCANDINAVIAN LITERATURE*.

NOTRE DAME, UNIVERSITY OF. A Roman Catholic institution for men at Notre Dame, Ind., founded in 1842. The university increased its student enrollment from 1077 in 1913, to 2991 in the autumn of 1928, and 1023 in the summer session; its faculty, during the same period, from 84 to 160; and its library from 65,000 to 200,000 volumes. A library was built in 1916, a chemical laboratory in 1917, a law college building in 1918, and two halls for freshmen and sophomores in 1923. An addition to the science hall was constructed in 1924 and a new residence hall for men in 1925, as well as an addition to the gymnasium. Gifts amounting to \$645,000 were received in 1921. In 1924 a new course was added in the school of education in "boy guidance" work. President, the Rev. Charles L. O'Donnell, C.S.C., Ph.D.

NOURISHMENT. See *FOOD AND NUTRITION*.

NOVAES, GUOMAR (1895-). A Brazilian pianist, born at Joao de Boa Vista. At the age of four, she began to play by ear, and it was not until she was seven that she received regular lessons from Chiafarielli in São Paulo. Her progress was so rapid that after only two years of instruction she was exhibited as an infant prodigy, making frequent appearances, but at the same time continuing to work systematically. In 1909 she won a scholarship at the Paris Conservatoire, where she remained two years under I. Philipp and graduated as winner of the first prize. After her highly successful debut in Paris (1911), she made tours of France, Germany, England, Italy, and Switzerland until 1913. During the next two years, she toured in Brazil and then appeared for the first time in the United States (New York, Nov. 11, 1915), where she won instantaneous and emphatic success. She later made several American tours. She married Ottavio Pinto in 1922.

NOVA SCOTIA, nō'va skō'sha. A Canadian maritime province with an area of 21,428 square miles. The population in 1911 was 492,338; in 1921, 523,837, which represented a gain of 6.4 per cent; estimated at 550,400 on June 1, 1929. Of the population in 1921, 56.7 per cent was rural, as compared with 62.2 per cent in 1911. The leading cities, with their populations in 1921, are Halifax, 58,372 (46,619 in 1911); Sydney, 22,545 (17,723 in 1911); Glace Bay, 17,007; Dartmouth, 7899; Amherst, 9998; New Glasgow, 8974; Sydney Mines, 8327; Truro, 7562. Cape Breton Island is an integral part of the province.

Industry. Agriculture is the leading activity. The geographical situation of the province favors the cultivation of hay, and 844,000 tons

were cut in 1927. Other important crops are potatoes, oats, and wheat. The growth of fodder crops and the presence of an important livestock industry makes dairying particularly important. The value of live stock was put at \$19,355,000 in 1926; wool is important. Agricultural products, in all, yielded \$41,251,000 in 1926. Forest products totaled \$14,500,000 in 1926. Fisheries continue to absorb the attention of a considerable part of the population. Cod, lobsters, haddock, herring, and mackerel were the most important of the 1927 catch with a total value of \$9,500,000, as against \$7,384,055 in 1913. In 1926, 20,000 men were engaged, and the whole industry represented a capital of \$12,785,188. In 1928 the output of the fisheries amounted to \$11,570,387, codfish alone bringing \$4,406,507. Bituminous coal is by far the most important mineral product. The output in 1926 was 6,747,477 tons, valued at \$33,200,000, and was distributed largely among the other maritime provinces. Gold continues to decline; the 1926 yield was only \$34,687, as against \$44,935 in 1913. Pig iron also showed decreases for the years following 1913. In all, in 1927, Nova Scotia's mineral products were valued at \$30,111,221, almost 12 per cent of the total Canadian production. In 1925 there were 1184 industrial establishments (1480 in 1910) employing 16,568 workers and capitalized at \$117,326,491 (\$79,596,341 in 1910). The cost of materials was \$37,854,196 and the gross value of products \$65,033,201 (\$52,706,184 in 1910). The following industries are important manufacture of coke, iron and steel products (\$6,967,662 in 1925), shipbuilding, sugar refining, boot and shoe manufacturing, etc.

Trade and Communications. Imports entered for consumption in 1927 were \$23,479,462 (\$20,753,369 in 1912-13), exports were \$53,226,985 (\$24,201,473 in 1912-13). In 1927 there were 1451 miles of railway, as compared with 1360 in 1913. Some 18,000 miles of highways kept in good repair make intraprovincial communication easy. This is further facilitated by numerous subsidized boats plying the shore.

Government. The suffrage is exercised by both sexes. Revenues in 1914 were \$1,885,000; in 1927, \$6,517,072. The Dominion subsidy yielded \$661,841 in 1926. Other sources are royalties on coal lands and other provincial properties, succession duties, etc. There is no direct taxation. Expenditures in 1913 and 1927 were \$2,098,893 and \$6,566,143. In the same period, the debt grew from \$12,615,086 to \$41,708,457. For the year 1926-27, 112,556 pupils were enrolled at 3113 schools. Total cost of education was \$3,605,401, as compared with \$1,439,742 in 1913. There is a normal school and an agricultural school at Truro, and a technical school at Halifax. Representation in Parliament: House of Commons, 14; Senate, 10.

NOYES, noiz, ALFRED (1880-) An English poet (see VOL. XVII). From 1914 to 1923, he was professor of modern English literature at Princeton University. In 1916 he was in the British Foreign Office for a short time, and in 1918 was made a commander of the Order of the British Empire. His later prose works were *Walking Shadows*, short stories (1917); *Open Boats*, an account of naval operations (1917); *Aspects of Modern Poetry*, essays (1924); and *New Essays and American Impressions* (1927). His later poems include *A Salute From the Fleet* (1915); *The New Morning* (1918); *The Elf*

Artist (1920); *Collected Poems*, vol. iii (vols. i and ii in 1910) (1920); *Selected Verse* (1921); *The Torchbearers*, "an epic of scientific discovery," vol. i being *The Watchers of the Skies, or famous astronomers* (1922); and vol. ii, *The Book of the Earth*, scientists from Pythagoras to Darwin (1925); *Dick Turpin's Ride* (1927); and *Ballads and Poems* (1928).

NUTRITION. See FOOD AND NUTRITION.

NUTS. See HORTICULTURE.

NYASALAND PROTECTORATE. A British protectorate in southeastern Africa on the southern and western shores of Lake Nyasa. Area, 37,890 square miles; population (1927), 1,304,123 natives; 1829 Europeans; 982 Asiatics. In 1911 there were 766 Europeans and 481 Asiatics. The chief settlement, Blantyre, in the Shire Highlands, has some 400 Europeans. In the same locality, coffee is cultivated, as well as tobacco, cotton, and tea. The crops showing the greatest advances are tobacco and tea, while cotton and coffee are falling behind. Tobacco exports in 1912-13 totaled 2,262,545 pounds; in 1927, 15,466,032. Leading imports are cotton piece goods, rice and grain, sugar, and petroleum. Imports in 1913-14 were £208,711; 1921, £637,567, 1927 (April to December), £938,461. Exports in 1913-14 were £266,089; 1921, £416,404; 1927 (April to December), £960,869. The trade does not include specie or goods in transit. Of the exports, 97 per cent went to the United Kingdom, 44 per cent of the imports came from the United Kingdom and 20 per cent from British possessions. The following figures show the course of administrative charges, revenues for 1913-14 and for 1927, £124,849 and £348,320; expenditures for same years, £133,106 and £318,300. The public debt of the protectorate in 1927 was £727,105. To this must be added £3,000,000 borrowed from Great Britain to finance campaigns in German East Africa during the World War. To bring the protectorate into ready communication with the Indian Ocean, a railway from Chindio, in Portuguese East Africa, to Blantyre (174 miles) was constructed. In 1922 another line connecting Blantyre with Beira in Portuguese East Africa was opened. The extension of the railway system northward to Lake Nyasa, on which so much depended, was still only contemplated in 1929. The settlers were involved in the War because of the proximity of German East Africa. Most of the Europeans saw service, as well as almost 200,000 natives in the rôle of carriers. The natives continued orderly except for a single uprising in 1915, which was soon quelled.

NYE, GERALD P. (1892-). A United States Senator, who was born at Hortonville, Wis., and attended the Wittenberg, Wis., high school. He engaged in country newspaper work in Wisconsin, Iowa, and, after 1915, in North Dakota, settling at Cooperstown, N. D., in 1919 and becoming editor and manager of the *Griggs County Sentinel-Courier*. In 1923 he was defeated as a candidate for Representative in Congress on the Independent ticket. Two years later, he was appointed by Governor Sorlie to fill an unexpired term as United States Senator and was seated after controversy in the Senate over the governor's right to appoint. In June, 1926, he was elected as a Progressive Republican for the short term and in November for the full term.

O

OAKLAND. The third city of California. The population increased from 150,174 in 1910 to 216,261 in 1920 and to 274,100 in 1928, by estimate of the Bureau of the Census. In 1923 Oakland joined with eight neighboring cities to purchase the East Bay Water Company and to develop new sources of water supply for the district. The initial cost of the project was \$39,000,000, in addition to which the cities voted \$26,000,000 in 1927 to acquire a complete distributing system from Paidea Dam, which provides the main storage for the new supply from the Mokelumne River through a 95-mile aqueduct. In 1923 the city also purchased a site on the shore of Lake Merritt on which to erect a museum. A bond issue, amounting to \$9,600,000, was voted in 1925 for the development of the city's water front. In 1928 Oakland completed the erection of three high schools and six junior high schools authorized by a \$5,000,000 bond issue voted in 1919. The Oakland airport, erected at a cost of \$2,000,000, is one of the largest airports in the United States and is operated as a municipal terminal facility by the Board of Port Commissioners; approximately 8000 landings are made each month. In 1928 the George A. Posey Tube, a vehicular tunnel under the estuary between Oakland and Alameda, was completed. See TUNNELS. In 1925, 15,537 wage earners were employed in Oakland's 125 industries and received \$21,654,000 in wages; the value of products manufactured was \$144,841,000. Building permits increased 368 per cent, from \$4,442,520 in 1917 to \$20,794,669 in 1927. Bank clearings increased 259 per cent, from \$269,219,938 in 1917 to \$1,046,041,000 in 1928. The assessed valuation of property in 1928 was \$252,012,045; the net debt was \$35,528,839.

OATS. Among the cereal crops in the United States, oats are exceeded only by corn and wheat in acreage and value. The average annual production for the years 1919 to 1928, inclusive, was 1,314,939,000 bushels and, similarly, the annual production for the three leading States was 213,194,000 bushels for Iowa, 143,364,000 for Minnesota, and 139,520,000 for Illinois. During the World War, there was a general increase in acreage and production in the United States, while in Europe, the crop decreased and for a number of years did not regain its normal status. The United States Grain Standards Act requires oats in interstate commerce to be inspected by a licensed inspector and graded by him on the basis of official standards. According to these standards, effective since June 16, oats are classified for commercial purposes as white (including yellow), red, gray, and black oats. Each class is divided into four grades on the basis of condition and general appearance, test weight per bushel, sound oats, heat damage, wild oats, and mixtures of other classes of oats. In addition, there is a "sample grade" for oats too poor to come within the numerical grades. Since

then, grades have been added for chemically bleached, weevily, and cereal oats, and standards for feed oats and mixed feed oats. Consult U. S. Department of Agriculture *Year Book*, 1922 and 1927.

OBER, o'bër, MARGARETE (1885-). A German dramatic mezzo-soprano, born in Berlin. She studied there with Benno Stolzenberg and, later, Arthur Arndt, whom she married in 1910. After her début at Frankfurt in 1906, as Azucena, she was engaged at the Stadttheater in Stettin, where her extraordinary voice and superior talent as an actress attracted the attention of Von Hulsén, who in 1907 engaged her for the Royal Opera in Berlin. Her American début as Ortrud at the Metropolitan Opera House (Nov. 21, 1913) was one of the sensations of the season. From 1913 to 1917, she divided her time between New York in the winter and Berlin in the summer and sang as guest in other principal German opera houses and in Amsterdam. When the Royal Opera became the Staatsoper in 1919, she was retained as one of the principal stars. Her interpretation of the great Wagner rôles and of the German *lieder* is considered unexcelled.

OBERHUMMER, o'bër-hum'ër, EUGEN (1859-). A German geographer, professor in the University of Vienna since 1903 (see Vol. XVII). His later works include *Imperialism* (1920); *Ferdinand Magellan* (1921); *Ratzel* (1923); *Weltkarte des 19-Jahrhunderts* (1924).

OBERLIN COLLEGE. A nonsectarian institution for men and women at Oberlin, Ohio, founded in 1833. There was only a slight variation in the enrollment of students during the period 1914-28, since the college limited the attendance of students to the number that it could efficiently care for with its classrooms, laboratories, and dormitories. In the autumn term of 1928, the registration was 1617, while that of the summer session was 185. The faculty increased from 157 in 1913 to 248 in 1927-28. The library contained 241,000 bound volumes and 178,000 pamphlets in 1924, and 299,179 volumes and 200,429 pamphlets in 1928. New buildings erected during the period under review included: An art building in memory of Dr. Dudley P. Allen, given by Mrs. Allen, an administration building erected in memory of Gen. Jacob Dolson Cox, and a hospital. In November, 1923, Oberlin entered upon a campaign to raise \$4,500,000 for new endowment and buildings, and by Jan. 1, 1924, had received gifts and pledges to the amount of \$3,000,000, including a contribution of \$500,000 from the General Education Board. A gift of \$100,000 from Andrew H. Noah, of Akron, announced in November, 1927, was the first contribution to a fund to be raised for the construction of residence halls for men students. Henry Churchill King, D.D., LL.D., was succeeded by Ernest Hatch Wilkins, Ph.D., Litt.D., LL.D., as president in 1927.

OBREGÓN, obrá-gón', ÁLVARO (1880-1928). A Mexican soldier and President (see Vol.

XVII). In 1914 he became commander of the Constitutional Army of the West, and after defeating Zapata and Villa, he entered Mexico City in August of that year. Then followed a period of civil strife, General Obregon victoriously supporting Carranza against Villa and Zapata, and losing his right arm from a severe wound received at Celaya (1915). During Carranza's presidency, Obregon remained at the head of the army, and in 1920 became a candidate for President. When Carranza ordered his arrest, Obregon headed a successful revolt and was elected President. He started far-reaching labor, agrarian, and educational reforms, and his government finally received the recognition of the United States on Aug. 31, 1923. The close of his term was marked by the unsuccessful revolt of de la Huerta, who opposed Calles's candidacy for the Presidency. After four years of official inactivity, Obregon was reelected President on July 1, 1928. He was assassinated on July 17, before he had entered on his second term. See MEXICO, *History*.

O'BRIEN, EDWARD JOSEPH HARRINGTON (1890-). An American author and editor, born at Boston, Mass. He studied at Boston College and at Harvard and from 1912 to 1915, was editor of *The Poetry Journal*. In the year following, he was editor of *Poet Lore*. He wrote *The Flowing of the Tide*, a play (1910); *White Fountains*, verse (1917); *The Bloody Pool* (1917); *Instant Music* (1921); *Hard Sayings* (1922), and *The Advance of the American Short Story* (1923). He edited *The World's History at a Glance* (1913), *Poems of the Irish Revolutionary Brotherhood* (1917); and from 1915 to 1928, edited with John Cournos *The Best Short Stories* and *The Best British Short Stories*. He also translated several books from the French and other languages.

O'BRIEN, FREDERICK (1869-). An American writer, born in Baltimore, Md., and educated at the Jesuit College in Baltimore and the University of Maryland. At the age of 18, he went to sea and for many years thereafter traveled extensively. He was at various times connected with newspapers in New York, San Francisco, Manila, and Paris. During the World War, he served with the Food Administration in California and in Washington D. C. As a result of a sojourn in the islands of the South Seas, he wrote *White Shadows in the South Seas* (1919). This was immediately successful and was followed by *Mystic Isles of the South Seas* (1921), and *Atolls of the Sun* (1922).

O'BRIEN, WILLIAM (1852-1928). An Irish journalist and parliamentary leader (see VOL. XVII). With his colleagues of the All-for-Ireland League, he withdrew from Parliament at the general election of 1918 and thereafter lived quietly at Mallow, engaged mainly in writing. His later works were *Evening Memories* (1920); *The Irish Revolution and How It Came About* (1923); *Edmund Burke as an Irishman* (1924); *The Parnell of Real Life* (1926).

OBSTETRICS. See ABORTION

O'CASEY, SEAN (1890-). An Irish playwright, born in Dublin of poor parents. He worked at various forms of unskilled labor and lived in the cheerless tenement district of Dublin, frequently in danger of his life because of his activities in the Easter Rebellion of 1916. His plays, given at the Abbey Theatre, were stirring accounts of the life of the Irish city worker, objectively written, with bitterness and a feeling

of disillusionment running through them, tense situations relieved by whimsical or hilarious humor, as the case might be, and a pacifist's emphasis on the horrors of war. The best known were *The Shadow of a Gunman* and *Juno and the Paycock*, published as *Two Plays* in 1925, *The Plough and the Stars*, an account of the Easter Rebellion of 1916 (1926); and *The Silver Tassie* (1928).

OCCIDENTAL COLLEGE. A coeducational residence college of liberal arts and sciences at Los Angeles, Calif., founded in 1887 under Presbyterian auspices, but nonsectarian since 1910. The number of students increased from 311 in 1915 to 718 in 1927-28, the faculty from 25 to 74 members; the endowment from \$161,027 to \$952,637, and the annual income from \$129,961 to \$271,000, for the year ending in June, 1928. The physical plant included a campus of 83 acres, nine principal buildings and a number of minor structures. The college library in 1928 contained a total of 26,000 volumes. Occidental College was fully accredited in 1918 by the Association of American Universities and in 1926 received a chapter of Phi Beta Kappa, the Delta Chapter of California. The graduate school and the school of education were founded in 1922, and a campaign to raise \$500,000 in 1924 was oversubscribed by \$150,000. The women's gymnasium and the president's house were built in 1922; the library, an anonymous gift in honor of Mrs. Mary Norton Class, was completed in March, 1924, at a cost of \$150,000; Orr Court, a women's building and residence court, given by William Mead Orr in honor of Bertha Harton Orr, was erected; and a student union, providing social and dining halls, was one of the most recent additions to the plant. President, Remsen D. Bird, D.D.

OCEANOGRAPHY. See EXPLORATION.

OCHS, ADOLPH S. (1858-). An American newspaper publisher (see VOL. XVII). In 1926 he arranged to supply funds to be used by the Council of Learned Societies in the preparation of manuscript for the *Dictionary of American Biography* over a period of 10 years. He was made a commander of the Legion of Honor (France) in 1919 and received the honorary degree of LL.D. from Columbia University (1924), the University of Chattanooga (1925), and New York University (1926). In May, 1927, he received the gold medal of the National Institute of Social Sciences for "developing and maintaining high standards of journalism."

OCHS, SIEGFRIED (1858-1929). A famous German choral conductor (see VOL. XVII). In 1920 the unfavorable conditions of the post-war period compelled him to dissolve the Philharmonic Choir in Berlin, part of which was absorbed by the chorus of Staatliche Hochschule für Musik. Ochs himself joined the faculty of this institution as professor of choral music and conductor of the chorus, a post which he filled with signal distinction until his death. He wrote *Der Deutsche Gesangverein* (4 vols., 1923); *Über die Art Musik zu hören* (1926); and his autobiography under the title *Geschichten, Gesehnes* (1922).

OCHSNER, ALBERT JOHN (1858-1925). An American surgeon (see VOL. XVII). In 1916 he wrote the surgical section of Smith's *Cancer of the Stomach*, and in 1917, assisted by Percy,

he brought out a new edition of his work, *A New Clinical Surgery*, with the title *A New Manual of Surgery, Clinical and Military*. A large four-volume system of surgery edited by Ochsner, *Surgical Diagnosis and Treatments by American Authors*, was published in 1920. During the War, he was a major of the Medical Reserve Corps.

O'CONNOR, ANDREW (1874-). An American sculptor (see Vol. XVII). His later important works include the fine "Soldier," Worcester, Mass.; "Serenity," part of the monument to General Thomas, Tarrytown, N. Y.; "Inspiration," St. Louis Museum, and especially a bronze "Lincoln" (Springfield, Ill.), which has caused much discussion.

O'CONNOR, RT. HON. T(HOMAS) P(OWER) (1848-1920). An Irish journalist and parliamentarian (see Vol. XVII). While continuing to represent the Scotland Division of Liverpool in Parliament, he became editor of *T. P.'s and Cassell's Weekly* in 1923 and wrote for the *Sunday Times* and other journals. He was made a Privy Councillor in 1924 and in 1929 published *Memoirs of an Old Parliamentarian*.

OFFICERS' TRAINING CAMPS. See ARMIES AND ARMY ORGANIZATION.

OGG, FREDERIC AUSTIN (1878-). An American teacher of political science, born at Solsberry, Ind., and educated at DePauw, Harvard, and Indiana universities. From 1905 to 1913, he was a member of the faculties of the Boston University and Simmons College. In the latter year, he was appointed associate professor at the University of Wisconsin, where after 1917 he was professor of political science and after 1925, chairman of the graduate division of social studies. He wrote *The Opening of the Mississippi—A Struggle for Supremacy in the American Interior* (1904); *Social Progress in Contemporary Europe* (1912); *Life of Daniel Webster* (1914); *Economic Development of Modern Europe* (1917); "The Old Northwest and Reign of Andrew Jackson" (in *Chronicles of America*, vols. xix and xx; 1919); *National Governments and the World War*, with C. A. Beard (1919); *Introduction to American Government*, with P. O. Ray (1921); *Research in Humanistic and Social Sciences* (1927). He was editor of *The Century Political Science Series*.

O'HIGGINS, HARVEY J (1876-1920). An American writer, born in London, Ont., and educated at the University of Toronto. He began his career as a writer by the publication of *The Smoke Eaters* (1905). This was followed by *A Grand Army Man* (1908); *The Beast and the Jungle*, with Judge Ben B. Lindsey (1910); *Polygamy* (1914); *From the Life* (1919); *The Doughboy's Religion*, with Judge Lindsey (1919); *Secret Springs* (1920); *Some Distinguished Americans* (1922); *The American Mind in Action*, with Edward H. Reede (1924); *Clara Barron* (1925). He also wrote several plays with Harriet Ford. Some of these were successfully produced.

OHIO. The thirty-fifth State in size (41,040 square miles) and the fourth in population; capital, Columbus. The population increased from 4,767,121 in 1910 to 5,759,394 in 1920, a gain of 20.8 per cent; estimated population, 1928, 6,828,000. The white population increased from 4,654,897 (1910) to 5,571,893 (1920); Negro, from 111,452 to 186,187; native white, from 4,057,052 to 4,893,196; foreign-born white, from 597,245 to 678,697. The urban population rose from 2,665,143 to 3,677,136; the rural population, on the other hand, fell from 2,101,978 to 2,082,258. The growth of the principal cities was as follows: Cleveland, from 560,663 in 1910 to 796,841 in 1920; Cincinnati, 363,591 to 401,247; Toledo, 168,497 to 243,164; Columbus, 181,511 to 237,031; Akron, 69,061 to 208,435. See articles on these cities.

Agriculture. As Ohio is an important grain-growing State, agricultural conditions have been affected by the fluctuations in production and prices of grain during the World War and the post-war period. The general agricultural history of the period is treated under AGRICULTURE, CORN, WHEAT, BARLEY, etc. The number of farms, which had decreased 5.6 per cent, or from 270,045 in 1910 to 256,695 in 1920, decreased further by 4.8 per cent, to 244,703 in 1925. The acreage of land in farms, 23,515,888 in 1920, decreased to 22,219,248 in 1925, or by 5.5 per cent. The improved land in farms was 18,542,353 in 1920. The percentage of total area in farms decreased from 92.5 in 1910 to 90.2 in 1920 and 85.2 in 1925. Farm land values increased in the war period. The total value of farm property rose from \$1,902,694,589 in 1910 to \$3,095,666,336 in 1920 or 62.7 per cent, but receded to \$2,236,901,636 in 1925; the average value per farm was \$6994 in 1910, \$12,060 in 1920, and \$9141 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 181,346 were operated by owners; 1060, by managers; and 62,296, by tenants. The comparative figures for 1910 are 192,104; 2753; and 77,188. White farmers in 1920 numbered 255,079; colored farmers 1616. In 1910 white farmers numbered 270,095 and colored farmers, 150. Farms reported as under mortgage, 50,784 in 1920, numbered 47,800 in 1925. The total number of cattle in 1920 was 1,920,823; in 1925, 1,652,594; there were 1,349,373 dairy cows in 1920, 839,880 in 1925. Sheep in 1920 numbered 2,102,550; in 1925, 1,941,023; swine, 3,083,846 in 1920; 2,367,570 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 136,725,000 bushels; wheat, 9,475,000; oats, 89,281,000; barley, 9,191,000; potatoes, 12,054,000; hay, 3,706,000 tons; tobacco, 33,440,000 pounds; and sugar beets, 281,000 short tons. Comparative figures for 1913 are corn, 146,250,000 bushels; wheat, 35,100,000; oats, 54,360,000; barley, 960,000; potatoes, 10,240,000; hay, 3,848,000 tons; and tobacco, 61,425,000 pounds.

MINERAL PRODUCTS IN OHIO

Year	Net tons	Valued at	Clay products		Petroleum	
			Valued at	Barrels	Valued at	
1914	18,843,115	\$ 21,250,642	\$37,166,768	8,536,352	\$13,372,729	
1915	22,434,691	24,207,075		7,825,326	10,061,498

Manufactures. Ohio is one of the most important States industrially. In 1920 there were more than 50 cities having more than 10,000 inhabitants and forming 54.5 per cent of the total population of the State. These cities reported 79.6 per cent of the State's manufactured products in 1919. There were 15,138 manufacturing establishments in the State in 1909; 16,125 in 1919; 11,131 in 1925; and 10,961 in 1927. Wage earners in manufactories numbered 730,733 in 1919, 676,661 in 1925, and 669,097 in 1927. The capital invested amounted to \$1,300,732,732 in 1909 and \$3,748,743,996 in 1919. The value of products was \$1,437,935,817 in 1909; \$5,100,308,728 in 1919; \$5,345,592,745 in 1925; and \$5,230,323,268 in 1927. The increase in value of products about 1919 was due largely to changes in industrial conditions brought about by the War and cannot be properly used to measure the normal growth of manufactures during that period. The most important industry in point of value of products is iron and steel, amounting to \$197,780,000 in 1909; \$626,370,000 in 1919; \$968,264,055 in 1925. Foundry and machine-shop products totaled \$145,837,000 in 1909; \$178,855,000 in 1914; and \$527,079,000 in 1919. A very extensive manufacture of rubber tires and rubber goods attained a total annual production of \$53,911,000 in 1909; \$551,118,000 in 1919; \$556,262,424 in 1925. The manufacture of automobiles, bodies, and parts, likewise important, had a product valued at \$38,839,000 in 1909; \$379,436,000 in 1919; and \$514,775,843 in 1925. The principal manufacturing cities of the State are Cleveland, Akron, Cincinnati, and Toledo. In Cleveland, there were 2148 manufacturing establishments in 1909, with a product valued at \$271,961,000; 2946 in 1919, with \$1,091,577,000; and in 1925, products valued at \$1,094,780,000. In Cincinnati, there were 2183 establishments in 1909, with \$192,516,000; 2239 in 1919, with \$500,041,000; and in 1925, products valued at \$457,539,000. Akron had 246 factories in 1909, with products valued at \$73,158,000; 304 in 1919, with \$558,962,000; and in 1925, products valued at \$565,391,000. Similar figures for Toledo were 760 in 1909, with \$61,230,000; 671 in 1919, with \$293,521,000; and in 1925, products valued at \$371,120,000. Other important manufacturing cities are Columbus, Dayton, Canton, Springfield, and Youngstown.

Education. Among the advances leading to the present stage of education in Ohio were county school systems and trained teachers. There was no supervision of rural schools until 1914, when county boards of education were established. These boards elect county superintendents of schools and, if necessary, assistants. Hundreds of centralized rural schools of the best type have been built under the new régime; most of these included high schools. No training was required of teachers prior to 1914, except by certain city boards of education. The requirements were increased gradually, until the standard rose in 1921 to a full year of normal work, which is, in effect, a year beyond a four-year high-school course. Two new State normal schools were started in 1913; and a county normal school plan was adopted to supplement the other agencies for preparing elementary teachers. There soon were over 50 such schools with work of strictly collegiate grade. Some of the private colleges, of which there are many in Ohio, also undertook to train elementary teachers, under the supervision of the State Department of Education.

By 1924 all but two of the standard colleges prepared high-school teachers with the large amount of professional training required by the 1914 law. High-school supervision by the State University was merged with that of the State Department of Education. Most high schools rose to first-grade rank. A compulsory-education law of 1921 required attendance to the age of 18 of those not through high school; those fitted might secure work certificates at 16. Other advances include much improvement in day schools for blind, deaf, and crippled; State and many county supervisors of music; moving-picture censorship under State director of education; establishment of Smith-Hughes vocational work, especially strong in part-time industrial education; a model teachers'-retirement law; increase of State aid to weak school districts from about \$200,000 to \$2,400,000 with the administration entirely under the State director of education. The enrollment increased from 895,167 in 1914 to 1,255,323 in 1925-26; of the latter number, 1,031,644 pupils were enrolled in elementary grades; 223,679 in high schools. Expenditure for public day schools in 1925-26 was, current, \$103,367,178; outlays, \$24,212,244. Illiteracy in the State decreased from 4 per cent in 1910 to 3.6 per cent in 1920; in the native white population, from 2.2 to 1.2 per cent; among the foreign-born white, rose from 11.8 to 13.4 per cent; and among the Negroes, fell from 13.9 to 9.7 per cent.

Finance. State expenditure in the year ended June 30, 1927, as reported by the U. S. Department of Commerce was for maintenance and operation of governmental departments, \$41,843,672 (of which \$3,111,486 was aid to local education); for conducting public-service enterprises, \$109,536; for interest on debt, \$976,174; for permanent improvements, \$10,912,780; total, \$53,842,162 (of which \$19,086,268 was for highways, \$13,176,744 being for maintenance and \$6,509,524 for construction). Revenues were \$53,627,085. Of this, property and special taxes formed 20.7 per cent; departmental earnings and charges for officials' services, 11.3 per cent; sales of licenses and taxation of gasoline, 47.6 per cent. Property valuation was \$13,350,444,355; State taxation thereon, \$3,337,611. Net funded State debt on June 30, 1927, was \$19,127,835.

Political and Other Events. The Republican Party has repeatedly alternated with the Democrats in political control in recent years. In 1914 Harding, former lieutenant governor, was elected Senator by the Republicans, who also elected, as governor, Frank B. Willis. An amendment establishing county local option was carried in this election, while amendments providing for woman suffrage and prohibition were defeated. In April, 1914, the coal mines of the State were shut down as the result of the failure to negotiate a wage agreement. The strike caused great suffering to the miners and huge losses. In 1915 a constitutional amendment forbidding the sale of intoxicating liquors was submitted to the people and was rejected. Severe floods in the State, in July, 1915, resulted in five deaths and damage above \$2,000,000,000. In 1916 James M. Cox, running for governor, with the entire State Democratic ticket, was elected, and Senator Pomerene was reelected. For President, Wilson received 604,161 votes; Hughes, 514,753. Riots in East Youngstown among the steel workers resulted in great damage to property and the destruction of

practically the entire business section by fire. In 1917 the voters defeated a law permitting women to vote for presidential electors, and rejected a prohibition amendment.

Governor Cox was reelected in 1918, and a State-wide prohibition amendment was adopted. The Republicans in 1920, elected their candidate for governor, Harry L. Davis, while Frank L. Willis was elected to the Senate. In that year, both candidates for President were natives of Ohio. For President, Harding received 1,182,022 votes; Cox, 780,037. In 1921 at a special election, the people ratified a soldiers' bonus of \$25,000,000. In 1922 the Democratic nominee, A. V. Donahey, was elected governor. He was reelected in 1924 and in 1926. In 1922 the constitutional amendment providing for the sale of beer and light wines was proposed, but the Secretary of State refused to certify it. The Supreme Court ordered him to place the proposal on the ballot. It was rejected by the people by a majority of over 180,000 votes. In 1923 the people rejected an old-age pension proposal. On June 28, 1924, the city of Lorain and others west of it were swept by a tornado which did damage of more than \$50,000,000 and took 94 lives, 71 of them in Lorain.

The presidential vote of 1924 was: Coolidge, 1,176,130; Davis, 477,888; LaFollette, 357,948. A species of proportional representation in the election of councilmen in Cincinnati went into effect in 1925. The State act allowing justices of the peace to share in the proceeds of fines that they inflicted was invalidated in 1927 by the U. S. Supreme Court, thus virtually abolishing these magistrates. The disclosure of municipal corruption in Canton by a newspaper editor, Don R. Mellett, led to his murder in 1926 by members of the police force, and aroused widespread resentment against corruption in office. In 1928 the vote for President was: Hoover, 1,627,543; Smith, 964,210. Myers Y. Cooper, Republican, was elected governor.

Legislation. Two special sessions were held in 1914. An act was passed reorganizing the agricultural interests of the State and creating an agricultural commission. The common school system was also reorganized. A law was passed in 1917 permitting women to vote for President but was defeated by the voters. The Federal Prohibition Amendment was ratified by the Legislature on Jan. 7, 1917, but on November 4 of that year, the amendment was rejected by the voters by a majority of 542. In 1919 statutes were passed defining and punishing criminal syndicalism and sabotage and forbidding the teaching of German in the elementary grades of public and parochial schools. The Legislature of 1921 amended the compulsory education laws; made provision for cooperative marketing; passed measures for the enforcement of the prohibition law, and amended the laws relating to the finances of the State. The Legislature in 1923 created a judicial council of nine judges. The State adopted a two-cent gasoline tax in 1925, and made the rate three cents in 1927. A measure to reform the system of justices of the peace, regulating their remuneration in conformity with constitutional requirements, was enacted in 1927 but failed of ratification by popular vote.

OHIO NORTHERN UNIVERSITY. An institution of higher learning at Ada, founded in 1871, and under the direction of the Methodist Episcopal Church; consisting of the George

Franklin and Sarah Catherine Getty College of Liberal Arts, colleges of education and engineering and pharmacy, the Warren G. Harding College of Law, the A. D. Juilliard College of Music, a school of commerce, and departments of expression, fine arts, and physical education. The enrollment increased from 1051 in the autumn of 1924 to 1189 in the autumn of 1928, the faculty from 45 to 62, the library from 11,000 to 15,000 volumes, productive funds from \$316,000 to \$542,860, and the income from \$209,376 to \$352,925. Additions to the buildings included a newly equipped museum, in 1924; and a new gymnasium and a music hall in 1928. President, Albert Edwin Smith, Ph.D., D.D., LL.D.

OHIO RIVER. See CANALS.

OHIO STATE UNIVERSITY. A State institution of higher education for men and women at Columbus, founded in 1870 and supported by appropriations from both State and Federal governments. The enrollment of the University more than doubled between 1914 and the autumn of 1928, increasing from 4466 in the former year to 10,412 in the latter, with an additional 3504 students in the summer session. In the same period, the faculty increased from 423 to 883, the library from 138,101 to 310,000 volumes, and the income from \$1,276,134 to \$6,804,063. The University had 10 colleges and a graduate school in 1924 and had added two more colleges by 1928. In 1914 the Sterling Ohio Medical College, including the dental school, was incorporated as part of the University, and the college of commerce and journalism was added in 1916. During 1922-24, new buildings constructed included Mack Hall, a residence hall for women, Pomereene Hall, a women's gymnasium, the Ohio Stadium; a new administration building, new commerce building; journalism building, chemical laboratories; Hamilton Hall, medical science building, an art studio; and new structures for beef cattle, dairy cattle, hogs, and sheep; while contracts were let for a new university hospital, an addition to the medical science building, and an appropriation of \$50,000 was made for the erection on the campus of a residence for the president of the University. During this period, the University began to operate on the four-quarter system, abandoning the semester plan, with such an arrangement in the schedule that a student might enter at the beginning of any quarter. President, George W. Rightmire, LL.D.

OHIO UNIVERSITY. A State institution of higher education, at Athens, Ohio, founded in 1804. Attendance in all departments was 2276 in the autumn of 1914 and 2215 in the autumn of 1928, and in the summer session of the latter year, 1098. The faculty increased from 85 to 260; the library from 47,000 volumes to 63,900; the productive funds decreased from \$150,000, chiefly land endowment, to \$71,802 in 1925, and income increased from \$289,566, to \$1,209,936 for the year 1924-25, including appropriation by the Legislature for additions for the biennium 1925-27. President, Elmer Burritt Bryan, LL.D., LL.D.

OHIO WESLEYAN UNIVERSITY. An institution of higher learning for men and women at Delaware, Ohio, under the control of the Methodist Episcopal Church, founded in 1844. The student enrollment increased from 1126 in 1914 to 1803 in the autumn of 1928; the faculty was increased in membership from 66 to 163, and the library from 66,210 to 118,000

volumes. During the period under review, departments in education, home economics, business administration, and religious education were founded; Austin Hall was built; the Perkins Observatory was constructed; the Z. E. White building, in the heart of Columbus, was bequeathed to the University by Mr. White in 1922, and \$250,000 was given for the purchase and maintenance of a 61-inch reflecting telescope. In 1922 the University began a campaign to raise \$8,000,000 to add to the endowment and to provide funds for 16 new buildings. The productive endowment amounted to \$2,048,922 and the income to \$607,344, in 1928. President, Edmund D. Soper, B.A., B.D., D.D., LL.D.

OIL. See PETROLEUM.

OIL ENGINE. See INTERNAL-COMBUSTION ENGINES, MOTOR VEHICLES.

OIL SCANDALS. See UNITED STATES, under History PETROLEUM.

OKLAHOMA. The seventeenth State in size (70,057 square miles) and the twenty-first in population; capital, Oklahoma City. The population increased from 1,657,155 in 1910 to 2,028,283 in 1920, a gain of 22.4 per cent; estimated population, 1928, 2,426,000. Whites increased in number from 1,444,531 (1910) to 1,821,194 (1920); Negroes, from 137,612 to 149,408, native whites from 1,404,447 to 1,781,226. The Indian population decreased from 74,825 to 57,337; foreign-born white, from 40,084 to 39,968. Urban population increased from 320,155 to 539,480; rural, from 1,337,000 to 1,488,803. The growth of the principal cities was as follows: Oklahoma City (q.v.), from 64,205 in 1910 to 91,295 in 1920, Tulsa (q.v.), 18,182 to 72,075; Muskogee, 25,278 to 30,277.

Agriculture. As Oklahoma is an important grain-producing State, agricultural conditions have reflected the fluctuations of price and production which characterized the war and post-war conditions. The general situation is discussed under AGRICULTURE, CORN, WHEAT, etc. Oklahoma is an important producer of cotton, and the damage and uncertainty caused by the invasion of the boll weevil was considerable in some years. The fluctuations of the cotton crop in late years are indicated by the following figures: 1913, 3,009,000 acres, production, 840,000 bales; 1920, 2,749,000 and 1,336,000; 1921, 2,206,000 and 481,000; 1922, 2,951,000 and 635,000; 1928 (estimated), 4,249,000 and 1,180,000.

The number of farms, which had increased 0.9 per cent from 1910 to 1920, rose from 191,988 in 1920 to 197,218 in 1925, or by 2.7 per cent. The total area of land in farms, however, decreased from 31,951,934 acres in 1920 to 3,868,965 in 1925. The improved land in farms totaled 18,125,321 in 1920. The percentage of the total area in farm land decreased from 71.9 in 1920 to 69.5 in 1925. The total value of farm property rose from \$918,198,882 in 1910 to \$1,660,423,544 in 1920, or 80.8 per cent, but declined to \$1,210,134,914 in 1925; the average value per farm was \$4828 in 1910, \$8649 in 1920, and \$6136 in 1925. Of the total number of farms in 1925, 81,226 were operated by owners; 494, by managers; and 115,498, by tenants. The corresponding figures for 1910 were 85,404; 651; and 104,137. White farmers numbered 173,263 in 1920; 169,521 in 1910. Colored farmers numbered 18,725 in 1920; 20,671 in 1910. Farms reported as under mortgage, 47,025 in 1920, numbered 39,263 in

1925. The total number of cattle was 2,073,945 in 1920; 1,656,763 in 1925. Dairy cows numbered 808,459 in 1920; 360,297 in 1925. Sheep numbered 105,370 in 1920; 62,108 in 1925. The number of swine decreased notably from 1,304,094 in 1920 to 920,059 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 70,150,000 bushels; wheat, 59,576,000; oats, 23,140,000; grain sorghum, 30,762,000; potatoes, 5,040,000; sweet potatoes, 1,780,000; hay, 1,333,000 tons. Comparative figures for 1913 are corn, 52,250,000 bushels; wheat, 17,500,000; oats, 18,540,000; potatoes, 1,920,000; and hay, 382,000 tons.

Mining. Oklahoma, although its metal output is secondary, ranked second in 1926, among the States, in value of mineral production. This was due chiefly to the development of the petroleum fields in the State during recent years. The production of petroleum in 1914 was 73,631,724 barrels; (1915) 97,915,243; (1916) 107,071,715; (1917) 107,507,471; (1918) 103,347,070, (1920) 106,206,000; (1922) 149,571,000; (1926) 179,195,000. The production of natural gas kept pace with the development of the petroleum fields, the production in 1914 being 78,167,414 M cubic feet; (1916) 123,517,358; (1918) 124,317,179; (1920) 154,467,200; (1926) 286,421,000. The production of natural-gas gasoline has become extremely important in recent years; 178,856,929 gallons were produced in 1920 and 475,716,000 gallons in 1926. The coal production formerly exceeded 4,000,000 tons annually; it was 3,988,613 tons in 1914, 4,813,447 in 1918; and 2,842,673 in 1926. In addition to the minerals mentioned, the State produces cement, gypsum, lead, stone, and large quantities of zinc. The total value of the mineral production of the State in 1926 was \$569,518,693, compared with \$493,320,359 in 1920, \$291,078,174 in 1919; \$336,857,921 in 1918, and \$78,744,447 in 1914.

Manufactures. Oklahoma is not one of the leading industrial States, but its manufacturing activities have shown great increase in value of products and in number of persons employed in recent years. In 1920 there were 12 cities with 10,000 inhabitants or more, which contained 15.6 per cent of the total population of the State, and in 1919 reported 33.3 per cent of the value of the State's manufactured products. There were 2310 manufacturing establishments in the State in 1909; 1274 in 1925, and 1373 in 1927. Persons engaged in manufactories numbered 18,034, 38,314, 26,163, and 27,932, respectively; capital invested amounted to \$38,872,938 in 1909 and \$277,034,318 in 1919. The value of manufactured products in 1909 was \$53,682,405; in 1919, \$401,362,869; in 1925, \$400,291,825; and in 1927, \$371,718,409. The large increase in value of products occurring about 1919, was chiefly due to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period, but simultaneous increase in the number of wage earners clearly indicated the augmented manufacturing activities. Petroleum-refining is the most important industry in point of value of product. This amounted to \$1,055,000 in 1909; \$13,014,000 in 1914; and \$150,673,000 in 1919. Flour-mill and gristmill products rank second in this respect, with a value, in 1909, of \$19,144,000; 1919, \$49,844,000; and 1925, \$25,880,940. The smelting and refining of zinc, in third place, had a product, in

1909, valued at \$3,002,000; 1914, \$9,939,000; and 1919, \$19,518,000. The manufacture of cottonseed oil and cake was fourth: valued in 1909 at \$5,187,000; in 1919, \$18,907,000; and in 1927, at \$18,448,000. The chief manufacturing cities are Oklahoma City and Tulsa. In Oklahoma City, there were 171 manufacturing establishments in 1909, with a product valued at \$7,868,000; 195 in 1914, with \$2,726,000; and 227 in 1919, with \$69,971,000. Tulsa had 53 establishments in 1909, with a product valued at \$1,563,000; 103 in 1914, with \$3,868,000; and 135 in 1919, with \$14,050,000. Other important manufacturing cities are Enid, Muskogee, Guthrie, and McAlester.

Education. The development of schools has proceeded amid complications of rapid rise in population and economic status. A remarkable growth in the wealth and population of the State has made possible better schools. The average length of the school term rose from 140 session days in 1909-10 to 166.4 days in 1919-20; in 1925-26 it was 148.9 days. The normal schools, long insufficient, were increased by the provision for normal training in certain selected high schools. There was a large increase in the number of schools offering high-school courses, and high-school opportunities to rural children were greatly extended by the organization of graded and consolidated districts. A large colored and Indian population greatly increased the educational difficulties of the State. The enrollment in the public schools increased from 496,908 in 1914 to 648,946 in 1925-26. The enrollment in white rural schools in 1920 was 544,821, and in colored rural schools, 44,401. In elementary rural schools for white pupils, there were enrolled 517,317 in 1921, in white high schools, 47,893; in Negro elementary schools, 42,938, and in Negro high schools, 1619. The expenditure for public day schools in 1925-26 was current, \$27,259,158; outlays, \$1,740,071. Public-school enrollment was 648,946; that in elementary grades, 565,884; in high schools, 83,062. The percentage of illiteracy in the State decreased from 6.9 in 1910 to 4.7 in 1920: in the native white population, from 4.2 to 2.9 per cent; rose in foreign-born white, from 9.7 to 13.4, fell in Negro, from 22.7 to 16.4.

Finance. State expenditures in the year ended June 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$17,250,096 (of which \$3,185,197 was aid to local education); for interest on debt, \$124,931; for permanent improvements, \$10,763,728; total, \$28,138,755 (of which \$11,472,649 was for highways, \$2,090,358 being for maintenance and \$9,382,282 for construction). Revenues were \$31,676,172. Of this, property and special taxes formed 9.8 per cent; departmental earnings and charge for officials' services, 7.0 per cent; sales of licenses and taxation of gasoline, 51.5 per cent. Property valuation was \$1,697,367,213; State taxation thereon, \$848,684. Net State funded debt was, June 30, 1927, \$3,074,803.

Political and Other Events. At elections held for governor and United States Senator in 1914, Senator Gore was reelected and R. L. Williams, the Democratic candidate, was elected governor. On Jan. 21, 1915, the United States Supreme Court declared unconstitutional the so-called "grandfather clause" to the constitution, which disfranchised a large percentage of the Negroes of the State. For President, in 1916

Wilson received 148,626 votes; Hughes, 98,299. In 1918 Senator Owen was reelected by the Democrats, and Judge J. B. A. Robertson, Democrat, was elected governor. In 1920, for United States Senator, John W. Harrold, Republican, defeated Scott Ferris, Democrat, by a large majority. In the presidential voting of this year, Harding received 243,415 votes; Cox, 215,521. An attempt was made in April, 1921, to impeach Gov. J. B. A. Robertson. This failed in the Legislature. On Mar. 22, 1922, Governor Robertson was arrested for bribery in connection with the insolvency of the Guarantee State Bank of Okmulgee. In 1922 J. C. Walton, Democratic candidate, was elected governor. In the summer of 1923, as a result of alleged outrages by the Ku Klux Klan, Governor Walton placed the State under martial law. The Legislature denied his right to do this and sought to hold a special session in order to impeach him. Governor Walton denied their right to meet, and the members of the Legislature circulated a petition among themselves for a special session. The adjutant general of the State was ordered by the Governor to prevent their meeting, but the legislators entered the Capitol without hindrance, although they were prevented from assembling by an officer of the National Guard. Previous to these events, Governor Walton had called a special election to pass on proposed amendments to the State constitution. One of these would permit the Legislature to assemble without the Governor's consent on a call of a majority of its members. The attorney general attempted to have ballots for this measure cast by the Supreme Court, but the petition was denied. The Governor thereupon sought to prevent the election. It was held nevertheless, and the amendment was passed. Governor Walton then ordered the Legislature to meet but specified that it should devote its attention exclusively to the Ku Klux Klan. On assembling, the House filed charges with the Senate acting as a court of impeachment. In November, Governor Walton was found guilty on 11 counts, including charges that he had padded the State payroll, prevented the assembling of the Grand Jury, attempted to prevent a special State election, exceeded the legal limit of election expenses, and was generally incompetent. The Governor presented no defense. He was succeeded by the lieutenant governor. In 1927 a political feud led to a similar effort to remove Governor Henry S. Johnston. He was successful in having the acts of a self-convened special session declared null in the courts; but in 1929 the regular session of the Lower House impeached him on numerous counts and he was removed. In 1924 the presidential vote of the State was: Davis, 255,798, Coolidge, 226,242; LaFollette, 41,141. M. E. Trapp, succeeded as governor in 1924; in 1926 H. S. Johnston, Democrat, was elected. In 1928 the vote for President was strongly adverse to the Democratic candidate; it was: Hoover, 394,052; Smith, 219,206.

Legislation. A budget system was created by the Legislature of 1919. At this session also measures were passed defining and punishing criminal syndicalism and sabotage. In 1923 the Legislature passed a measure providing for industrial rehabilitation and farm or home aid for veterans of the War. A measure also was passed making robbery or its attempt punishable by a minimum of 25 years in prison. The Legislature also passed a bill prohibiting the

Ku Klux Klan and members of other organizations from wearing masks in public. A measure permitting natural gas to be piped out of the State was passed in 1927.

OKLAHOMA, UNIVERSITY OF. A State institution for the higher education of men and women at Norman, founded in 1892. The student enrollment increased rapidly between 1914 and the autumn of 1928, from 1700 in the former year to 4915 in the latter, with an additional registration in the summer session of 1928 of 2373. The faculty was increased in the same period from 135 to 333, and the library from 23,000 to 100,000 volumes. The income increased from \$253,000 in 1916 to \$2,328,535 in 1927-28, the productive funds in 1928 amounting to \$3,200,000. The school of social service was established, and the department of manual training in the college of engineering opened in 1917; special war courses were offered in 1918; and the school of public and private business was organized in 1923 as a separate school with authority to grant the B.S. degree. Up to that time, the B.A. degree with special certificate in public and private business had been conferred in the college of arts and sciences. An auditorium, a fine arts building, a library building, a geology building, a hospital, and an armory were erected in 1920, and a women's building in the following year. Two new buildings, engineering and medical, were under construction in 1924, and four, including one for classrooms, two dormitories, and a gymnasium, in 1925. Stratton D. Brooks was president during the period under review until 1923, when J. S. Buchanan became acting president and was followed as president by William Bennett Bizzell, Ph.D., LL.D., in 1925.

OKLAHOMA CITY. The capital and commercial centre of Oklahoma. The population increased from 64,205 in 1910 to 91,295 in 1920 and to 177,000 in 1928, according to local estimate. In 1927 the city-manager form of government was adopted. The city ranks as one of the leading seven live-stock markets in the United States, it is also the home of the Oklahoma State Fair and of the Southwest American Live-stock Show, which are held annually. During 1914 to 1924, a \$5,500,000 water system and a \$1,000,000 power plant were constructed. An important school-building programme also was carried out, increasing the value of the schools from \$2,456,000 to \$8,494,000. In 1928, 543 manufacturing plants were located in Oklahoma City; the value of their output was \$195,000,000. On Nov. 29, 1927, bond issues totaling \$10,329,000 were voted for public improvements, including increased water supplies, acquisition of railroad properties for the construction of a civic centre, bridge and river improvements, construction and extension of sewers, and additional school buildings. In 1929 an agreement was reached between the city authorities and the four principal railways (Santa Fe, Saint Louis-San Francisco, Rock Island, and Missouri-Kansas-Texas) for the relocation and elevation of tracks and the construction of a union station costing \$2,000,000. The value of building permits in 1927 was \$10,621,206 and of bank clearings in 1928, \$1,568,022,000. The assessed valuation of property in 1928 was \$121,975,196; the net debt amounted to \$21,615,537.

OLCZEWSKA, MARIA (1892-). Stage-name of Maria Berchtenbreiter, a German dramatic mezzo-soprano, born at Augsburg. She began her career as a singer in operetta, then

sang at the opera in Leipzig (1920-23), and in 1925 became a member of the Staatsoper in Vienna, being heard frequently as guest at important German opera houses. She made her American debut with the Chicago Opera Company in the title rôle of *Carmen* (Oct. 31, 1928). Her interpretations of Wagner have won the highest praise.

OLD-AGE PENSIONS, IN THE UNITED STATES. The United States has been slow in adopting old-age pensions. The proportion of aged persons in its population was considerably smaller than in some of the older countries; and its largely agricultural population did not show the evils of indigent old age so quickly as those of more thickly populated areas. Up to 1913, practically the only measures that had been taken to relieve the hardships of the old age of workmen were those of railroads and large industrial concerns, which provided for the retirement with pension of their own employees, usually at the age of 65. In most cases, no contributions from the beneficiaries were required.

The trade unions objected to this method of provision. The employer admitted no legal claim to a pension and retained the right to withdraw the pension offer if an employee was guilty of misconduct, which discouraged strikes and tied the worker's hands. Old-age insurance was offered by a very few trade unions and a few fraternal organizations. The pensioning of municipal, State, and Federal employees, though growing, was still quite limited. Retirement funds for teachers, policemen, and firemen, however, were becoming common. Some provision for old-age insurance through savings banks had been made in Massachusetts in 1908 and in Wisconsin in 1911, but the only comprehensive system was that of military and naval pensions; and in not one of the public measures was the lower-paid and most needy class of workers provided for.

In 1920 Congress passed a bill providing for the retirement of employees in the Civil Service, under which contributions by employees to the extent of 2½ per cent of their basic compensation, and retirement at 70 after 15 years of service, were compulsory, and old-age and total-disability pensions were granted in ratio to contribution and length of service. Beyond the unsuccessful launching of the Old-age Pension Bill in Ohio in 1917, nothing had been accomplished up to this time in the way of old-age pensions proper; but interest had by no means been dormant. In 1921-22 it gained impetus; labor organizations, church bodies, and industrial leaders took up the cry; in that year, old-age pension acts, of varying nature, were introduced in 15 State legislatures and in Congress. Definite results came in 1923, when State laws for old-age assistance were passed in Montana, Nevada, and Pennsylvania.

The Nevada law required that applicants be at least 60 years of age, citizens of the United States for at least 15 years, and residents of the State for at least 10 years. The income of beneficiaries from pension and all other sources was not to exceed \$1 per day. Those who had children capable of and responsible for support, also those who owned property exceeding \$3000, were excluded. This act was repealed, however, in 1925 and another substituted in the same year which made the pensioning of aged persons voluntary. Decisions were to rest with the

county commissioners, and the age limit was raised from 60 to 65 years. The act in 1929 was not being enforced.

The Montana law, like the amended Nevada code, placed the supervision of the act in the hands of county commissioners. Pensioners were to be 70 years old with incomes below \$300 a year. Pensioners had to be citizens of the United States for 15 years and residents of the State for the same length of time. The maximum pension was fixed at \$25 a month. At the end of 1926, 37 of the 56 counties were paying pensions to 448 persons. The cost of the pensions was \$16 07 monthly on the average. The Pennsylvania law was similar to the Montana statute except that it fixed the pension at \$1 per day. The law was to be administered for the State by a State commission and, in the counties, local boards were to be responsible for the enforcement of the act. The law was immediately contested in the courts and in 1924 the Dauphin County Court found the act unconstitutional. The next year, the State Supreme Court, on the ground that the act provided for legislative appropriations for charitable purposes, affirmed the decision of the lower court. Wisconsin passed a law similar to the Montana act in 1925 and placed administration in the hands of the counties. In 1927, when the law was in operation in four counties, 295 persons were being supported on pension rolls, at an annual expenditure of \$50,000. The average pension amounted to \$19 20 per month. By 1929 two other counties had adopted the system. In 1926 Kentucky passed a similar law, placing administration in the hands of county authorities. By 1929 none of the counties had seen fit to inaugurate the system. In 1927 Colorado and Maryland passed laws like the Wisconsin and Montana statutes, but by 1929 no action had yet been taken by any of the counties. Alaska passed a law in 1915 (amended 1923) giving to any pioneer, who had reached the age of 65 and had resided in the territory for 15 years or more since 1905, a monthly pension of \$25 for men and \$45 for women.

Massachusetts sought to cope with the problem of dependent old age by passing a law in 1908 authorizing savings banks to sell life-insurance and annuity policies; but at the end of 1927, the number of annuity contracts in force was only 513. The 1928 Legislature of this State created the Public Bequest Commission that was authorized to receive donations for the pensioning of aged persons. Disbursements from the fund were to be made from income only after the principal had reached \$500,000.

With the year 1928, largely as a result of the formation of the American Association for Old Age Security, agitation for the pensioning of aged persons took on a new impetus in the United States. As a result of the increase in longevity, with a declining birthrate, and because the mechanization of industry was placing constantly a greater premium on youth, it was becoming apparent that the care of aged dependent persons was one of the chief social problems before the American people. It was being estimated that at least 1,800,000 persons over 65 (or two out of every five) were destitute or had to depend upon relatives, friends, or public and private charitable relief. As a result of this movement, the year 1929 saw a great variety of old-age pension bills being introduced in the State legislatures. In Arkansas, California,

Connecticut, Delaware, Idaho, Illinois, Indiana, Maryland, Massachusetts, Michigan, Minnesota, New Jersey, New York, Oklahoma, Ohio, Oregon, Pennsylvania, Texas, Utah, Washington, and Wyoming, such bills had been introduced. It was expected that at least Oklahoma and Minnesota would pass laws. In the latter State, the Senate had approved the standard bill by a vote of 61 to 1.

Other Countries. The movement for old-age protection was not more than 25 years old, yet the year 1929 saw more than one-third of the entire population of the world and more than half the civilized nations with one kind or another of governmental systems of old-age security. China, India, and the United States alone were the only large countries without some programme for the care of superannuated wage-earners. At least 39 foreign countries had passed legislation for the protection of all or certain classes of their aged populations. In 26 of these, the pension schemes were based on the contributory basis; in 12, the scheme was non-contributory (as in those States of the United States where laws were already in operation); in 1, the scheme was an exclusive voluntary insurance scheme. In most countries, the pensionable age ranged from 60 to 65; 5 nations retired their male pensioners at 70; 1 (Newfoundland) paid pensions to males at 75.

The following countries had compulsory contributory old-age pension laws: Austria, Belgium, Bolivia (for postal and telegraph employees only), Brazil (railroad employees only), Bulgaria, Chile, Cuba (railroad employees only), Czechoslovakia, France, Germany, Great Britain, Greece, Ireland (certain classes only), Italy, Luxemburg, the Netherlands, Poland (salaried workers only), Portugal, Rumania, Russia, Yugoslavia, Hungary, Spain, Sweden, Switzerland, Uruguay. In the following countries, the State, as well as the employers and the workers, make contributions to the funds. Belgium, Brazil, Bulgaria, Chile, Czechoslovakia, France, Germany, Great Britain, Italy, Luxemburg, the Netherlands, Iceland, Portugal, Rumania, Yugoslavia, Hungary, Spain, Switzerland. In the following countries, the State paid the pensions: Australia, Canada, Cordoba (Argentina), Denmark, Finland, Greenland, Irish Free State, Guernsey, Mendoza (Argentina), New Zealand, Norway, Newfoundland, South Africa.

In Canada, where the Dominion government matched the contributions of the provinces (similar to the American system of Federal grants-in-aid), the following provinces by 1929 already had pension schemes in operation: British Columbia, Saskatchewan, Manitoba, Yukon, Alberta, and Ontario. In Japan, the voluntary insurance scheme prevailed. See SOCIAL INSURANCE.

Bibliography. An outstanding book on the subject of old-age pensions is the *Challenge of the Aged*, by Abraham Epstein (New York, 1928). The author whose previous work, *Facing Old Age* (New York, 1922), had attracted attention, was the secretary of the American Association for Old-Age Security and credit for the intelligent campaign being waged in the United States after 1928 must go largely to him, and his enlightened board of directors. It is significant to note that organized philanthropy made no effort to aid the movement.

OLDS, ROBERT EDWIN (1875-). An American lawyer and Under-Secretary of State. He was born at Duluth, Minn., and was graduated

from Harvard (*summa cum laude*, 1897, and LL.B., 1900). He practiced law at St. Paul until 1917. During the World War and until 1921, he was in the service of the American Red Cross in Europe. In 1923-25 he was American member of the Arbitration Tribunal to adjust claims between the United States and Great Britain under the treaty of 1910; and in 1924-25 he was a member of the League of Nations commission to report a plan in international cooperation for disaster relief. He was appointed Assistant Secretary of State in 1925, and Under-Secretary of State in 1927, resigning in 1928. In 1925 he supervised the negotiations of the United States with Mexico in regard to alien land and petroleum legislation. In 1929 he was appointed by the Reparations Commission as its American citizen member.

OLIVER, SIR THOMAS (1853-). A British physician born in Ayrshire, Scotland, identified especially with occupational hygiene and the prevention and treatment of occupational diseases. Educated at Glasgow University, he practiced at Newcastle on Tyne, and was successively professor of physiology and of the practice of medicine and president of the Durham College of Medicine. His book, *Diseases of Occupation*, was published in 1908 and in the same year he was knighted. His monograph, *Lead Poisoning*, appeared in 1914. Since 1902 he has edited the publication, *Dangerous Trades*, and for many years he was the medical expert to the Dangerous Trades Commission. He has contributed the articles on occupational disease to numerous standard reference works and has received many honors from governments and societies, for his services in this field.

OLMSTED, FREDERICK LAW (1870-). An American landscape architect (see Vol. XVII). From 1902 to 1917, he was landscape architect for the Baltimore Park Commission and after 1908, landscape architect for the Sage Foundation Homes Company, Forest Hills, L. I. He was professor of landscape architecture at Harvard University, 1903-14, a member of the National Commission of Fine Arts, and chairman of the Executive Committee of the National Conference on City Planning from 1910 to 1919, and governor of the American City Planning Institute. In 1917-18 he was a member of the Commission on Emergency Construction of the War Industries Board and during the same period, manager of the town-planning division of the United States Housing Corporation. Since 1926 he has been a member of the National Capital Park and Planning Commission.

OLYMPIC GAMES. The modern revival of the Olympic Games which played such a picturesque part in the history of ancient athletic Greece was due to the indefatigable efforts of one man, Baron Pierre de Coubertin, of France. Baron de Coubertin launched his campaign in 1892 with a colorful description of the classic Olympiads which he distributed among the leading press associations of the world. For a long time the lack of response to this appeal was most discouraging, but first the United States and then Great Britain expressed their desire to cooperate and eventually the Baron's goal was attained in 1896 when the first modern Olympics were held, in a most appropriate setting, at Athens, Greece. Since that date, the Olympics have been staged every four years with the exception of the period of the World War, 1912-20, at the following places: Paris (1900), St. Louis (1904), Athens (special, 1906), London

(1908), Stockholm (1912), Antwerp (1920), Paris (1924), Amsterdam (1928). The Olympiad for 1932 has been arranged for at Los Angeles.

The athletes of the United States were invariably returned the winners in each Olympiad until that of 1928, when their supremacy was seriously disputed by the German contestants. The United States retained its laurels in track and field contests and swimming, but the official check-up of the results in all branches of competition revealed that the Germans had secured a total of 45½ points, as against the United States' 39.

The growth in popularity of the Olympics throughout the whole world can be traced by the steady increase in the number of countries represented in the various Olympiads. From a mere handful of nations as participants in those first games at Athens, the 1928 Olympics found 33 different countries contesting. The 1928 revival also was noteworthy as marking the first time that women had held their competitions in conjunction with the men.

A comprehensive survey of the outstanding achievements in the various Olympiads, together with a comparison of the winning standards set in the several events, would be of much interest but would require more space than is available. It is only possible to point out a few striking illustrations of the progress attained. In 1896, for example, T. E. Burke, United States, captured the popular 100-meter-dash event in 12 seconds; whereas, four years later, F. W. Jarvis, United States, ran the distance in 10½ seconds, this time being equaled in 1908, 1912, 1920, and 1928. E. H. Flack, Great Britain, covered 800 meters in 2 minutes, 11 seconds in 1896, but D. A. G. Lowe, Great Britain, lowered this to 1 minute, 51½ seconds in 1928. More interesting still is the statistical history of the 1500-meter run. In 1896 Flack, Great Britain, sped this stretch in 4 minutes, 33½ seconds, whereas, in 1928 H. E. Larva, Finland, covered the same ground in 3 minutes, 53½ seconds, clipping the old time by almost a minute.

The one Olympic event which perhaps has a wider appeal than any other is the Marathon, the thrill and tragedy afforded by the historic story of that first runner, Philipides, leaving its deep impress upon each succeeding generation of sports lovers. Fittingly enough, the winner of the first modern Marathon in 1896 was S. Loues, a Greek, whose time for the 26 miles, 385 yards was 2 hours, 55 minutes, 20 seconds. By another variety of fate, the victor in the 1928 Marathon was El Ouafi, from Algiers, just across the Mediterranean from the shores of Greece. El Ouafi, who ran under the colors of France, negotiated the distance in 2 hours, 32 minutes, 57 seconds, the second-best time ever made in this event. A throng of 40,000 packed the Amsterdam stadium to acclaim the triumphant finish of El Ouafi.

Reference has been made to the amazing progress made in establishing new records at the various Olympic Games and it would seem essential to enumerate here the standards officially accepted for track and field events.

Five men hold jointly the record for the 100-meter dash—10.6 seconds. They are D. F. Lippincott (U. S., 1912), H. M. Abrahams (Great Britain, 1924), Percy Williams (Canada, 1928), R. F. McAllister (U. S., 1928), J. E. London (Great Britain, 1928).

The 200-meter-run record of 21.6 seconds, set by A. Hahn (U. S.) at St. Louis in 1904, stood

for twenty years, or until J. V. Scholz (U. S.) tied it at Paris in 1924. Herman Kornig (Germany) accomplished the same time at Amsterdam in 1928.

The holders of other important records follow: 400-meter run, 47.6 seconds, E. H. Liddell (Great Britain), Paris, 1924; 800-meter run, 1 minute, 51½ seconds, D. G. A. Lowe (Great Britain), Amsterdam, 1928; 1500-meter run, 3 minutes, 53½ seconds, H. E. Larva (Finland), Amsterdam, 1928; 5000-meter run, 14 minutes, 31.2 seconds, Paavo Nurmi (Finland), Paris, 1924; 10,000-meter run, 30 minutes, 18½ seconds, Paavo Nurmi (Finland), Amsterdam, 1928; 10,000-meter walk, 46 minutes, 28.4 seconds, G. H. Goulding (Canada), Stockholm, 1912; 110-meter hurdles, 14½ seconds, Weightman-Smith (So. Africa), Amsterdam, 1928; 400-meter hurdles, 52½ seconds, Lord Burghley (Great Britain) and F. M. Taylor (U. S.), Amsterdam, 1928; running high jump, 6 feet, 6 inches, H. M. Osborn (U. S.), Paris, 1924; running broad jump, Edward B. Hamm (U. S.), 25 feet, 4¾ inches, Amsterdam, 1928; hop, step, and jump, 50 feet, 11¼ inches, A. W. Winter (Australia), Paris, 1924; pole vault, 13 feet, 9¾ inches, Sabin W. Carr (U. S.), Amsterdam, 1928; discus throw, 155 feet, 21½ inches, C. L. Houser (U. S.), Amsterdam, 1928; javelin throw, 218 feet, 6¾ inches, E. H. Lundquist (Sweden), Amsterdam, 1928; 16-pound shot, 52 feet, 1¼ inch, John Kuck (U. S.), Amsterdam, 1928; 16-pound hammer, 179 feet, 8.4 inches, M. J. McGrath (U. S.), Stockholm, 1912; 56-pound weight, 36 feet, 11½ inches, P. J. McDonald (U. S.), Antwerp, 1920; pentathlon, 14 points, E. R. Lehtonen (Finland), Antwerp, 1920; decathlon, 8053.290 points, Paavo Yrjola (Finland), Amsterdam, 1928.

Aside from the United States and Germany, other nations to score points in the leading events at the Amsterdam Olympics were: Holland, 34½; Italy, 33½; Sweden, 32½; Finland, 25; Great Britain, 18; France, 16; Argentina, 12½.

The women's track-and-field competitions at Amsterdam resulted in a triumph for Canada, with the United States second and Germany third. The winter sports were won by Norway, the United States being second and Sweden third. In lacrosse, a triple tie existed among the United States, Canada, and Great Britain.

The team records in the 1928 Olympic contests were.

Track and field—United States, first; Finland, second, Great Britain, third, Germany, fourth, Sweden, fifth, Canada, sixth.

Rowing—United States, first, Great Britain, second, Switzerland, third, Italy, fourth, Germany, fifth; Australia, sixth.

Swimming—United States, first; Germany, second; Great Britain, third; Sweden and Holland, tied for fourth, Japan, sixth.

Boxing—Argentina and Italy, tied for first; United States, third, Holland, fourth; Sweden, fifth, New Zealand and Hungary, tied for sixth.

Catch-as-catch-can wrestling—Finland, first, Sweden, second; Switzerland, third, United States, fourth; Canada, fifth.

Greco-Roman wrestling—Germany, first, Finland, second, Switzerland, third, Hungary, fourth; Estonia, fifth, Egypt, sixth.

Fencing—Italy, first; France, second; Hungary, third, Germany, fourth; United States, fifth; Argentina, sixth.

Gymnastics—Switzerland, first; Czechoslovakia, second, Yugoslavia, third, France, fourth, Finland, fifth; Italy, sixth.

Yachting—Norway first, Sweden, second; Denmark, third; Holland, fourth, Estonia, fifth; Finland, sixth.

Cycling—Holland, first, Denmark, second, Great Britain, third, France, fourth; Italy, fifth.

Modern pentathlon—Sweden, first; Germany, second, Holland, third; Italy, fourth, Finland, fifth; Great Britain, sixth.

Equestrian sports—Holland and Poland, tied for first; Germany and Spain, tied for third; Sweden, fifth; Norway, sixth.

Soccer—Uruguay, first; Argentina, second; Italy, third; Spain, fourth.

Field hockey—British India, first; Holland, second, Germany, third; Belgium, fourth.

Weight lifting—Germany, first; France, second, Austria, third; Italy, fourth, Egypt, fifth, Estonia, sixth.

OMAHA. The largest city of Nebraska. The population rose from 156,231 in 1910 to 191,601 in 1920 and to 222,800, in 1928, by estimate of the U. S. Bureau of the Census. A comprehensive zoning ordinance was adopted in 1920. In the same year, the Metropolitan Utilities District, controlling the city-owned gas and water systems, was organized with plant equipment valued at \$13,000,000. In 1928 the city had 520 miles of water mains and 460 miles of gas mains, of the 1100 miles of streets, 457 miles were paved. The school-building programme since 1923 has included the erection of the new Technical High School at a cost of \$3,500,000; the North High School at a cost of \$750,000; the Benson High School at a cost of \$700,000; and a \$718,000 addition to the South High School. The construction of elementary schools and improvements represent an expenditure of \$5,000,000. Omaha holds second place among the live-stock markets of the United States. Its 14 meat-packing plants consume about 65 per cent of the butcher stock received; the output of meats and other packing-house products is valued at approximately \$200,000,000 a year. The Live Stock Exchange costing \$1,000,000 and a \$750,000 traffic viaduct have been constructed; facilities for receiving motor-truck shipments of live stock, which total nearly 2,000,000 head annually, also have been improved. The Omaha municipal airport, comprising 200 acres, is the central airport on the New York-San Francisco air route and a terminus on the Omaha-Kansas City route. On Nov. 6, 1928, the city voted bonds amounting to \$250,000 for the improvement of the facilities of the field. Building construction has been active. Among the structures erected since 1924 are the Omaha Bee-News Building, Union State Bank Building, Medical Arts Building, Jewish Community Centre, Ak-Sar-Ben Coliseum, Knights of Columbus Home, and the Paxton Hotel. In 1928 the Joslyn Memorial Building, a \$3,000,000 headquarters for musical, art, and cultural organizations, and the Union Bus Depot were under construction. An agreement was reached in 1929 for the combination of the two separate but adjacent passenger terminals of the Union Pacific and Chicago, Burlington & Quincy railways as a joint terminal to cost \$4,200,000. In 1925, 15,463 persons were employed in the city's industrial establishments and received \$21,048,000 in wages; the value of products manufactured was \$339,004,000. Bank clearings in 1928 amounted to \$2,311,913,000. The assessed valuation of property in 1927 was \$342,322,000; the net debt was \$33,231,000.

OMAN. See ARABIA.

ONCKEN, önk'en, HERMANN (1869-). A German historian and professor at the University of Berlin (since 1928). He contributed largely to the World War literature of his country. Among his works are *Amerika und die grossen Mächte: Historisch-politische Aufsätze* (1914); *Das alte und das neue Mitteleuropa* (1917); *Ueber den Zusammenhang von innerer und Aeusserer Politik* (1918); *Weltgeschichte*

und Versailler Friede (1921); *Die Utopie des Thomas Morcs und das Machtproblem in der Staatslehre* (1921); *Staatenation und Kulturation* (1922); *Lassalle* (1922); *Die historische Rheinpolitik der Franzosen* (1922); *Aus Rankes Fruhzeit* (1922); *Die Rheinpolitik Kaiser Napoleons III, 1865-71, und der Ursprung des Krieges, 1870-71* (1926).

O'NEILL, EUGENE (GLADSTONE) (1888-). An American playwright, born in New York City, the son of James O'Neill, a celebrated actor. He was educated at De La Salle Institute and Princeton (1900-07) and Harvard (1914-15) universities. In 1909 he went to San Francisco and thence to Central America on a gold-prospecting venture. After 1914, devoting himself to playwriting, he produced *The Moon of the Caribbees* and *Other Plays of the Sea* (1919); *Beyond the Horizon*, a tragedy in six acts (1919); *Thirst and Other Plays* (1914); *Emperor Jones*, an extraordinary monologue depicting the psychology of fear; *Diff'rent* (1921); *The Straw* (1921); *Gold* (1921); *Anna Christie* (1922); *The First Man and The Hairy Ape* (1922); *The Fountain* (1923); *Welded and All God's Chillun's Got Wings* (1924); *Desire Under the Elms* (1924); *Marco Millions* (1924); *The Great God Brown* (1925); *Lazarus Laughed* (1926); *The Strange Interlude* (1927); *Dynamo* (1928). He is among the outstanding American dramatists. Some of his plays have been produced in Europe. Consult *Studies on Six Plays of Eugene O'Neill*, by Alan D. Mickle (1929).

O'NEILL, NORMAN (1875-). A British composer and conductor, born in London. After studying with Dr. A. Somerwell during 1890-93, he went to Frankfurt, completing his studies at Hoch's Conservatory under I. Knorr in 1897. In 1908 he became musical director of the Haymarket Theatre, in London, which post he has held since then, with the interruption of one season at the St. James Theatre (1919-20). In 1919 he was elected treasurer of the Royal Philharmonic Society, and in 1924 joined the staff of the Royal Academy of Music as professor of composition. As a composer, he is best known for the excellent quality of his incidental music to many plays, including *Hamlet*; *Macbeth*; *King Lear*; *Julius Caesar*; *The Merchant of Venice*; Maeterlinck's *Blue Bird*; and Phillips's *The Lost Hour*. He also wrote two overtures, *In Autumn* and *In Spring Time*, *Scotch Rhapsody*; a set, *Miniatures*, for small orchestra; *Woldemar*, a fantasy for soli, chorus, and orchestra; *La belle dame sans merci*, for baritone and orchestra; a piano quintet, a cello sonata, and other chamber music.

ONIEGIN, SIGRIV (1891-). A celebrated German dramatic mezzo-soprano, born of German parents in Stockholm. She was brought up in Wiesbaden, studied singing with Resz and Weiss in Frankfurt, and later with di Ranieri in Milan, and made her debut as a concert singer in Leipzig in 1912, under her maiden name, Hoffmann. The same year, she married Eugen Oniegin, a talented composer and excellent pianist, who traveled with her as her accompanist until his death in 1919. She made her debut in opera in Stuttgart, and in 1919 became a regular member of the Nationaloper in Munich. Since her American debut at the Metropolitan Opera House as Amneris (*Aida*, Nov. 22, 1922), she has been a great favorite there. In 1920 she married the Munich physician, Fritz Pentzold.

ONTARIO. A Canadian province, with an area of 407,262 square miles, of which 365,880 square miles are land area. Population in 1911, 2,527,292; in 1921, 2,933,662, or a gain of 16 per cent; estimated in 1927, 3,187,000; and in 1929, 3,271,300. In 1921 the rural population made up 41.8 per cent of the total, as compared with 47.4 per cent in 1911. The male population numbered 1,481,890; female, 1,451,772, in 1921. The leading cities, with their populations in 1926, were: Toronto, 556,691 (381,833 in 1911), Ottawa, the capital of Canada, 119,254 (87,062 in 1911); Hamilton, 114,151 in 1921 (81,969 in 1911); London, 60,959 in 1921 (46,300 in 1911).

Industry. While agriculture is the leading activity of the province, it is evident that by no means all its possibilities are yet exploited. Only 14,000,000 acres were under cultivation in 1928 and it is estimated that northern Ontario alone contains some 20,000,000 acres ready for the plow. Diversified farming, including dairying, is becoming the rule. In 1927, 10,434,401 acres were under field crops; the more important were hay and clover, 3,382,722 acres; oats, 2,689,295; wheat, 870,957; there are also considerable yields of barley, peas, corn, fodder corn, sugar beets, and other root crops. The total value was \$261,264,000 (\$106,220,000 in 1914). The growing attention accorded dairying and the meat industry is indicated in the increase of live stock. Cattle in 1927 numbered 2,714,954 and 2,601,086 in 1913; sheep in 1927 and in 1913 were 956,267 and 705,848. The number of swine in 1927 was 1,883,177. In 1927 there were 1040 creameries and factories which produced products valued at \$73,482,546 (about \$18,000,000 in 1910). Fruit culture, particularly apples, and the production of tobacco and sugar beets are rapidly spreading in the southern districts. In 1926 all agricultural products for the province were valued at \$482,481,000, the total for the Dominion being \$1,668,175,000. Farmers' organizations are widely prevalent, and many of them concern themselves seriously with the problem of coöperative marketing. Such plans for the dairymen and fruit growers receive the support of the Government. Attention also was directed by an interested agricultural ministry to the necessity of creating coöperative credit societies. Other industries yielded. Fisheries, in 1926, \$3,152,193, made up of fresh-water catches of herring, pickerel, pike, trout, and whitefish; forest products in 1926, \$32,146,671, made up of lumber, shingles, and lath. In the manufacture of pulp and the production of paper, Ontario was second to Quebec. For 1926 pulp worth \$38,008,752 was produced.

In mining activities in 1927, Ontario led all the other provinces. Figures for metallic production for 1927 were: Gold, \$33,027,000; silver, \$5,230,402; nickel, \$5,674,448; copper, \$2,832,536; total, including all others, \$62,766,450. Nonmetallic minerals, including natural gas, crude petroleum, structural materials, and clay products, yielded \$27,073,119. Grand total for 1927, \$90,283,447; for 1911, \$42,796,162. The estimate for 1928 was \$100,000,000. Under the active administration of the Hydroelectric Commission, the extension of the use of water power for energy went on. By 1929, 558 municipalities were being served. Revenues for 1926 were \$22,677,999, and costs of maintenance, etc., together with the sinking fund, \$20,343,231; this left a surplus of \$2,334,768. (Revenues for 1913

were \$2,611,918). The growth of this experiment in public ownership may be gathered from the following 1910 horse power, 750; municipalities and townships, 10; 1926: horse power used, 536,119, municipalities, etc., 249. Total assets of the commission and the municipalities, in 1913, \$11,907,826; in 1926, \$82,739,409. Many projects are under way, one of the most important is the Chippewa Canal scheme which was completed in 1925 and produces 522,790 horse power at a construction cost estimated at \$76,302,489. This plan, because of its ambitious nature, aroused discussion of a very controversial character.

In 1926 there were 9457 industrial establishments (8001 in 1910), capitalized at \$1,985,165,921, and employing 280,351 workers (238,817 in 1910). Cost of materials were \$908,044,673 and the value of the output was \$1,677,933,504 (\$579,810,225 in 1910). Leading industries are machinery, building construction, milling, packing, leather, boot and shoe production, hosiery, and rubber products.

Trade and Communications. In 1926 there were 10,870 miles of railway, as compared with 9000 in 1913. In 1925 there were 1,241,647 miles of telephone wire and 511,286 telephones in 1926. In 1926-27 exports amounted to \$514,395,535 (\$132,756,532 in 1913) and imports to \$518,815,245 (\$301,651,328 in 1913).

Government. For 1913-14 revenues and expenditures were \$11,121,382 and \$11,819,311; by 1927-28 they had become \$55,790,000 and \$55,613,000. The Dominion subsidy and receipts from lands and forests have shown no increase, but new revenues were derived from succession duties and corporation taxes. The direct liabilities of the province by 1926 had risen to \$366,629,582. Under an act of 1921, the province was empowered to enter the banking business for the carrying of savings accounts and life-insurance business. The purpose was the application of such funds toward agricultural credits. There were, in 1927-28, 7581 elementary and secondary schools attended by 725,085 pupils (518,605 pupils in 1911). The 1926 budget bore \$10,516,440 for education (\$842,278 in 1912). Total expenditures on education, provincial and local, in 1912, \$13,492,108; in 1927, \$48,602,727. The provincial university, the University of Toronto, was attended by 5480 students in 1925-26. Women were granted the ballot in 1918 and permitted to stand for the provincial Legislature. In the Dominion Parliament, the representation is House of Commons, 82; Senate, 24.

OPIE, EUGENE LINDSAY (1873-). An American pathologist (see VOL. XVII). During the World War, he served in the U. S. Army Medical Corps in France, attaining the rank of lieutenant colonel. He left Washington University in 1923 to become professor and head of the pathology department at the University of Pennsylvania and director of laboratories at the Henry Phipps Institute there. He was engaged in a study of trench fever, pneumonia, and influenza from 1917 to 1919 and of immunity and tuberculosis after 1920. In 1921 he published *Epidemic Respiratory Disease*.

OPPENHEIM, E PHILLIPS (1866-). An English author educated at the Wyggeston Grammar school, Leicester, who published his 107th novel in 1928. His novels, which are mostly stories of adventure, include *The Lighted Way* (1912), *The Kingdom of the Blind* (1917); *The*

Great Impersonation (1920); *The Great Prince Shan* (1922); *The Evil Shepherd* (1923); *The Wrath to Come* (1924); *The Golden Beast* (1926); *Miss Brown of Xyo* (1927); and *Matorni's Vineyard* (1928).

ORDNANCE. The World War—greatest of international conflicts—had a correspondingly great effect on the development of implements of war, collectively called ordnance. The ingenuity of a nation fighting for existence, with its back to the wall, is stimulated to the utmost in developing means for overcoming the common enemy.

Science, engineering, and industry united in strenuous endeavors to make more effective the nation's man power by supplementing it with every mechanical improvement over man himself. Matériel, as contrasted with personnel, became to a greater and greater extent the determining factor in warfare—but another phase of the industrial revolution characteristic of the last century. Ordnance comprises all the things the soldier fights with, as distinguished from the material things that merely provide him with a more or less comfortable existence, such as food, clothing, shoes, shelter, fuel, means of transportation, and so forth. The ordnance equipment of a modern army includes about 1200 separate and distinct types of units, which in their assembly require the manufacture of 250,000 separate and distinct components.

The infantryman requires shoulder rifles by the million; cartridges for them by the billion; light one-man automatic rifles by tens of thousands for use in tight places calling for short concerted bursts of fire; heavy machine guns by thousands for playing the continuous leaden stream of the modern machine-gun barrage; sensitive sights and rugged tripods with elevation and traverse devices to insure placing the deadly hail with safety to his own advancing lines and maximum damage to the enemy; carts to carry his machine guns and water jackets to cool them, rifle grenades and rifle attachments to throw them; explosive hand grenades for defense against enemy raiding parties and for mopping up trenches on the offensive; gas grenades for making enemy dugouts uninhabitable and Thermit grenades for fusing the breech mechanism of captured enemy cannon and machine guns, continued possession of which is doubtful; bayonets and bolos, trench knives, helmets, periscopes, range finders, etc., not to mention the "baby" 37-mm. cannon for wiping out hostile machine-gun nests and 3-inch trench mortars of simple yet most effective design.

The artilleryman requires field pieces by the thousand for divisional artillery—the "75" gun and its companion piece, the 105-mm. howitzer; heavy pieces for corps artillery—the 4.7-inch gun and its companion piece, the 155-mm. howitzer; high-powered, medium-calibre pieces for army artillery—155-mm. guns and 8-inch howitzers; 8-, 10-, 12- and 14-inch guns and 16-inch howitzers on railway mounts to reach the enemy's back area; 16-inch guns on permanent barbette emplacements for coastal defense; self-propelled caterpillar mounts for all calibres from the 75-mm. gun to the 240-mm. howitzer, capable of negotiating steep grades, accompanying its tactical unit at all speeds and ready to go into action immediately on arrival at the

firing point and depart to safer regions immediately after its mission is accomplished. For the effective use of his weapons, the artilleryman requires vast quantities of ammunition: shrapnel, high-explosive shells, and gas shells by millions of rounds, each an intricate mechanism in itself.

The aviator requires stripped machine guns speeded up to 1400 shots per minute, adjusted with inconceivable nicety to shoot between the rapidly revolving blades of his propeller; electric heaters to prevent freezing of the lubricat-

bly forward by 500-horse-power Liberty engines, crossing trench systems, shell craters and other obstacles by means of its powerful caterpillar track-laying mechanism—are needed.

Pyrotechnics are drafted into war service to obtain communication among the various elements of attacking waves, to smoke-screen daylight raids, to illuminate the immediate foreground and thereby prevent surprise night attacks, as well as to guide night-flying airmen to a safe landing on an otherwise unilluminated landing field.

ing system of his gun mechanism at high altitudes, shot counters to indicate the available amount of ammunition remaining; armor-piercing bullets for use against armored airplanes or in low-flying action against tanks, incendiary bullets to ignite the gas contents of enemy captive balloons and dirigibles; tracer bullets to assist in correcting his aim, ingenious sights to correct automatically for the relative speed and direction of his own plane and his target; airplane bombs, from the small 25-pound-fragmentation type for use against enemy troops, to the 4000-pound bomb for attack on battleships or fortified enemy positions; bomb sights to determine the proper instant for release, and release mechanisms to carry his huge instruments of destruction with safety to himself and to release them accurately in order to inflict the most damage on the enemy.

To supplement the waves of attacking infantry, light two-man tanks equipped with a single machine gun; heavy tanks equipped with 37-mm. cannon and four machine guns—urged irresist-

The cost of equipping a modern army with necessary amounts of up-to-date ordnance can be sensed from the estimates of 12½ billion dollars made for the equipment of the first five million American troops called to the colors during the War. The impetus given to ordnance design by that conflict has continued, inasmuch as the length of time in which the United States was actively in the War did not permit the full development of many promising devices. While accurate information in regard to advances in the field of ordnance design by other armies is not available, it can safely be assumed that they have made at least as much progress in this direction as a recent announcement indicates has been made in the United States Army. A general idea of the relative effectiveness of ordnance used during the War and that developed since the Armistice can be gained from the statement that in the United States Army, the new 75-mm. gun has twice the range of the French "75" used in 1918; the new 4.7-inch gun has two and one-half times the range of the pre-war model

and fires a heavier projectile; the new 155-mm. gun outranges the French gun of the same calibre used during the War, by nearly five miles; the largest aerial bomb effectively used during the War weighed only 400 pounds; the latest successful development weighs 4000 pounds and contains over a ton of explosive; the 50-calibre super-machine gun shoots a bullet weighing four times as much as the 0.30-calibre Browning and has three times the range of the weapon used in the War; the latest caterpillar mount for divisional artillery has attained a maximum speed of 30 miles on good roads, as contrasted with the 8- or 10-mile-per-hour maximum during the War. See ARTILLERY; EXPLOSIVES; GUNS, NAVAL; PROJECTILE; SMALL ARMS; TRENCH WARFARE MATERIAL; STRATEGY AND TACTICS.

ORE DEPOSITS. See GEOLOGY, under *Economic Geology*.

OREGON. The ninth State in size (96,699 square miles) and the thirty-fourth in population; capital, Salem. The population increased from 672,765 in 1910 to 783,389 in 1920, or by 16.4 per cent; estimated population 1928, 902,000. The number of whites increased from 655,090 (1910) to 769,146 (1920); Indians decreased in number from 5090 to 4590; Chinese, from 7363 to 3090; the number of Japanese increased from 3418 to 4151; of Negroes from 1492 to 2144; and native whites from 552,089 to 666,995. The foreign-born white population decreased from 103,001 to 102,151. Both urban and rural populations mounted during the decade: the former from 307,060 to 391,019; the latter from 365,705 to 392,370. The growth of the principal cities was as follows: Portland (q.v.), from 207,214 in 1910 to 258,288 in 1920; Astoria, 9599 to 14,027; Salem, 14,094 to 17,679.

Agriculture. As Oregon is one of the important grain-growing States, agricultural conditions have reflected the fluctuations in price and production of grains during, and subsequent to, the World War. This situation is treated in detail under AGRICULTURE, CORN, WHEAT, BARLEY, etc. The number of farms increased 10.3 per cent, or from 45,502 in 1910 to 50,206 in 1920, and rose farther to 55,911 in 1925; the acreage in farms increased from 11,685,110 to 13,542,318 and to 14,130,847 (1925). The percentage of total land area in farms increased from 19.1 in 1910 to 22.1 in 1920 and 23.1 in 1925. The total value of farm property rose by 55 per cent or from \$528,243,782 in 1910 to \$818,559,751 in 1920, but diminished to \$714,410,119 in 1925; the average value per farm was \$11,609 in 1910, \$16,304 in 1920, and \$12,778 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 45,887 were operated by owners; 618, by managers; and 9406, by tenants. The corresponding figures for 1910 were 37,796; 847; and 6859. White farmers in 1920 numbered 49,633, compared with 44,875 in 1910; colored farmers numbered 573, compared with 627. Farms reported as under mortgage, 17,843 in 1920, numbered 20,990 in 1925. The total number of cattle was 851,108 in 1920; 784,459 in 1925. Of these, 280,411 in 1920 were dairy cows; 205,057 in 1925. The number of swine was 266,778 in 1920; 216,065 in 1925; the number of sheep was 2,002,378 in 1920; 1,775,093 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 2,952,000 bushels; wheat, 23,318,000; oats, 10,944,000; barley, 3,675,000;

potatoes, 6,240,000; apples, 6,950,000; and hay, 2,323,000 tons. Comparative figures for 1913 are corn, 598,000 bushels; wheat, 15,717,000; oats, 15,228,000; barley, 4,200,000; potatoes, 6,750,000; and hay, 1,732,000 tons.

Mining. The mineral resources of Oregon are not fully developed. Among the minerals produced are sand and gravel, gold, copper, silver, cement, and stone. The production of gold, copper, and silver subsequent to 1914 was as shown in the table. In addition to the minerals

Year	Gold	Silver	Copper
	Valued at	Fine ounces	Pounds
1914	\$1,591,461	142,552	89,248
1916	1,902,179	231,842	3,581,886
1918	1,270,465	107,323	2,451,016
1920	1,017,490	82,743	2,355,276
1921	822,034	42,120	174,300
1926	273,759	29,733	41,504
1928	225,968	30,924	358,463

mentioned above, the State also produces mineral waters and small quantities of lime and platinum. The total value of the mineral products in 1926 was \$6,941,355, compared with \$5,496,253 in 1920; \$3,962,822 in 1919; \$4,191,740 in 1918; and \$3,331,132 in 1914.

Manufactures. Oregon is not one of the most important industrial States, but its manufacturing activities are firmly established. In 1920 there were in the State four cities with more than 10,000 inhabitants, forming 38.4 per cent of the total population of the State; and in 1919 these reported 60.4 per cent of the State's manufactured products. There were 2246 manufacturing establishments in the State in 1909; 2707 in 1919; 1907 in 1925; and 1779 in 1927. Wage earners in manufactories numbered 58,559 in 1919, 59,563 in 1925; and 61,401 in 1927. The capital invested amounted to \$89,081,873 in 1909 and \$237,254,736 in 1919. The value of products amounted to \$93,004,845 in 1909; to \$366,782,627 in 1919; to \$352,763,595 in 1925; and to \$342,852,371 in 1927. The increase in the value of products evidenced in 1919 was in great measure due to changes in economic conditions brought about by the War and cannot be taken as an index of the growth of manufactures during the war period; but an increase in the average number of persons employed has clearly shown steady growth in the manufacturing activities of the State. The first industry in point of value of products is that relating to lumber and timber: these attained \$30,200,000 in 1909; \$95,264,000 in 1919; \$130,496,672 in 1925; \$112,242,264 in 1927. Flour-mill and gristmill products rank second in this respect: they were \$8,891,000 in 1909; \$42,550,000 in 1919; \$28,179,224 in 1925; \$21,201,405 in 1927. Foundry and machine-shop products, high in rank, were valued at \$3,135,000 in 1909; \$3,823,000 in 1914; \$31,689,000 in 1919; \$8,273,299 in 1927. Slaughtering and meat packing, also important, had products valued at \$5,880,000 in 1909, at \$7,487,000 in 1914; at \$15,868,000 in 1919; and \$15,310,566 in 1927. The chief manufacturing city is Portland; others are Astoria, Eugene, and Salem. In 1909 there were in Portland 649 manufacturing establishments, with a product valued at \$46,861,000; 846 in 1919, with \$196,380,000; in 1927 products were valued at \$146,973,636.

Education. Effort to maintain the high standard of efficiency has continued without interruption. A compulsory education law was

adopted by the people at the general election held in November, 1922. The history of the State is required to be taught in the schools, and there are also courses in moral instruction and physical education. In 1918 the Legislature enacted a physical-education law making it mandatory that all pupils in the elementary and secondary schools receive physical training for an average of at least 20 minutes a day. Progress was made during the decade in the rural schools and in nearly every county of the State consolidation was under way. The total number of consolidations for elementary schools for 1923 was 77, with an enrollment of 5585 pupils. In 1914 the State adopted a uniform system of standards for country and village schools. A movement for junior high schools developed. The Legislature of 1919 established a State Board for Vocational Education and substantial progress was made in this field, in agriculture, home economics, and technical training. The total enrollment in the elementary schools in 1925-26 was 142,711; in the high schools, it was 39,180; and the expenditure for public day schools was; current, \$14,782,738; outlays, \$4,167,209. Illiteracy decreased from 2.2 per cent in 1910 to 1.8 per cent in 1920; in the native white population, it remained at 0.5 per cent; among the foreign-born white, it decreased from 5.9 to 5.4 per cent; among the Negro, it increased from 3.7 to 5.5 per cent.

Finance. State expenditures for the year ended Sept. 30, 1927, as reported by the U. S. Department of Commerce, were: for maintenance and operation of governmental departments, \$11,976,691 (of which \$442,844 was aid to local education); for conducting public-service enterprises, \$3769; for interest on debt, \$2,906,486; for permanent improvements, \$7,182,648, total, \$22,069,594 (of which \$9,822,556 was for highways, \$3,137,610 being for maintenance and \$6,684,946 for construction). Revenues were \$22,954,710. Of this, property and special taxes formed 26.4 per cent, departmental earnings and charges for officers' services, 5.8 per cent; sales of licenses and taxation of gasoline, 50.7 per cent. Property valuation was \$1,110,677,349, State taxation thereon, \$5,286,824. Net State funded debt on Sept. 30, 1927, was \$36,155,029. Highway bonds outstanding were \$34,466,750.

Political and Other Events. In 1914 the Republican candidate for governor, James Withycombe, was elected; the Democrats reelected Senator Chamberlain. An amendment to the constitution, adopted by a large majority, prohibited the sale or manufacture within the State of intoxicants, but permitted importations. An amendment abolishing capital punishment also was adopted, but six years later, capital punishment was restored by vote of the people. Women participated in the elections for the first time in 1916. Minor State officers only were chosen. In the presidential voting of that year, Hughes received 126,968 votes; Wilson, 120,125. The prohibition section of the constitution adopted in 1914 was amended to prohibit importation of intoxicants into the State. An amendment empowering the governor to veto single items in appropriation bills also was carried. On June 7, 1916, the Columbia River Highway, a great scenic roadway, was dedicated. In 1917 the policy of expending automobile-license revenues on permanent highway construction was adopted. Through capitalization of these revenues, more

than \$40,000,000 was expended on pavement of trunk highways. In 1918 Governor Withycombe was reelected and Charles L. McNary, who had been appointed on the death of Senator Lane, was elected to the Senate. Governor Withycombe died in office, Mar. 3, 1919, and was succeeded by Ben W. Olcott. In 1920 Robert N. Stanfield, Republican, was elected Senator. In the presidential vote, Harding received 143,592; Cox, 80,019. In 1922 the Democrats elected Walter M. Pierce governor. The voters adopted a compulsory-school law which required that children over 8 and under 16 years of age be sent to the public schools during the school year. This law was framed with a view to suppressing private and parochial schools. It was sponsored by the Scottish Rite Masons and was supported by the Ku Klux Klan. The law was declared unconstitutional by the United States District Court, Mar. 31, 1924, and in 1925 by the United States Supreme Court. The vote for President in 1924 was: Coolidge, 142,579; Davis, 67,589; La Follette, 68,403. I. L. Patterson was elected governor by the Republican vote in 1926. In 1928 the vote for President was: Hoover, 205,341; Smith, 109,223.

Legislation. In 1915 a law was enacted, in accordance with the vote of the people in 1914, to prohibit the sale or manufacture of liquor in the State; but it permitted importations in limited quantities to individuals. In 1917, at the request of Secretary Lansing, the Legislature withdrew certain anti-alien bills designed to prevent Japanese from owning land in the State. Provision was made for a rural-credit system and for the establishment of county tuberculosis sanatoria and hospitals. This Legislature also passed a "bone-dry" prohibition bill. Amendments in the laws relating to the judiciary were made in 1917 and 1919. An enactment of 1919 forbade the display of the red flag on any other like symbol. In 1921 the Legislature provided for the State Board of Aviation, created the State Board of Control and the Budget Commission, and made provision for the Americanization of the foreign-born. It adopted, subject to approval by the people, thereafter given, optional cash or loan bonuses to veterans of the War. In 1923 the Legislature passed an income-tax law and an eight-hour law for lumber workers. It also established the Judicial Council with the Chief Justice as chairman. At this session, measures were passed against the holding of land by aliens, and requiring voters to be able to read and write English. A literacy requirement for Oregon voters was proposed as a constitutional amendment in 1925.

The Legislature in its session of 1929 passed an act for the more complete control of State-supported higher education. By the provisions of this act there was created a State board of higher education. Under its administration were placed the University of Oregon and the Oregon State Agricultural College, as well as the State normal schools, three in number. Its functions commenced on July 1, 1929. Among the services that it was expected to perform was that of eliminating duplication of courses and of departments, with a view to greater economy of effort. The creation of the board was likewise advocated as likely to rid the higher educational institutions of direct political rivalries, which were asserted to have interfered to some extent with their successful operation while independent of one another.

OREGON, UNIVERSITY OF. A State institution of higher learning for men and women, at Eugene and Portland, Ore., founded in 1872. During the years 1914-28, the enrollment increased from 1765 to 3237, with a summer-school registration in the latter year of 1295, and a faculty in the autumn of 1928 of 211 members. The income of the University for the year 1928 was \$1,687,862. The main library was increased from 53,000 to 195,491 volumes, in addition to which there were 9734 volumes in the medical school library. The schools of education, physical education, and sociology were founded between 1914 and 1924; the department of drama and the speaking arts was abolished in 1925 and a small amount of work in play production was placed in the department of English; the department of pre-engineering work also was discontinued during the same year and the work organized under the department of physics. Women's Hall, erected by funds raised by popular subscription, contained, besides the social hall in one wing, the Murray Warner Collection of Oriental Art of the Oregon Museum of Fine Arts, which was given to the university during the period, and several hundred volumes which were added to this collection in 1924. Other buildings erected included: McKenzie Hall, the school of medicine building, the commerce building, the women's dormitory, and the school of education group; Condon Hall to house the departments of geology and psychology and a reserved section of the university library, a building for the University Press, the Dorenbacher Hospital for crippled children on the medical school campus in Portland, in 1925; and in 1928 a men's dormitory at a cost of \$338,683. Numerous important gifts were received during the period, including a tract of 88 acres of land adjoining the campus of the medical school in Portland, a \$10,000 pipe organ for the newly completed recital hall of the school of music, a subscription of \$219,000 for a student-union building, and \$240,000 for a memorial court, all in 1924; \$128,500 from the General Education Board for the medical school, and a bequest valued at approximately \$50,000 from Mrs. Mary Ross Woodward, for the construction of the men's dormitory, mentioned above, in 1927; and in 1928, the sum of \$36,000 from the General Education Board, for the University of Oregon School of Medicine at Portland, a bequest of \$28,722 from the late Elizabeth H. Harmon for a fine-arts building; additions to the Murray Warner Oriental Art Collection; and land valued at \$15,000. President, Arnold Bennett Hall, J.D., LL.D.

OREGON STATE AGRICULTURAL COLLEGE. A State institution of higher education for men and women, at Corvallis, founded in 1868, when the State designed Corvallis College as the recipient of the Federal land-grant funds and began to appropriate State funds. In 1870 it became the State Agricultural College and in 1885 wholly a State institution. The college includes three main divisions: resident instruction; agricultural and engineering experiment stations; and extension service. The resident-instruction division in 1928 comprised 10 schools: Agriculture, chemical engineering, commerce, engineering and mechanical arts, forestry, home economics, military science, mines, pharmacy, and vocational education. These schools have 45 subdivisions offering degrees. In addition, the school of basic arts and sciences and other service departments afford instruction supple-

mental to the degree curricula. The total enrollment in all courses in 1928-29 was 5462. Of these, 3213, were men and 2249 women. The regular enrollment totaled 3828, with summer and other short-session enrollment, 1634. The income for 1927-28 from the original land-grant fund and other Federal funds, from the State of Oregon (millage tax), student fees, and certain appropriations from Oregon counties for extension work totaled \$2,116,226; of this amount, approximately \$1,902,500 was from the State and Federal governments. In addition to the 28 classroom buildings, there are three halls of residence for women and five for men. In 1927 the Memorial Union Building, costing \$500,000, was erected by student and alumni subscriptions. Other new buildings erected since 1926 include a women's dormitory, a men's dormitory, and a physics laboratory. The library contains about 87,000 volumes. Besides the campus and farms at Corvallis, there are eight branch experiment stations located in different parts of the State. The president in 1929 was William Jasper Kerr, D.Sc., LL.D.

ORELLANA, O'rā-lyū'na, JOSÉ MARIA (1872-1926). A President of Guatemala, who was born in Jicaro and educated at the Escuela Politecnica, a military institution. Entering the army at an early age, he rose to the rank of general. He was chief-of-staff to the President of the Republic, military instructor of the Eastern Army Division, military vocal of the Supreme Court, and commander-in-chief of the Army. He also served as Minister of Public Instruction, deputy in the National Congress, Counselor of State, and in December, 1921, was elected President. His administration was marked by road construction, financial reforms, and the economic reorganization of the country.

ORIENTAL PEACH MOTH. See ENTOMOLOGY, ECONOMIC.

ORLANDO, VITTORIO EMANUELE (1860-). An Italian statesman who was born at Palermo. He began his career as a professor of law, was elected deputy for Partinico in Sicily in 1897, and was Minister of Education in the Giolitti-Tittoni cabinet (1903-05) and of Justice under Giolitti (1907-09), and again under Salandra (November, 1914). He favored Italy's intervention in the World War, but later when he was Minister of the Interior under Boselli (June, 1916-October, 1917) he was blamed for the spread of defeatist propaganda. On the resignation of Boselli, he formed a new cabinet, retaining the portfolio of the Interior, and was Prime Minister at the time of the Peace Conference, and headed the Italian delegation there; but his cabinet fell in June, 1919, owing to his failure to secure a favorable settlement of Italian claims in Paris. He was president of the Chamber in 1919-20. When Mussolini made up the lists for the election of deputies in 1924, Orlando was one of the few non-Fascists to appear on it; but in August, 1925, he resigned because his views differed too greatly from those of the Fascists. See PEACE CONFERENCE AND TREATIES; ITALY, History.

ORNSTEIN, LEO (1895-). A Russo-American pianist and composer, born at Kremenchug, Russia. Until 1906 he studied at the

St. Petersburg Conservatory. He then came to New York and completed his education at the Institute of Musical Art under Bertha Feiring Tapper. His début in 1911 aroused great expectations, for he showed himself an artist of splendid technical equipment and keen insight. But as early as his second season, he discarded acknowledged musical standards and made up his programmes from the works of the extreme futurists, whom he also joined unreservedly as a composer. His numerous compositions are almost exclusively for piano or chamber ensembles. In 1924 he settled in Philadelphia as teacher of piano and composition at the Zeckwer-Hahn Musical Academy. Consult F. H. Martens, *Leo Ornstein: The Man, His Ideas, His Works* (New York, 1917).

ORPEN, SIR WILLIAM (1878-). An Irish painter, born at Stillorgan near Dublin. He entered the Dublin Art School at the age of 11, but owed his chief training to the radical Slade School in London. In 1899 he first exhibited at the New English Art Club, in which a powerful portrait of Augustus John brought him membership in 1900. In 1904 he was elected to the Royal Hibernian Academy and in 1910 became an Associate of the Royal Academy. Orpen was a versatile painter, brilliant in technique and facile in execution. His color was bright and strong, his treatment of light especially successful, his design striking, sometimes bizarre. He was thoroughly Irish in spirit, often whimsical and satiric, and delighted in Irish figure subjects, such as "The Irish Volunteer." One of his specialties was "portrait interiors," in which the sitter was represented in the intimate surroundings of his home. Two whimsical portraits of the artist himself in studio surroundings are in the Metropolitan Museum, New York City, and the Carnegie Institute, Pittsburgh. His commissioned portraits were more conventional in style, others, in which he attacked given technical problems, were freer, and many of himself, such as "The Artist at the Front" and "The Man from Arran." In 1918 he presented a number of his paintings of the World War to the nation, and in the next year exhibited two large pictures of the Peace Conference at Versailles. He was knighted in 1918 and has been president of the International Society of Sculptors, Painters, and Gravers since 1921. He wrote *An Onlooker in France* (1921) and *Stories of Old Ireland and Myself* (1924).

ORTHOGENESIS. See ZOOLOGY.

O'RYAN, JOHN F. (1874-). An American lawyer and soldier, born in New York City and educated at the College of the City of New York and the law department of New York University. In 1898 he was admitted to the bar. A member of the 7th Regiment of New York, he rose to the rank of major of field artillery and in 1912 was appointed major general of the New York National Guard. At the entrance of the United States into the World War in 1917, he was appointed major general in the National Army, and from 1917 to 1919, commanded the 27th Division of the American Expeditionary Forces in Belgium and France. This regiment participated in some of the most severe fighting of the War. He received decorations from foreign governments and the American Distinguished Service Medal. He was a member of the Public Service Commission of New York in 1922-26. In 1924 he conducted as counsel the investigation into the conduct

of the Veterans' Bureau. From 1926 on, he gave much attention to the development of air transport.

OSBORN, HENRY FAIRFIELD (1857-). An American palaeontologist (see Vol. XVII). Until 1924 he was vertebrate palaeontologist of the U. S. Geological Survey. Since that date, he has been senior geologist of the Survey, retaining the presidency of the American Museum of Natural History (N. Y.) and the research professorship of zoology at Columbia University. His publications include *Origin and Evolution of Life* (1917), *Impressions of Great Naturalists* (1924), *The Earth Speaks to Bryan* (1925), *Evolution and Religion in Education* (1926), *Creative Education* (1927), and *Man Rises to Parnassus* (1927).

OSBURN, RAYMOND CARROLL (1872-). An American zoologist born in Newark, Ohio, and educated at Ohio State University and Columbia University. He was instructor in biology at Starling Medical College (1898-99), professor of biology at the Fargo (N. D.) College (1899-1902); instructor at the New York High School of Commerce (1903-07); instructor in zoology (1907-10) and assistant professor (1910-15) at Barnard College, professor of biology at Connecticut Women's College (1915-17), and professor of zoology at Ohio State University (1917-). Professor Osburn published taxonomic papers on the byozoa and was for a number of years on the investigation staff at the United States Bureau of Fisheries Laboratory at Woods Hole, Mass.

O'SHAUGHNESSY, EDITH COUES (Mrs NELSON O'SHAUGHNESSY) (?-). An American writer, born in Columbia, S. C., and educated under private tutors. In 1901 she married Nelson O'Shaughnessy of New York, who was in the diplomatic service. While the latter was chargé d'affaires in Mexico in 1916, she made careful notes of political and social affairs which enabled her to write *A Diplomat's Wife in Mexico*, an enlightening and entertaining account of stirring events in that country. This was followed by *Diplomatic Days in Mexico* (1917); *My Lorraine Journal* (1918); *Alsace in Rust and Gold* (1919); *Intimate Pages of Mexican History* (1920), *Viennese Medley* (1924); *Married Life* (1925).

OSLER, OSLEI, SIR WILLIAM (1849-1919). A British physician and author (see Vol. XVII). During the period from 1914 to the time of his death, Dr. Osler wrote two major works, *A Concise History of Medicine* (1919) and *The Evolution of Modern Medicine* (1921). Since his demise, extracts from his works have been edited by C. N. B. Camac with the title, *Counsels and Ideals* (1921). Consult *The Life of Sir William Osler*, by Harvey Cushing (2 vols., 1925).

OSLO (formerly Christiania). The capital and commercial centre of Norway. The population at the census of 1920 was 258,483. In the rapidly growing suburbs of Oslo live more than one-third of the inhabitants of Norway. Garden suburbs have been laid out, under the auspices of the municipality, at Ullevall, Lille-Thøien, Lindern, and Thorshaug. Between 1912 and 1923, the city spent about 100,000,000 kroner (\$27,000,000) in erecting low rental buildings. In 1928 a subway, the only one in Scandinavia, was opened and in its first year carried 3,200,000 passengers. There were 21 cars in operation. Oslo's export traffic has shown a marked increase since 1920 primarily as a result of the ever-

increasing development of oversea routes. It is the starting point of more oversea routes than any other port in Scandinavia. The Oslo quays have a total length of 34,000 feet, and the adjacent areas belonging to the port cover about 360,000 square yards. Vessels with a draught up to 32 feet can be accommodated. In 1927, 2125 vessels of 1,766,539 tonnage entered the port, and 1543 vessels of 1,451,369 tonnage were cleared.

Oslo is widely known for its valuable collections of Scandinaviana. The most famous is the University Collection of Norse Antiquities, which includes two Viking ships excavated from burial mounds at Gokstad and Oseberg in 1880 and 1903. The Oseberg ship was the pleasure launch of Queen Aasa, the grandmother of Harald the Fairheaded; in death, it served as her coffin. With the queen were buried a bondswoman, her beautifully carved sleighs and carriage, food, and numerous articles which were intended to be of use to her on her journey to Valhalla. The museum also includes the collection brought home by Roald Amundsen and the Gja Expedition from the country of the Netchill Eskimos. At Bygd, one of the suburbs of Oslo, is the Norsk Folkemuseum, an open-air museum consisting of several ancient homesteads which were removed to this ideal setting from various parts of Norway and which give a vivid impression of the life of the Norwegian peasants since the time of the Vikings. The entire "parish" clusters about an old timber church which was used for more than 800 years at Gol in Hallingdal. The State Gallery of Fine Arts, opposite the Historical Museum of the Royal Frederik University, contains a representative collection of Norwegian art. In the Museum of Arts and Crafts are found examples of the home industries and crafts of the peasantry. The Ski Museum contains the equipments used by several Norwegian polar explorers; the most important is the one used by Amundsen on his conquests of the South Pole and of the Northwest and Northeast passages.

In the summer of 1924, the Norwegian Storting (Parliament) decided by an overwhelming majority to alter the name of the capital from Christiania to Oslo, the change to take effect Jan. 1, 1925. Oslo was the name of Norway's old capital founded, according to tradition, by King Harald Haardraade in 1048. When in 1624 a great fire laid waste the ancient town, King Christian IV of Denmark, under whose rule Norway was at that time, forbade the inhabitants to rebuild on the old site. Instead, they were commanded to erect their dwellings on the other side of the bay under the walls of the Akershus fortress and to name the town Christiania. The Oslians chose the 300th anniversary of the founding of Christiania to shake off this memory of foreign domination.

OSSENDOWSKI, FERDINAND ANTONI (1876-

) A Polish writer, explorer, and scientist. He was head of a polytechnic school at Tomsk, Russia, from 1902 to 1903, and was arrested for his part in the Polish Revolution of 1905 and exiled to Siberia, where after the Russian revolutions of 1917, he joined Kolchak's anti-Bolshevist forces. Following Kolchak's death in 1920, he escaped into Tibet and western China, where he encountered the adventures related in *Beasts, Men and Gods* (1922; English trans., 1923). The book has been translated into more than

20 languages and over 1,000,000 copies sold in three years. During 1922-24 he taught in the commercial academy at Warsaw. Later, he conducted explorations in Asia and Africa. His other works published in English, with the date of translation, include *Man and Mystery in Asia* (1924); *The Shadow of the Gloomy East* (1925); *From President to Prison* (1925); *The Fire of Desert Folk*, on travels in Morocco and Tunisia (1926); and *Slaves of the Sun*, concerning explorations in the Congo (1928). Lewis Stanton Palen collaborated in the translations. Consult *Ossendowski und die Wahrheit*, by Sven Anders Hedin (1925).

OSTWALD, öst'vált, WILHELM (1853-

) A German chemist and philosopher (see VOL. XVII). He was editor of *Der Monist* (1912-15). He published *Der Farbenatlas* (1917); *Die Farbenlehre* (1918-19); *Die Harmonie der Farben* (1918); *Goethe, Schopenhauer, und die Farbenlehre* (1918); *Die Farbkörper* (1919); *Die Farbschule* (1919); *Einführung in die Farbenlehre* (1919); *Die Harmonie der Formen* (1922); *Die Welt der Formen* (1922-24); *Farbenkunde* (1923), and an autobiography (1926-27). He lectured at Columbia and Harvard universities and founded a laboratory for color study in Dresden in 1920.

OTIRA TUNNEL. See TUNNELS

OTTAWA. A city of eastern Ontario and capital of the Dominion of Canada. The population in 1928 was estimated to be 121,000. The area is more than 5000 acres. Ottawa is governed by the Board of Control composed of a mayor and four controllers and a council of 18 aldermen elected annually. The mayor and controllers are elected by general vote; the aldermen are elected by wards, two for each ward. The mayor, by virtue of his office, is chairman of the Board of Control and is represented on all committees and commissions appointed by the council. On Feb. 3, 1916, the imposing group of Parliament Buildings was almost totally destroyed by fire but was rebuilt on practically the same plans, with an additional story, at a cost of \$10,000,000. In 1928 Parliament voted \$3,000,000 to be expended on the beautification of Ottawa; the plans included the creation of an open space in the heart of the city to be known as Confederation Park. About \$200,000 also was granted each year for 16 years for the maintenance of an elaborate system of parks and drives under the jurisdiction of the Federal District Commission appointed by the Dominion government. This commission functioned for many years as the Ottawa Improvement Commission, until in 1927 it was reconstituted with wider powers as the Federal District Commission.

The Champlain Bridge across the Ottawa River at Remic Rapids was constructed between 1924 and 1929 under the auspices of the Federal District Commission as part of the scheme for the beautification and improvement of Ottawa. The bridge was named in honor of Champlain, as its site was adjacent to the portage used by the French explorer to reach the Ottawa River. The type of construction was that of deck plate-girder spans, each span consisting of a pair of girders supporting steel floor beams. There were 22 plate-girder spans of 70 feet each and four spans of 125 feet, carried on reinforced concrete piers faced with pre-cast artificial stone. The width of the roadway is 24 feet and of the sidewalks, 5 feet 6 inches each. The total length

of the bridge is about one mile, including the steel viaduct on Bate Island, 260 feet in length. The cost of construction was approximately \$750,000. In 1929 a research filtration laboratory was established in Ottawa, preparatory to the construction of a \$1,315,000 sand-filtration plant at Lemieux Island in the Ottawa River.

In 1928 Ottawa had 18 public schools and 41 separate schools with an aggregate attendance of 24,000 pupils, 2 collegiate institutes, 1 university, and 10 colleges. Bank clearings in 1928 amounted to \$375,000,000 and the assessed valuation of property, to \$146,428,131; the output of 203 industrial plants was valued at \$60,000,000. The headquarters of the Canadian Air Force are located at Ottawa, which serves as the main technical and stores depot. The hundredth anniversary of the city's founding was celebrated in August, 1926.

OVERMAN, LEE SLATER (1854-). A United States Senator (see VOL. XVII). He was reelected to the Senate for a third term in 1914. This was the first senatorial election by a direct vote of the people of North Carolina. In 1920 and 1926, he was also reelected. He was one of the most conspicuous of the Democratic members of the Senate.

OVERTON, GRANT (MARTIN) (1887-). An American writer, born at Patchogue, N. Y. He studied at Princeton University from 1904 to 1906 and for several years was on the staffs of newspapers in New York, Denver, and San

Francisco. After a trip at sea before the mast, he became an editorial writer for the *New York Sun* in 1910 and was later its literary editor and a contributor to several magazines. He was fiction editor of *Collier's*, 1924-27, and consulting editor after May, 1927. His books include *The Women Who Make Our Novels* (1918); *Mermad* (1920); *World without End* (1921); *The Answer*, a novel on the life of Walt Whitman (1921); *Island of the Innocent* (1923); *The Thousand-and-first Night* (1924); *The Philosophy of Fiction* (1928). He edited *Mirrors of the Year* (1926-27); *Cream of the Jug*, humorous stories (1927); and *The World's 100 Best Short Stories* (1927).

OVIDIO, dō-vēd'yō, FRANCESCO D' (1849-1924). An Italian philologist (see VOL. VII). His later books include *L'avversione di Ruggiero Bonghi alla triplice alleanza* (1915); *L'origine della presenta guerra* (1915); and *Benevenuto da Imola e la legenda vergiliana* (1916).

OWEN, ROBERT LATHAM (1856-) A United States ex-Senator from Oklahoma. He first took his seat in 1907 and was reelected in 1912 and again in 1918 for the term expiring Mar. 3, 1925. He was active in the passage of the Federal Reserve Act and the Farm Loan Act in the Senate.

P

PACIFIC OCEAN ISLANDS. The more important groups of islands in the Pacific Ocean are given below. For American possessions, see **PHILIPPINE ISLANDS**, **HAWAII**, **GUAM**, **SAMOA**. For the Yap agreement, see **YAP**. For a discussion of the political problem of the Pacific, see **WASHINGTON CONFERENCE**.

Caroline and Pelew Islands. A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. The islands are divided into two groups: (1) the Eastern Carolines with Ponapé as the centre; and (2) the Western Carolines with Yap as the centre. The population reported (1928) was made up of 2892 Japanese, 57 foreigners, and 37,484 natives. Copra is the chief export. See **YAP** for the dispute between the United States and Japan over the disposition of this island.

Cook Islands. A group in the Southern Pacific belonging to New Zealand. Total area, 280 square miles, population, in 1926, 13,877. In 1915 the laws for the islands were consolidated and a member of the New Zealand Executive Council was made Minister of the Cook Islands. In 1927 imports totaled £130,612 and exports £152,707. Trade is largely with New Zealand, exports being mainly fruits. Copra is sent to the United States (£40,279 in 1927). Revenues for 1927-28 were £25,053 and expenditures, £23,924. A wireless station is maintained on Rarotonga, the chief island. Many of the islands are leased to private coconut companies for exploitation. The Niue Islands have a population of 3795 and are concerned largely with copra production.

Fiji Islands. A group of 250 islands in the Southern Pacific, constituting a British Crown colony. The largest are Viti Levu and Vanua Levu. Total area, including Roturna (a dependency), 7083 square miles; population (1927), 171,644, made up of 4184 Europeans, 89,401 Fijians, 68,733 Indians, 987 Chinese, 3071 half-castes, and 5268 others. In attendance at the Methodist churches in 1927 were 80,991 natives. Out of 1000 schools on the islands, the Government was wholly supporting nine and aiding 55 in 1927. Expenditure on education in 1927 was £34,027. In 1927 there were under cultivation by Europeans and Indian settlers 47,713 acres of coconuts, 49,121 acres of sugar cane, 7392 acres of rice. Bananas, maize, tobacco, rubber, and beans are other crops. Exports in 1913 were £1,425,940, in 1927, £1,997,374 (sugar, £1,125,215). Imports for the same years were £903,968 and £1,223,303. The trade is carried on largely with British possessions. Revenues and expenditures for 1913 were £266,037 and £258,792; for 1927, £586,574 and £534,939. There was a public debt in 1927 of £153,550 (£93,515 in 1911). Wireless telegraph stations were erected at Suava, Labasa, Taveuni, and

Savusavu. The Governor of Fiji is also high commissioner for the Western Pacific.

Gilbert and Ellice Islands Colony. These islands were annexed as a colony to Great Britain in November, 1915. The Gilbert Islands are on the equator and have an area of 166 square miles, and a population in 1926 of 23,410. The Ellice Islands have an area of 14 square miles, and a population of 3582. Ocean Island, the colony headquarters, has a population of 2386. A wireless station here maintains telegraph communication with the outside world via Fiji and Australia. The very rich phosphate deposits on the island were, after 1921, worked by the British Phosphate Commission. Other islands in the colony are the Union or Tokelau group, and the American Islands. Of the latter, Christmas Island is the largest atoll in the Pacific. It was leased in 1914 to the Pacific Coconut Plantations, Ltd., for exploitation; population, 4 Europeans and 28 Tahitians. Fanning and Washington islands, also in this group, are being worked by a coconut company. Total revenues for the whole colony for 1926-27 were £52,925 and expenditures £44,869. The trade in 1926-27 amounted to £113,453 (incomplete figures) for imports and £395,728 for exports (phosphates, £355,815; copra, £39,341).

Marianne (ma'i-l-an') or Ladrone Islands. A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. Native population numbered in 1926, 48,994 and the Japanese, 8395. Guam (q.v.), the largest island, belongs to the United States.

Marquesas (mar-kā'sas) Islands. A group of islands in the Western Pacific belonging to France and administered from Papeete. Total area, 480 square miles; population, 2255. Hiva-oa and Nukahiva are the principal islands.

Marshall Islands. A group of islands in the Western Pacific, formerly part of German New Guinea, but since 1918 a Japanese mandate territory. The group is made up of two chains, viz., Ratak (13 islands) and Ralik (11 islands). The population consists of 260 Japanese, 11 Europeans, and 9390 natives. Coconut-palm plantations cover 1705 hectares, and the chief export is copra.

Nauru. An island in the Western Pacific just south of the equator, formerly part of German New Guinea, but since 1920 administered by Great Britain under a mandate from the League of Nations. It is a circular atoll only 12 miles in circumference. Population in 1928: 131 Europeans, 1051 Chinese, 1297 Nauruans, 20 other South Sea Islanders. The important phosphate deposits were placed in the hands of the British Phosphate Commission representing the governments of Great Britain, Australia, and New Zealand. Costs of administration, if ordinary revenues did not suffice, were to be met out of the phosphate sales. Phosphate exports in-

creased from 101,267 tons in 1917 to 318,185 tons in 1927. Imports were valued at £82,649 in 1927. The German wireless station, though dismantled by the Germans, was soon restored. The island fell in September, 1914, before a British naval force and from 1915 on was occupied by a civil administration.

New Caledonia. A French colony in the Western Pacific consisting of the island of New Caledonia (area, 8548 square miles) and four groups of island dependencies. Population (1921), 47,506, made up of 14,172 free settlers, 2310 of convict origin, and 25,123 Melanesians and Polynesians. Nouméa, the capital, had 9336 inhabitants, of whom 6328 were free (1921). Leading products are nickel, chrome iron, manganese, and cobalt, as well as copra, hides, and preserved meats. Local blast furnaces produced 4435 tons of nickel valued at 12,475,000 francs in 1926. Total exports for 1913, 1920, 1927 were 15,838,405 francs, 43,043,449 francs, 87,195,849 francs. Imports for 1927 were 154,771,189 francs. The budget for 1927 balanced at 28,080,437 francs. The Loyalty Islands, which belong to this group, possess rich guano deposits; on the Wallis and Horn Islands, copra is the leading product. The latter islands were formed into a colony in 1913.

New Hebrides, hēb'ri-dēz. These are administered jointly by French and British officials. Area, 5700 square miles; population (1926), 60,000. Several French and British trading companies operate here. Imports in 1926 were 30,457,405 francs; exports (maize, copra, coffee, cotton, sandalwood, cocoa), 43,267,835 francs. French trade represented 20,326,172 francs of the imports and 34,371,306 francs of the exports. Interchange is mainly with Sydney and Nouméa (New Caledonia). The joint revenues and expenditures in 1927 balanced at 3,209,000 francs. The local budget for 1928 was 5,148,000 francs. Beginning with 1919, the islands became the seat of a strong agitation for the termination of the condominium (1906) and accession by France. The question was discussed at the British Imperial Conference in 1921, and again later in the year, when an offer was made by a French private company to buy out the British rights. Complaints were frequent, particularly over the cumbersome methods of administering justice. However, the condominium was renewed by the protocol of London on Mar. 18, 1922.

Norfolk (nōr'fak) Island. An island in the Southern Pacific, a dependency of Australia. Area, 13 square miles; population (1926) 853. Up to 1914, it was governed from New South Wales. Imports in 1926-27 were £27,869 and exports, £13,578.

Phoenix Group. This is made up of eight islands with a total area of 16 square miles, and a population of 59. They belong to Great Britain but are leased to a trading company for coconut planting.

Samoa. A group of islands in the Western Pacific, formerly a German possession, but since 1920 administered by New Zealand under a mandate from the League of Nations. The group, comprising the large islands of Savaii and Upolu and several adjacent islets, was given the name Territory of Western Samoa. Area, about 1300 square miles; population (1927), 2564 Europeans and half-castes, 39,215 native Samoans, 939 coolie laborers, 147 other islanders. Education is in the hands of the London Missionary Society, the Methodist Mission, the Catholic Mission, and

the Latter-day Saints' Mission. Imports for 1927 were £304,369 and exports £335,978 (copra and cocoa beans largely). Revenues for 1927-28 were £126,038 and expenditures £143,121. The United States takes most of the copra exported. New Zealand forces occupied the islands on Aug. 29, 1914. In 1918, 7500 natives died from influenza, the region being one of those that suffered most severely. A wireless station was erected at Apia, the Territory's port. The local administration has made provision for a nominated legislative council in which native Samoans have seats. For the American Samoan Islands, see article SAMOA.

Society Islands. A group in the Western Pacific belonging to France. Total area, 650 square miles; population, 10,422. Tahiti, the most important island, has an area of 600 square miles, and a population of 8585 (census of 1926). Papeete, on Tahiti, is the seat of administration of the French establishments in Oceania, and possesses a wireless station. It has 4601 inhabitants of whom 2126 are French. The chief industries of Tahiti are the preparation of copra, sugar, and rum. Vanilla, coffee, and cacao are cultivated. Other islands belonging to the Society group are Moorea (area, 50 square miles; population, 1837) and Iles-sous-le-Vent (area, 363 square kilometers, population, 6689).

All the French establishments (i.e., Society Islands, Marquesas, Tuamotu, and Tubuai groups) have a total area of 1520 square miles, and a population in 1926 of 35,862, made up of 870 French, 217 English, 3989 Chinese, and the rest natives. Leading exports are copra, mother-of-pearl, hides, coconut oil, phosphates, coffee, vanilla, cotton. Exports in 1913, 1920, 1927 were valued at 11,554,507 francs, 24,360,900 francs, and 49,032,248 francs. Imports in 1927 were 50,596,237 francs. The budget for 1927 balanced at 15,167,573 francs; in 1911 it was 1,745,000 francs. Some 5000 lives were lost in these islands in the influenza epidemic of 1918.

Solomon Islands. A British protectorate in 8°S. and 160°W., made up of 15 large islands and the following groups: Loid Howe group, Santa Cruz Islands, Mitre Islands, and the Duff or Wilson group. Total area, 11,000 square miles; European population (1922), 493, native population, 150,000, Asiatics, 63. Coconuts are cultivated over 30,000 acres, other products are rubber, fruits, copra (22,316 tons in 1926-27). Imports for 1927-28 were £261,741; exports (mainly copra), £386,546. Revenues for 1927-28 were £75,664; expenditures, £73,993. The islands in the group owned by Germany became part of the Australian mandate territory of New Guinea after the World War. See NEW GUINEA.

Tonga or Friendly Islands. A group of islands in the Western Pacific, forming a British protectorate. Total area, 385 square miles; population (1926 estimate), 27,048, made up of 25,918 Tongans, 235 half-castes, 365 other Pacific islanders, 530 Europeans. The natives are Christians, belonging to the Free Church of Tonga, Methodist, and to Catholic churches. Copra is the chief product, more than half of it going to the United States. Imports in 1927 were valued at £157,783; exports, at £235,391. Revenues in 1926-27 totaled £72,562 and expenditures, £83,513. A wireless station at Nukualofa is in touch with Samoa and Fiji. The reigning sovereign, Queen Salote, came to the throne in 1918.

Tuamotu (too'-a-mō'tōō) **Islands.** A group in the Western Pacific belonging to France and administered from Papeete. Total area, 55 square kilometers; population, 4276. Makatēa, the principal island, has important phosphate deposits. In the Gambier Islands, pearls and mother-of-pearl are the leading products.

Tubuai Islands. A group in the Western Pacific belonging to France and administered from Papeete. Area, 115 square miles; population, 3170. Coffee is grown there.

PACK, CHARLES LATHROP (1857-). An American forester and economist, born at Lexington, Mich., and educated in the public schools at Cleveland. He studied forestry in Germany. For several years, he explored forests in Canada, the Northwest, Louisiana, and Mississippi. He was a director and official in many important financial institutions and, from 1917 to 1919, president of the National War Garden Commission. He was president also of the American Forestry Association from 1916 to 1920 and of the National Conservation Congress in 1913. He was chairman of the French Agricultural Committee of the American Commission for devastated France. For his services in France, he was awarded several medals. He wrote much on agricultural subjects, including *The War Garden Victorious*; *Memorial Trees*; *Roads of Remembrance*; *School Book of Forestry* (1922); *Trees as Good Citizens* (1923); *Forestry Primer* (1926).

PACKING INDUSTRY. See **LIVE STOCK.**

PADELFORD, FREDERICK MORGAN (1875-). An American college professor, born at Haverhill, Mass., and educated at Colby College, Yale, and Oxford. He was for one year a fellow at Yale and from 1889 to 1901 was professor of English at the University of Idaho. In the latter year, he became professor of English at the University of Washington, and in 1920 dean of the graduate school at that university. He was a member of several societies and author of *Old English Musical Terms* (1900); *Early Seventeenth Century Lyrics* (1906); *Samuel Osborne, Janitor* (1913); *George Dana Boardman Pepper, a Biographical Sketch* (1914); and *The Poems of Henry Howard, Earl of Surrey* (1920). He also made translations, edited English texts, and contributed to *The Cambridge History of English Literature* and to European and American magazines. With W. Howe and H. M. Ayres, he edited the *Modern Students' Book of English Literature* (1924).

PADEREWSKI, pa'de-réf'ské, IGNACE JAN (1860-). A Polish pianist and composer (see Vol. XVII). On May 9, 1917, he made at the Metropolitan Opera House, on the occasion of a gala performance in honor of General Joffre, his farewell appearance, which he declared was to close forever his pianistic career. He then plunged into the midst of the political turmoil. At the beginning of the World War and after, he had appeared at his concerts also as a political orator of no mean ability and contributed the greater part of the proceeds to the cause of Poland. After 1917 he devoted his entire time and energy to recruiting from among the Poles in the United States an army of 100,000 men and 50 officers, which subsequently constituted the greater part of the Polish Army in France. As soon as circumstances permitted, he went personally to Poland (1918), where he became the leader of the Conservative Party and was largely instrumental in organizing the new Polish Re-

public, of which he became Premier and Minister of Foreign Affairs (Jan. 26, 1919). In this capacity, he took active part in the Peace Conference at Versailles. The unsettled conditions in Poland brought about the the downfall of the cabinet in December, 1919; and Paderewski, his health seriously impaired by the stress of events, retired to his estate at Paso Robles (California). Here, however, he kept in close touch with the political situation of his native country. As he had sacrificed the greater part of his fortune to the cause of Poland, he found himself compelled to rescind the resolution regarding his artistic career, and on Nov. 22, 1922, he reappeared amidst scenes of indescribable enthusiasm at a recital in New York. Fortunately for art, he continued his distinguished artistic career and proved that the intervening five years of political excitement had not in the least impaired his supreme mastery. See **POLAND, History.**

PAGE, HERMAN (1866-). An American Protestant Episcopal bishop, born at Boston, and educated at Harvard and at the Episcopal Theological School. He was ordained in 1891 and until 1900 was in charge of mission churches in Idaho. He was rector of St. Paul's Church in Chicago from 1900 to 1914 and was consecrated Bishop of Spokane, Wash., in 1914. He became Bishop of Michigan in 1923.

PAGE, THOMAS NELSON (1853-1922). An American writer and diplomat (see Vol. XVII). He was appointed Ambassador to Italy by President Wilson in 1913 and served in that capacity through the difficult period of the World War, until 1919. His later books included *The Land of the Spirit* (1913) and *Italy and the World War* (1920).

PAGE, WALTER HINES (1855-1918). An American publisher, writer, and diplomat (see Vol. XVII). In 1913 he was appointed Ambassador to Great Britain. His strong and frankly expressed sympathy with the English attitude during the years in which he held this post made him a popular figure in England. Much of his time, as indicated in his letters, was spent in convincing President Wilson and the officers of his government of the necessity of taking a more aggressive attitude and in favor of the Allies. During his ambassadorship, he won high praise in all quarters by the tact which he displayed and his skill in dealing with delicate and complicated problems. His strength was unable to withstand the strain imposed on him. He resigned his post in 1918 and returned to the United States, where he died on October 12. His *Life and Letters*, by Burton J. Hendrick, published in 1922, is one of the most illuminating records of the events of 1914 to 1918 in international politics. *The Earlier Life and Letters of Walter H. Page*, by Mr. Hendrick, appeared in 1928.

PAGE, WILLIAM HERBERT (1868-). An American lawyer and teacher, born at Mount Union, Ohio, and educated at Yale University and the law department of Ohio State University, where he was professor of law from 1896 to 1917. In the latter year, he assumed a like position at the University of Wisconsin. His many writings on legal subjects included *Page on Wills* (1901); *Page's Ohio Digest* (1914); *Compact Code* (1921); *Annotations to General Code* (1922). He is editor-in-chief of the *Wisconsin Law Review*.

PAHANG. See **MALAY STATES, FEDERATED.**

PAHLEVI I, SHAH OF PERSIA. See RIZA KHAN PAHLEVI.

PAIN, BARRY (1867-1928). An English author (see Vol. XVII). After his visit to the United States (1914-15), he served in the Royal Naval Volunteer Reserve (1915-16), and then on the London Appeal Tribunal. His later works, chiefly parodies or humorous stories, were: *The Short Story* (1915); *The Problem Club* (1919); *The Death of Maurice* (1920); *Marge Askinfort* (1921); *This Charming Green Hat Affair* (1925); and *Essays of To-day and Yesterday* (1926).

PAINE, ALBERT BIGELOW (1861-). An American author and editor (see Vol. XVII). His later writings include: *The Boy's Life of Mark Twain* (1916); *Mark Twain's Letters* (1917); *George Fisher Baker, a Biography* (1919); *A Short Life of Mark Twain* (1920); *The Car That Went Abroad* (1921); *In One Man's Life* (1921); *Single Reels* (1923); *Joan of Arc* (1925); *The Girl in White Armor* (1927).

PAINLEVÉ, pân'le-vâ', PAUL (1863-). A French statesman and scientist, particularly interested in mathematics and aviation (see Vol. XVII). He became a member of the Institute of France and the Academy of Science. In October, 1915, he was appointed Minister of Instruction and Inventions affecting national defense, in the Briand cabinet, later succeeding General Gallieni as Minister of War. He was also a member of the War Committee and from September to November, 1917, Prime Minister and Minister of War. As Minister of War, he was accused by the supporters of General Nivelle of having interfered with the French offensive of April, 1917. In 1920 he was appointed advisory director general of Chinese government railways. He was chosen President of the new Chamber in the spring of 1924, resigning in April, 1925, to form a cabinet of his own, in which he held the War portfolio. He continued as Minister of War in most succeeding governments. He resigned the premiership on Nov. 28, 1925, but as Minister of War, he supervised operations against the Druse revolt in Syria and that of Abd-el-Krim in Morocco. He also served as French delegate to the League of Nations and as president of the Committee of International Cooperation. He is the author of several scientific books and *A Life of Nurse Cavell*.

PAINTING. The history of painting in recent years has been a continuation of the struggle which became acute during the first decade of the twentieth century, between the movement known as modernism, or post-impressionism, or, better still, as expressionism, and impressionism, and other more conservative factors in painting. The year of the World War almost completely checked artistic production in Europe except in so far as it could be drafted into war service, and most of this war painting was propaganda rather than art. At the end of the War, the situation was very much the same as just before it and the struggle was still continuing in 1928. Painters were concerned with studying the means of artistic production rather than with producing real works of art. Many theories were expounded and still more pictures put on canvas to demonstrate them, but relatively little of real value had been created. It was the threshold of a new epoch, but what the result would be no one could tell. One encouraging sign was that painters of the new tendencies were so much

concerned with expression, with the inner truth, with the essence, rather than with the mere aspect, of nature.

France. By the end of the first decade of the twentieth century, impressionism had conquered its rivals, realism and other academic tendencies, and had become dominant in official, as well as in artistic, circles. From 1913 to 1921, Paul Albert Besnard (1849-), an impressionist painter, was head of the École de France at Rome and after 1922 director of the national École des Beaux Arts at Paris. It was he above all others who applied the impressionist technique to mural painting. He was highly successful also as a portrait painter of women. Among other decorators of note were Jules Cheret, who united impressionism with the tradition of Fragonard; Henri Martin, the painter of Languedoc; and Edmond Aman-Jean. Most mural painters, however, never fully accepted impressionism. Among painters affected by it, Lucien Simon, with an admixture of realism, painted homely scenes; Charles Cottet, Parisian society. The chief pioneers of impressionism had for the most part passed on, Degas in 1917, Renoir in 1919, both active and developing till the end; and Claude Monet continued painting his scintillating landscapes till his death in 1926. Among the younger men of strict impressionistic technique were Albert André, who is best in still life, Maufra, Moiré, and Casals for Spanish subjects.

Great as were the achievements of impressionism, it had a serious defect which induced a speedy reaction. Concerned only with the representation of light, with the appearance of things, it had no inner life and lacked the gift of psychology. The various modernist movements therefore insisted on expressionism, i.e., that the painting should represent not so much nature itself as the painter's reaction toward nature, the emotions roused in him by the object depicted. This led to the rejection of nature as a norm. Rejecting also the flat surfaces of impressionism, the post-impressionists strove for solidity and structure. Design should be organized and not haphazard, as it is in nature; color and form symbolic, rather than realistic. One form of this reaction was symbolism, which presents nature in a symbolic, as distinct from the actual, form. Its foremost exponent was the delightful pastellist and illustrator, Odilon Redon (1840-1916). The group included such staunch modernists as Paul Sérusier, Maurice Denis, Pierre Bonnard, and Édouard Vuillard. The art of the first two is mystic and religious, while that of the others is decorative; Vuillard especially has been influenced by Japanese art. One group's reaction against impressionism consisted of imitation of Italian fifteenth-century art, or what the English call Pre-Raphaelitism. Foremost among them were Félix Vallotton and Jean Frélaud, both painters of Breton subjects.

The group known as "Les Fauves" was at first made up chiefly of pupils of Gustave Morot (1828-98), a symbolist. Rejecting their master's academic tendencies, they expressed themselves with such wildness that this term, signifying "wild beasts," was applied to them. Foremost among this group was Henri Matisse (1869-), a very abstract painter who pushes simplification to the utmost, striving indeed to attain the vision of a child. Both in line, of which he is a consummate master, especially

of outline, and in color, his art recalls Chinese and Japanese painting. The group included also Kees van Dongen (born 1877), a Dutchman, who achieved fame in portraying distinguished members of Parisian society, and Modigliani (1889-1920), an Italian, who created simply colored figures based on the conventions of Negro art. Others of the "Fauves" afterward developed in various directions, some becoming cubists, others following Cézanne's lead. As time went on, Cézanne became more and more the dominant influence in modernist art. His closest follower was André Derain (born 1880), an artist of great power, both in figure and landscape, whose color became increasingly severe. Another important figure was Maurice de Vlaminck (born 1876), a highly dramatic landscape painter of brilliant technique. It was he who discovered Negro art as revealed in the wooden fetishes of the African savages, carved before their association with white men. Here was an art of pure plastic quality, simplified to the utmost, abstract in form, and with very remote resemblance to actuality. It greatly influenced the new movement, especially cubism. Among other artists once classed among the "Fauves" who were affected by cubism were Albert Marquet, Othon Friesz, Jean Marchand, and Segonzak. There was at the close of this period an increasing tendency among them to use forms based on nature rather than pure abstractions. Henri Rousseau (1844-1910), a customs official of Paris, began painting late in life in a quaint, primitive style, charmingly bourgeois in spirit. His subjects were portraits, the environs of Paris, and exotic landscapes, reminiscent of his military service in Mexico. George Rouault (born 1871) is known for his strange figure subjects, and Maurice Utrillo (born 1883), a drunken genius, paints streets and buildings, solidly constructed as if by a mason, fair white cathedrals, and the like. A curious outgrowth of the modernist movement was feminism in painting. There have been women painters at all epochs, but their art has not differed materially from that of men. The art of Marie Laurencin, subtle in design, exquisite in color, is essentially feminine in spirit and conception, such as no man could have produced. That of Elizabeth Fuss-Amoré is very rich in color and subtly personal.

As a reaction against the flat surfaces of impressionism, cubism is concerned particularly with the expression of bulk and solidity. This it does by means of colored cubes and cylinders, following the dictum of Cézanne: "Nature can be expressed by the cube, the cone, and the cylinder. Anyone who can paint these simple forms can paint nature." It is an art of organized space, linear form, movement, and color, dissociated from the actual appearance of things. The influences which contributed to its formation were Cézanne (q.v.), Seurat, the pointillist, and especially Negro and Polynesian sculpture. Matisse gave it its name and aided at its formation in 1908, but the real founder and leader had been and still was Pablo Picasso (born 1881), a Spanish sculptor. He was the author of its conventions, such as the guitar, clay pipe, the bottle of alcohol, printed letters, etc. He has well been called "the chameleon artist," as he has worked in many different manners, with cubism as a phase of his development. His color, at first sombre, had finally become frank and clear. Georges Braque was the purist of the group, a logical, rigid cubist; Fernand Leger represented

the mechanical aspect. Albert Gleize, a facile writer on cubism, was painting in two rather than three dimensions, while Jean Metzinger was an orthodox cubist of the cylinder and cube variety. Among other followers of the movement were Auguste Herbin, André L'Hôte, half cubist, half realist; Jacques Villon; Marcel Duchamps, and François Picabia. Two poets, Guillaume Apollinaire and André Salmon, belonged to the cubist group and wrote in its interest. The influence of cubism, wide and in some respects wholesome, was in the direction of solidity and expression. Many painters in different lands experimented with and to some extent adopted it; but, in its rigid form, cubism is on the wane. Picasso's later works were more representative, under the influence of Ingres, and the tendency of the younger generation is to modify its austerities in the direction of romanticism—a distinct improvement. Among the most important of the younger men in Paris is Giorgio De Chirico, born 1888 in Greece of Greek parents resident in Italy. Influenced in youth by Böcklin, after passing through a youthful romantic period, he emerged as *surréaliste*. His art is mystic and symbolic, but with strange realistic effect, and his Greek origin is evident in the subject and spirit of most of his works.

There had latterly been many secessions from cubism, mostly ephemeral, such as Orphism and synchronism, which are concerned with arrangements of color irrespective of volume or actuality, and Dadaism, founded in Switzerland in 1917, by Tzarra, a Rumanian. This form of presentation, which had followers in France and Germany, is a kind of skepticism in painting, and was followed by others equally grotesque, and directed especially against cubism. It clears away the past and is satirical in character, better adapted to cartoons than to paintings, but is no longer of importance.

Italy. A later and more radical movement, futurism, forms Italy's peculiar contribution to modernism. It began as a protest of a band of young writers, painters, and sculptors against the idea that their country was nothing more than a vast museum of the past. Unlike the other modernists, the futurists break utterly with the past and look only toward the future; hence their name. The function of painting as they see it is to represent movement and growth, the dynamic forces of modern life. Many of their paintings bear the title "Dynamics" of this or that subject. As their manifesto put it: "We must make a clean sweep of all hackneyed subjects and express henceforth the whirlwind life of our day, dominated by steel, egotism, feverish activity, and speed." This they often seek to accomplish by means not unlike those of cubism, combining in the canvas not only what the artist sees but all he knows about the subject. A typical futurist feature is the use of so-called "force lines," certain linear rhythms whose convergence or divergence conveys to the artist the dominant thought or emotion he wishes to express. Color is purely arbitrary and may be used to heighten the effect. So may all manner of extraneous objects, which are simply pasted onto the picture. Futurist art indeed is cinematographic, except that it tries to show all at once what the moving picture unfolds in a given space of time.

The founder of the movement was the poet Marinetti, who wrote its eloquent manifestoes.

BORIS ANISFELD—Scene I. Act IV. "LE ROI DE LA HORE"

From 1910, when their first exhibition was held at Milan, to 1924, Luigi Russolo represented futurism in its most logical form. Umberto Boccioni, also a sculptor, was an able theorist on aesthetics, whose paintings are often of interesting design. Gino Severini was the illustrator of futurism, Carlo Carrà, its most genuine painter, who, unlike the others, uses gay color. Giacomo Balla's work is merely pretty. Many of the cubists were influenced by futurism and experimented with it, and vice versa. It had won but few new disciples and seemed destined to decline.

Great Britain. The latest effusion of modernism, vorticism, is a product of conservative Great Britain; but, before examining it, a brief survey of recent British art should be made. Although the chief influence was French, impressionism in its pure form never played a great part in Great Britain. It was rather the modified form of early impressionism, as introduced by the American Whistler during his long residence in London, which prevailed. This was concerned rather with decorative and tonal effects than with the pure study of light, especially in the case of the Glasgow school, out of which came Sir John Lavery (born 1856), especially known as a portraitist. The methods of the brilliant Irish painter, Sir William Orpen (born 1878), are more akin to impressionism, while Augustus John, a Welshman (born 1876), in his powerful characterizations, tends rather to modernism. Mention also should be made of two Americans, active in London, John Singer Sargent (1856-1925), whose superb technique combined realism with impressionism, and James J. Shannon (1862-1923), whose illustrative art ranges him properly among British painters. Frank Brangwyn (born 1867) represented rather the realistic point of view in his superb decorations for the Panama-Pacific Exposition and the Missouri State Capitol. The powerful individual landscapes of P. Wilson Steer show a transition from impressionist to modernist technique. An important figure in the introduction of French post-impressionism into England was Roger Fry, especially by his writings and exquisite connoisseurship. It was mainly the influence of Cézanne and Van Gogh that made itself felt and the aim was greater plastic effect but with more reference to nature than in France. Among the leaders were Spencer F. Gore (1878-1914) and Harold Gilman (1878-1919), who tended more strongly toward modernism, and Charles Ginner.

According to the theory of vorticism, "every concept, every emotion, presents itself to the vivid consciousness in some primary form. It belongs to the art of this form." The "vortex" is the artist's faculty through which the emotions and conceptions pass to take concrete shape on canvas. Through it, they pass from the general to the concrete. In common with post-impressionists, vorticists do not reject the old masters; but they agree with the futurists that modern art should reflect present-day industrial civilization, with its dominance by the machine. Their paintings are in general geometric and abstract, not unlike cubism. Their aim is to purify painting, and they rely especially on the primary pigment of their art, resembling in this regard the Orphists and synchronists. There was nothing essentially new and original in their art, which began in 1913, although several interesting painters had taken

it up. The founder and principal leader was Wyndham Lewis (1884-), with whom were associated Cuthbert Hamilton, Frederick Etchells, Edward Wadsworth, and William Roberts. The poet of vorticism was an American, Ezra Pound; the sculptor was Henry Gaudier-Brzeska (1891-1915). Vorticism was also a passing phase in the development of C. R. W. Nevinson, who experimented in other styles, including cubism and futurism, only to return in his later work to a more conservative academic art.

During the War, the British government made the interesting experiment of employing several painters at the front, and many of their pictures were purchased by the Imperial War Museum. Most of the men employed were actually engaged in warfare and so painted from experience, as well as observation. In the choice of artists, a wise eclecticism was followed; not only accepted academicians but the most radical groups were included. And it was just these radicals whose art seemed especially adapted to the mechanical character of modern warfare. Among the most prolific of war painters was Sir William Orpen, a major in the army, whose portraits of the chief commanding officers are well known; James McBey, official painter of the Army of the Near East; George Clausen, and Augustus John, who painted important commissions for the Canadian government. The futurist technique of C. R. W. Nevinson grappled most successfully with searchlights, shells, and especially aeroplanes. Paul Nash, a visionary post-impressionist, depicted what might be called nature's "dance of death," while vorticism, through its leaders, Wyndham Lewis and William P. Roberts, showed itself well capable of representing the dynamics of modern warfare. All these artists wisely confined themselves to episodes of warfare and did not attempt battle paintings on a grand scale. One of the few good results of the War was the destruction of the old-fashioned battle picture, with its photographic detail, most characteristically seen in the works of Meissonier. The modern battle extending along a front of many miles cannot be painted. The brave array of soldiers has been replaced by the invisible crowds of the trenches. The brightly colored uniforms are now sombre browns, grays, and greens, and the modern soldier is little different in aspect from a workman. (See *War Paintings and Drawings*, by British artists, New York, 1919; and Charles Holme, "The War Depicted by Distinguished British Artists," in *The International Studio*, 1918.)

Germany. The World War and the succeeding years levied a heavy death toll on the painters of Germany. At the close of the period 1914-29, many of the older men were still active in the manner of their earlier work; Edward Gebhardt, religious painter, at Dusseldorf; Arthur Kampf, realist, at Berlin, and Max Liebermann, chief representative of impressionism and leader of the North German secessionists, also in Berlin; but these have since died. In Munich, the "decorative school," led by Franz Stuck, was somewhat akin to modernism in its realistic representation of mystic and allegorical subjects, inaugurated by Böcklin; but even this was considered conservative and official a little later. Impressionism was an importation which never secured a firm foothold in Germany. The native tendency was all toward its antipode, expressionism, for which the soil was well prepared by earlier painters. In the early sixteenth century,

Matthias Grünewald distorted nature to express emotional mysticism much as El Greco did later in Spain. Hans von Marées (1837-87), rebelling against realism and early impressionism, sacrificed the appearance of things to volume and symbolic expression, in his noble decorative figures. The Swiss, Ferdinand Hodder (1853-1918), a powerful and arbitrary painter, developed in his later works a thoroughgoing expressionism. The influence of Cézanne, Van Gogh, and to a less extent Gauguin was early felt in Germany; but it was an exhibition of the works of the Norwegian, Edvard Munch, in Berlin which caused the separation of the new movement from the Berlin secession. Cubism and futurism never obtained an important following, for the principal German tendency was toward forms of purer expressionism. There were two chief groups, at Berlin and Munich. The former group was the less radical. The facile and decorative art of Max Pechstein is more akin to the post-impressionism of other lands, and so is that of Albert Werszgerber and Carl Caspar, all of whom were influenced by Cézanne. Among the members of a more radical group at Berlin called "Die Brücke" were E. L. Kirchner, its founder, a visionary who changes city scenes into fairyland; Erich Heckel, a painter of landscapes romantic in subject; Karl Schmidt-Rottluff, whose tendency is to the colossal and even brutal; and Otto Müller, who prefers rather lyric subjects, painted in tempera.

At Munich, Russian artists contributed to produce the most radical type of expressionism. Foremost among them was Wassily Kandinsky (born 1886), a theorist who writes as well as he paints. He maintains that the rhythm of line and color and of color in juxtaposition to color should be built up architecturally, on fixed principles of construction, as in music. Such an art appeals to the eye, independent of all representation, very much as music affects the ear. His pictures are arrangements of abstract line and color without attempt to represent nature. It was he who with a few others seceded from the other post-impressionists to form the group called, from its publication, "Der blaue Reiter." An important member of this group was Franz Marc (1880-1916), who painted impressions of animals in symbolic color. Others are Baroness Werefkin, Auguste Macke, Gabriel Muntz, Adolf Block; Heinrich Camperdonck, whose quaint presentations of village and other subjects are essentially imaginary and unreal; Oskar Kokoschka (born 1886), an Austrian painter, the most radical and perhaps the most powerful of all, less abstract, but equally eccentric, and powerful to the point of brutality; and also Emil Nolde and Carl Hofer, both at Berlin, who paint in a similar vein. Another Berlin painter, George Grosz (born 1893) passed through various stages, including Dadaism, to become an ironical observer of society from the Marxian point of view, especially in his lithographs. Jules Pascin (born 1886), a Bulgarian, a clever and delightful draughtsman and painter, is well known in the United States for his Negro and similar subjects, painted in Florida and Cuba.

Russia. At the outbreak of the War, the Russian school of painting was of great importance and promise. Two factors contributed to make it unlike any other school: stage decoration and peasant art. The unparalleled success of the Russian ballet in Europe and

America was due as much to its artistic settings as to superb dancing. Of unprecedented power and imagination, these decorations were all the work of Russian painters. Diaghilev (died, 1929), one of this St. Petersburg group, was the pioneer and the greatest painter-impresario in dramatic history. Other great designers were the painters Benois, Golovine, Léon Bakst, Anisfeld, and Larianov. The astonishing freedom of presentation in modern Russian painting and its highly imaginative and decorative qualities were due largely to this training. It was also profoundly affected by the pure, bright color schemes and the picturesque settings and costumes of native peasant art, and on its imaginative side by a vital school of book illustration, particularly of folk tales and subjects. The most important reaction against the realism of the Wanderers, chief of whom was Ilya Repin, was the "Mir Iskousstva" (Artistic World) at Leningrad. Unlike the former, which painted Russian contemporary life, this group sought subjects in the past, was cosmopolitan in character, and showed French influence. Alexander Benois chose the age of Louis XIV in France and that of Elizabeth in Russia; Constantine Somov, the period of 1830; Nicholas Roerich, the Viking age and, after his removal to the United States, Oriental subjects, especially Chinese and Tibetan. The Moscow group was less learned and more pictorial and chose Russian subjects. Its best-known representatives are Igor Grabar, a *pointilliste*, an influential figure in Soviet Russia, and especially Malavin, who depicted the gay, animal side of the Russian moujik.

Meanwhile, various modernist tendencies had appeared in Russia, and their influence was beginning to be felt. The War put a stop to painting, and during the revolution and the years following most of the artists emigrated from Russia, chiefly because the wealthy class which patronized art had ceased to exist. They migrated to different centres, many joining the large Russian art colony in Paris, where they maintained their vital national art. Exhibitions of their works were held at various places in the United States. The exiles, who in Paris kept up their national art, included Fehin, a pupil of Repin, Choukhaiev, Jakolev, Sorin, a rather conservative portraitist, Soudeikin, Stelletski, Burlin, and especially Boris Grigoriev, whose apocalyptic hallucinations of the Bolshevik Revolution and representations of the Russian populace, particularly on their brutal and bestial side, caused a sensation. Best known in the United States was Boris Anisfeld, who exhibited repeatedly in New York and in other cities.

In Russia itself, the revolution wrought little damage to existing art works. The more important public museums, such as the Hermitage in Leningrad and the Tretykov Gallery in Moscow, were greatly enriched by the confiscation of private collections; and the Imperial and other important palaces were transformed into museums. Throughout the length and breadth of the land, new museums were established. The successful management of public art institutions, which was conceded to be better than ever before, was due to the efforts of Lunacharski, Minister of Public Instruction. One of the daring schemes of Soviet Russia is the establishment of a new proletarian art. Rejecting cubism and futurism as bourgeois products, they acclaimed a new art, "suprematism," which denied not only all representation but even the styliza-

tion of natural forms. Kandinsky, whose art most approached this norm, was called from Munich to aid in its establishment, as well as in that of the provincial museums. Official exhibitions of Bolshevik paintings were held at Berlin in 1923, New York, 1929, and elsewhere. It was about the most modern exhibition ever seen. The paintings were usually labeled "constructions" or "compositions" and were built up mathematically. Simplification went even beyond Kandinsky's in the works of such as Malevitch and Robchenko. Everywhere, the search for new forms of art was in evidence. There were also many works of a more conventional character, and the impression of the whole was that of a living and vital art of telling forms and splendid color. Whether such modernist paintings fulfilled the requirements of a Soviet art as enunciated by Kamenov, "an art comprehensible to workmen and to peasants," is another question. In subject, it is indeed proletarian, but representation was confined almost to posters and black and whites.

Other European Countries. The virile national impressionism of Sweden suffered great loss in the death of its two chief representatives, Anders Zorn (1860-1920) and Carl Larsson (1853-1919). Luliefors painted wild animals, and Gustav Fjaestad painted snow and water scenes in *pointilliste* technique. Zorn's successor in painting the Danecarlian peasantry was Mas Olle, another good portraitist. Sweden had also its due proportion of modernists, such as Axel Torneman; Gabriel Strandberg, who painted the outcasts of Stockholm; John Bauer, whose quaint imagination found expression in fairy tales; and Össian Elgström, with a touch of the Laplander.

The dominant figure in Norwegian art was Edvard Munch, who was also something of a modernist, influenced somewhat by Cézanne. Ludvig Karsten was his most prominent follower. The foremost talent of the neo-impressionist group was Hendric Lund, while Sören Ansorger was known for his nudes. Norway also had its expressionist cult, influenced chiefly by Matisse; among its foremost representatives were Hendrik Sørensen and Axel Revold. The painting of Denmark was more conservative, although modernism had its representatives.

Belgium and Holland were strongly affected by the new movement, especially Holland. In a country which in its art had been so closely attached to the past and was realistic in character, it was astonishing to what extent the new movement had spread. Although Van Gogh, one of its chief pioneers, was a Dutchman, his last and most radical works were painted in France, and his influence entered Holland quite late; nevertheless, it was powerful. Among the chief representatives of the new development were Jan Toorup, Thorn-Prikker, Willem van Konijnburg, J. J. Isaakson, and Jan Sluyters.

The death of Sorolla in 1923 removed the foremost representative of impressionism in Spain. The most interesting manifestation of contemporary Spanish painting was the nationalist school of the North, founded by Zuloaga and ably seconded by numerous followers, including the Zubiaurre brothers. In subject and treatment, it was thoroughly national and continued the traditions of El Greco and Goya. It was a school decorative in style, with heavy outlines, rich, sombre color, and vivacious expression.

United States. Since 1914 American painting has followed a normal development, less changed by recent radical tendencies than other important schools. It was also less affected by the World War. During the early years of the conflict, artistic production was in no wise curtailed, and it was not until after the entry of the United States in 1917 that there was any perceptible diminution in the output. There was comparatively little painting of war subjects. The death toll among older American artists during the period was heavy. To mention a few of the most prominent, William Merritt Chase and Thomas Baskins died in 1916; Albert Ryder and Carroll Beckwith in 1917; Henry Golden Dearth in 1918; C. Y. Turner, Frank Duveneck (q.v.), Ralph A. Blakelock, James Alden Weir, and Kenyon Cox in 1919; Abbott H. Thayer and J. Francis Murphy in 1921; Hamilton Easter Field in 1922; Elihu Vedder, Joseph R. Decamp, Max Bohm, Paul Cornoyer, and George W. Maynard in 1923; D. Ridgeway Knight, Thomas Allen, and Jay Hambridge in 1924; John Singer Sargent, Henry Reuter Dahl, and George Bellows in 1925; George Inness, Jr., Joseph Pennell, Thomas Moran, Mary Cassatt, and Ben Foster in 1926; Edward Henry Potthast and Frederick Melville Dumond in 1927; Harry Siddons Mowbray, Arthur B. Davies, Frederick S. Lamb, and Warren Davis in 1928. The former radicals of the Society of American Artists were the conservatives of the day, and even those of the next younger generation were now among the elect. All these continued their work, and many figured at the exhibitions and as medalists, such as Douglas Volk, Irving Wiles, Dewitt Lockwood, Cecilia Beaux (q.v.), Mary Cassatt, Frank Benson (q.v.) and Edmund C. Tarbell, among portraitists and figure painters; Waugh, Woodbury, and Emil Carlsen, as marine painters, the last especially taking many medals in the later years for marines and still life; Edward Redfield, Elmer Schofield, and Gardner Symonds, as painters of winter subjects; and Childe Hassam (q.v.), most pronounced impressionist among the older men.

Arthur B. Davies, (q.v.), known as leader of the modernists, continued his idyllic subjects with no end of variety and charm until his death in 1928. In the years following 1914, he passed through a cubist period, which added volume and construction to his rather decorative art but never exercised a dominant influence. So also did Robert Henri (q.v.), whose virile production and influence continued almost undiminished. Of his former pupils, George Bellows (1882-1925; q.v.), achieved great distinction through his bold and powerful portrait and figure subjects, which won medal after medal. Other important members of this group were George Luks, William Glackens, John Sloan, and Eugene Speicher. Powerful alike in characterization and technique are the portraits by Leopold Seyffert and those by Wayman Adams. Other portraitists known also as figure painters were John C. Johansen, Karl Anderson (q.v.), Joseph Pearson, Jean M. Lane, Louis Betts (q.v.), Leon Kroll, and Henry R. Rittenberg, also a consummate master of still life.

In the first rank of American figure painters was Charles W. Hawthorne (q.v.), who paints the inner life with beautiful and highly characteristic color. Of pronounced impressionistic technique among the younger men were Richard Miller, Frederick Frieseke (q.v.), and James

Weiland. Another characteristic branch of American painting is Indian subjects. The Taos group of painters, so called from their place of residence in New Mexico, in recent years painted many interesting representations of Indians, chiefly of the Southwest. Among their number were Julius Rolshoven, Carl Rungius, Walter Ufer, Ernest L. Blumenschein, Edward Potthast, and O. E. Berninghaus. Their work was generally impressionistic or realistic in character and of fine illustrative quality. The production of mural paintings has continued with unabated regularity. Among the most important series were the decorations of the Boston Museum of Fine Art, by John Singer Sargent (1856-1925); a series of 116 panels, the "Opening of the Book of the Law," by Violet Oakley (born 1874), in the Pennsylvania State Capitol at Harrisburg; and Augustus Tack's decorations of the governor's suite in the Nebraska State Capitol at Lincoln (1927), entitled "The Virtues of the Human Race," in a novel style reminiscent of Greek vase painting. Robert Chanler is known for his screens showing Chinese influence but independent and modernistic in conception and execution, and Arthur Crisp for various mural paintings.

Landscape painters among the younger generation were many. One of the strongest was Ernest Lawson, whose winter scenes are particularly fine. These subjects were preferred also by John Follinsbee and by Charles Rosen, who afterward changed his style in accordance with the modernist formula. Jonas Læ painted landscapes, industrial scenes, and, lately, marines, and Gifford Beal (q.v.), brightly colored landscapes, while Guy Wiggins was more tonal. Among the marine painters, Paul Dougherty painted the Maine Coast with powerful effect, and William Ritschel the Pacific, brilliantly and with versatility, while Hayley Lever was known especially for his boats, though he later painted varieties of landscapes with equal ability.

The entry of the United States into the World War had small permanent effect on painting. Among pictures intended to fire patriotic endeavor, the best known is "Carry On," by Edwin Blashfield (Metropolitan Museum, New York). An interesting series by Childe Hassam depicted Fifth Avenue in war time. An important series of war portraits, authorized by the National Art Commission and paid for by subscriptions in the principal cities of the United States, was presented to the National Museum at Washington. They were exhibited at the Metropolitan Museum in New York City in 1921; all were by painters of conservative tendencies. The most important was a large picture, "Signing of the Treaty of Versailles," by John C. Johansen. The others were portraits of the chief war celebrities of all the Allies, by Cecilia Beaux, Jean McLane, Joseph Decamp, Charles Hopkinson, Edmund C. Tarbell, Douglas Volk, and Irving R. Wiles. Another series presented to the National Museum consisted of portraits of Americans prominently identified with the War. Several of these were painted by J. H. von Rehling-Quistgaard, an able painter of rather conservative tendencies.

The brilliant success with which modernism was launched in New York and Chicago in 1913 gave great promise for the future of the movement; but this promise was not realized. Factional differences soon disrupted the International Association of Painters and Sculptors, which had organized the exhibition; and beyond

separate exhibitions of smaller groups, little was heard of the new painting. In 1917 the Society of Independent Artists was founded with unrestricted membership to anyone paying the nominal initiation fee. Each member is entitled to send a limited number of paintings or sculptures to the annual exhibition. As there was no jury of acceptance and the paintings were hung in alphabetical order of authorship, these exhibitions presented a strange medley of pictures excellent and worthless, academic and modernist. Nevertheless, they formed an open forum, uncontrolled by official juries, for the radicals. The most interesting feature in the later years was the work of a group of native Indian artists, without technical training and therefore modernist enough. Their chief subjects were Indian ceremonial dances, painted in pure, bright water color. Modernist paintings were on constant exhibition at certain of the dealers', and in such altruistic institutions as the Intimate Gallery, conducted by the distinguished artist-photographer, Alfred Stieglitz, and the Société Anonyme, founded by Katherine Dreier—both in New York.

A very important event was the official recognition of modernism by the National Academy of Design in whose Spring Exhibition of 1927 modernist pictures were not only admitted but predominated. Among painters of modernistic tendencies were Rockwell Kent (q.v.), especially in his Labrador subjects; Kenneth Hayes Miller, of much influence as a teacher, Maurice Sterne and Max Weber, both admirable teachers; Andrew Dasburg, a follower of Cézanne, Samuel Halpert, and Henry McFee; Walter Pach, a cubist still-life painter; Abraham Walkowitz, an able draughtsman, William and Marguerite Zorach, and most important of all, John Marin, whose water colors are generally accepted. He is a painter of startling originality and real creative genius. Distinctly creative also, and very original are the flower paintings of Georgia O'Keeffe. More cosmopolitan and less distinctively American than the two just mentioned are Marselen Hartley, Arthur G. Dove, Charles Demuth, S. McDonald Wright, Thomas Benton, Preston Dickinson, and Kuniyoshi, a Japanese who paints Western life with strange Oriental vision. Other representatives of modernism are Oscar Bluemner, Charles Sheeler, Walt Kuhn, Alfred Maurer, Peggy Bacon, Ben Bann, John Covert, A. S. Baylinson, Man Ray, Morgan Russell, Jay Van Everen, James Daugherty, and Henry Fitch Taylor. A new and interesting figure (1928) is Emil Ganso, born in Germany and self-educated in spare moments of a baker's labor. An original and powerful draughtsman, he excels in engraving, etching, and lithography, as well as in painting. The foremost representative of futurism in the United States was Joseph Stella, who with rare ability depicted the Brooklyn Bridge, the subway, and other characteristic features of New York.

Mexico. The 1928 revolution in Mexico brought in its wake an amazing development of mural painting by Diego Rivera, a native Mexican, and his followers. Schooled in Mexico and in Europe, where he was prominent as a modernist, he returned home to establish a truly national art. His mural paintings in the National Preparatory School, entitled "Creation" (1927) and executed in encaustic, symbolize the formation of the Mexican people. Those of the patio of the Ministry of Public Education upon

which he is still engaged (1929), symbolizing native agriculture, industries, and arts and crafts, are grandiose and elemental in style and technique. They are painted *al fresco* by an ancient Mexican process in which the colors are mixed with the juice of leaves of the prickly pear, forming a soft smooth surface of dull lustre, but clear, distinct color.

PALACIO VALDES, pā-lā'thiyo val-dās', ARMANDO (1853-). A Spanish novelist (see VOL. XVII). His later works include *La guerra injusta* (1917), and *Años de juventud del doctor Angélico* (1918).

PALEONTOLOGY, PALÆOLITHIC CULTURES. See ANTHROPOLOGY.

PALEOLOGUE, pā-lā'ō'lōg', MAURICE GEORGES (1859-). A French diplomat and man of letters (see VOL. XVII). He was Ambassador to Russia during the World War until May, 1917, and then returned to the Quai d'Orsay. On the resignation of Berthelot as director general of the Foreign Office, Paléologue succeeded him, in December, 1921, and served until 1925. In 1927 he was elected to the French Academy. His *An Ambassador's Memoirs* (3 vols., trans. 1923-25) throw a vivid light on the decomposition of the Russian Empire under the stress of the War. His other later works include: *The Romantic Diplomat* (1924, trans. 1926); *Carour* (1926, trans. 1927); and *The Tragic Empress; Intimate Conversations with the Empress Eugénie* (1901-19) (1928).

PALESTINE, pāl'ēs-tin). A British mandate territory and the Jewish national homeland, since July 1, 1920, under a civil administration. It includes that part of historic Palestine which lies to the west of the Jordan and which before the World War was a vilayet of the Turkish Province of Syria. Area, estimated at 10,000 square miles. The population, according to the census of Oct. 23, 1922, was 757,182, comprising 590,890 Moslems, 83,794 Jews, 73,020 Christians, 7028 Druses, 163 Samaritans, and 265 Bahais. The estimated population July 1, 1927, 882,000, included 648,556 Moslems, 147,687 Jews, and 76,839 Christians. The capital, Jerusalem, had a population of 62,678. Other principal cities are (populations in parentheses): Jaffa (47,700), Haifa (24,634), Gaza (17,480), Hebron (10,577), Nablus (15,947). Jewish immigration, which was resumed after the War, totaled 130,000 by Mar. 1, 1928, in 1927 immigration totaled 3395, while the emigrants num-

bered 6978. Jaffa is the principal port of entry; the immigrants came largely from Poland, Russia, Morocco, Austria, Syria, Bulgaria, Rumania, Egypt, Hungary, etc. Moslem interests are represented by a Supreme Moslem Council; Jewish interests are the concern of the Palestine Zionist executive.

Jewish Colonies. These colonies, totaling 115 in number, are grouped in four districts, viz., Judæa (43), Samaria (18), Lower Galilee (43), Upper Galilee (11). The colonies possess schools, synagogues, public libraries, hospitals, and baths. By the end of 1927, the total population of these colonies numbered more than 32,000 and the lands which they worked included some 267,000 acres. The colonies are owned or established by the Jewish National Fund, the Palestine Land Developing Company, Baron Edmund de Rothschild, and the Jewish Colonization Association. Tel Aviv, near Jaffa, founded by Jewish colonists in 1909, has a population estimated at 15,000 to 20,000.

Education. In 1927 there were 314 government schools. The Christian and Jewish children attended non-government schools. Christian schools numbered 183 (15,145 pupils), the Jewish schools 255 (26,481 pupils). There are Jewish high schools at Jerusalem and Jaffa, three teachers' training colleges, schools of music at Jerusalem, Jaffa, and Haifa, and a technical college at Haifa. In all these, Hebrew is the medium of instruction. The majority of the non-government schools were receiving state aid. There is a Hebrew University in Jerusalem, which was opened in 1925.

Industry. The productive portion of the country is the narrow strip of plain running along the Mediterranean from Gaza to Haifa. The richest region, in the neighborhood of Jaffa, was developed by Jewish colonists who carried orange and lemon cultivation here to a high degree of production. In 1927 crop production was wheat, 90,406 tons; barley, 44,524 tons; durra, 37,441 tons, olives, 1866 tons, lentils, 3155 tons. There was in the country the following live stock: 242,625 sheep, 385,762 goats, 22,569 camels, 596 buffaloes. The orange crop, which constitutes the principal export item, totaled 2,214,000 cases during 1926-27. Mineral resources include sulphur, iron, coal, salt, limestone, sandstone, and gypsum. The Government is applying itself to reforestation and the reclaiming of the dunes. Trade, carried on largely through the ports of Jaffa, Haifa, and Gaza, consisted of imports of \$31,339,416 in 1927; exports, \$9,251,400. The chief articles of export are oranges, soap, melons, wine, apricot paste, and almonds; the chief articles of import are cottons, cigarettes, sugar, petroleum, and rice. The principal countries of origin in 1927 were Egypt, the United Kingdom, Syria, and Germany. Exports went to Egypt, Syria, and Great Britain. Imports from the United States were valued at \$1,335,400 and exports to the United States amounted to \$231,000.

Finance. Receipts for 1928 were estimated at £P2,322,935 and expenditures at £P2,443,677 (the new Palestine pound is equivalent in value to the pound sterling). The revenue was derived principally from: customs, £P750,000, port and marine, £P5200; licenses, taxes, etc., £P740,400; fees of court, etc., £P215,200; posts and telegraph, £P176,850; railways, £P368,000. A new currency, based on the pound sterling, was introduced on Nov. 1, 1927, and is guaranteed by

both the British and Palestine governments. The Palestine pound, as the new unit is called, is divided into 1000 mills, and replaces the Egyptian currency hitherto in circulation. The exchange of currency was completed Mar. 31, 1928.

Railways. There were in operation in 1928 737 miles of railways, of which 612 miles were being operated by the government of Palestine, and 125 miles by the Palestine Railways and the British Air Ministry. The most important lines are the Kantara-Ilaifa (250.5 miles), Jaffa-Jerusalem (54.2 miles), Rafa-Beersheba (37 miles).

Government. By the constitution of Sept. 1, 1922, executive power was vested in the High Commissioner, appointed by Great Britain. A legislative council, of 10 official members and 12 unofficial, of which at least two were to be Christians and two Jews, was given the power to legislate for the mandate territory. The High Commissioner might veto any ordinance, or the British government might disallow it. By 1929 the Legislative Council had not yet been convened because of the abstention of the Arabs from the polls. The Jews chose an elected assembly, which in turn appointed a national committee to treat with the Palestine government. The British mandate for Palestine was approved by the League of Nations Council on July 24, 1922, and was promulgated on Sept. 29, 1923. On July 1, 1920, Sir Herbert L. Samuel became High Commissioner. He was succeeded on July 1, 1925, by Field Marshal Lord Plumer, who was followed on July 6, 1928, by Lieut. Col. Sir John Chancellor. See also JEWS AND JUDAISM; ZIONISM.

History. By the secret Sykes-Picot Agreement of May 16, 1916, France and England had agreed that the ports of Haifa and Akka in Palestine should be assigned to Britain, and that Palestine as a whole should be "separated from Turkish territory and subjected to a special régime to be determined by agreement between Russia, France, and England." Not content with this ambiguous pledge, the British government manoeuvred to obtain sole jurisdiction over the region. Of fundamental importance in this British move was the celebrated Balfour Declaration of Nov. 2, 1917. This utterance pledged the British government to "establishment in Palestine of a National Home for the Jewish People . . . it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine or the rights and the political status enjoyed by Jews in any other country."

The British policy set forth in the Declaration proceeded from two motives. As a war measure, the Declaration was calculated to win the international Jewry to the cause of the Entente. Of much greater importance, however, was the knowledge that Palestine had been from time immemorial the connecting link between Mesopotamia and Egypt and that it was the strategic point which potentially controlled the road to India by land and by sea. The establishment of a Zionist state under British protection gave Great Britain this coveted possession, and, while it cemented the foundations of the British Empire, homage was done at the same time thereby to the Allied slogan of "self-determination of nations." The British project, a combination of altruism and imperial *Realpolitik*, had some serious drawbacks which had been left out of

consideration. First, modern Palestine was not a Jewish country. Secondly, Arab nationalism, of which Great Britain itself had been the chief instigator during the War, was naturally opposed to the whole idea. Finally, Palestine was not only the natural link between Mesopotamia to the northeast and Egypt to the southwest, but it was also at the mouth of a great reservoir of Arab man-power to the south. The attempt to close this outlet by an artificial Jewish state under the protection of the British Empire was naturally fraught with danger, and all the more so since the Balfour Declaration conflicted, in the opinion of the Arabs at any rate, with the British commitments to the Sherif of Mecca in 1914 and 1915.

Palestine was in an exhausted condition. The land was untilled and production had fallen to a low ebb. The population had decreased considerably during the War and the whole system of civil government had fallen to pieces. Immediately after the occupation, the British set up a military administration which after much effort succeeded in bringing about an improvement. Gradually, cultivation was restored and normal life began to return, but much more had to be accomplished. Palestine had always been undeveloped and underpopulated under Turkish rule, and the British aim was to bring out the great latent fertility of the country. As for the Jewish population, which had been very small during the nineteenth century and had risen to about 100,000 before the War, it formed in 1918 only a fraction of a total population which was predominantly Arabic.

On Sept. 27, 1919, Zionism, which had been a force in the Jewish world for some time before the War, pleaded its case before the Supreme Council and asked for the recognition of the historic title of the Jews to Palestine and for the right to reestablish there a national home. Furthermore, the Jews requested that Palestine be assigned to Great Britain as a mandate. After a long delay, during which the first manifestations of Arab national sentiment against this proposed settlement occurred, the Supreme Council at the Conference of San Remo, Apr. 25, 1920, granted the mandate to Great Britain and in July of the same year the military administration was replaced by a civil régime under Sir Herbert Samuel, a prominent English Jew, as High Commissioner. In October, 1920, an advisory council was set up, consisting of 10 officials of the administration, 4 Moslems, 3 Christians and 3 Jews. Much attention was given to local government and 22 municipalities and 14 local village councils were established. As for education, the Turkish system was reorganized and extended. The Moslem children attended the government schools where Arabic was the principal medium of instruction, but most of the Jewish children went to schools conducted by the Zionist Organization and the Christian children attended the schools maintained by the ecclesiastical and charitable bodies. Considerable progress was made in the direction of public health and sanitation. The law of the land was in substance that of the Turkish code. The abolition of the Capitulations, which had been decreed by Turkey at the outbreak of the War, was maintained, except in the case of the United States. Foreigners were tried by a British magistrate or by a court with a majority of British judges. Public security was maintained by a police force and gendarmery recruited from all sections of the population.

The Zionist claims to Palestine were recognized in the Peace Treaty of Sèvres, and the Balfour Declaration was incorporated in the text of that document. After much contention between the English and the French over the boundaries between Palestine and Syria, a convention defining these was signed on Dec. 23, 1920. A final agreement relative thereto was concluded on Feb. 3, 1922. The draft for the Palestine mandate was submitted to the League of Nations on Dec. 7, 1920, and approved in July, 1922. Its promulgation was delayed, however, due to the opposition of the Italians to the French Syrian mandate with which the Palestine mandate was bound up. The mandate realized practically all the demands of the Zionists at the Paris Conference in 1919. The region to the east, known as Transjordan, was under the authority of the High Commissioner, but was not included in the area of the Jewish National Home. Subsequently, Abdullah, son of the King of the Hedjaz, was established as Amir of this region.

Meanwhile, the nationalist sentiment of the Arab majority chafed against these arrangements. Serious riots took place in Jerusalem in April, 1920. In February, 1921, a congress of the Palestinian Arabs was held, at which protests were registered against the Balfour Declaration and demands were made for a national government and a legislative assembly to be elected by the Arabic-speaking population residing in the country before the War. A permanent committee was set up to work in this direction. On May 1, 1921, the anti-Jewish feeling manifested itself in widespread disturbances in the course of which military force had to be employed to restore peace. This led to a thorough investigation of the affairs in Palestine by a commission, in the report of which the Arab grievances were analyzed and both sides were exhorted to refrain from all expression of extremism and to work in a spirit of moderation for a lasting understanding and for the development of the country, but the report upheld the policy of the Balfour Declaration and said nothing which could allay the apprehensions of the Arabs. In order to settle the difficulties, the British government drafted a constitution for Palestine, the chief provisions of which were given to the press in February, 1922. According to this document, supreme executive authority was to be vested in the High Commissioner, who was to be assisted by an executive council. Provision was made for the establishment of the Legislative Council, to consist of 10 officials and 12 unofficial members, the latter to be elected under a system of primary and secondary elections. The acts of the Legislative Council were to require the assent of the High Commissioner or in certain cases that of the British government. In regard to the judicial system, provision was made for the setting up of separate Moslem, Christian, and Jewish religious courts with English, Arabic, and Hebrew as the official languages. The British government was to be the arbiter in complaints regarding nonfulfillment of the terms of the mandate, but the procedure in such cases was to be prescribed by the League of Nations.

After the publication of the draft of the Constitution, a delegation, claiming to represent the entire Christian-Moslem population of Palestine, went to England to protest against the provisions. The chief complaint of the Arabs centered on the limited self-government which was to be bestowed on Palestine and it was claimed

that such restriction was contrary to Article 22 of the Covenant of the League of Nations. The reply of the British government made clear that a different course and in particular the establishment of a national government was not open to Great Britain, since this would involve an abandonment of the pledge regarding a Jewish National Home. The British, in fact, could not repudiate the policy of the Balfour Declaration if they wished to retain their hold on Palestine. In view of the powerful possibilities inherent in Arab nationalism, it was doubtful whether an Arab Palestine would have been as pliable an instrument in British hands as a Jewish Palestine was. The Arabs, on the other hand, could not very well recede from their position of opposition to Zionist rule in view of the fact that the Jews constituted only a fraction of the total population of Palestine. According to the figures of the official census of 1922, which divided the population along religious lines, the total population in that year was 755,000, composed as follows. Moslems, 589,564; Christians, 73,026; Jews, 83,794; Druses, 7028; other religions, 1446. Most of the Christians spoke Arabic, were racially akin to the Arabs, and sided with the latter against the Jews.

A lengthy declaration of the British policy, issued in July, 1922, attempted to allay the apprehensions of the Arabs. It referred to these as "partly based upon exaggerated interpretations of the meaning . . . of a Jewish National Home in Palestine" and stated at the same time that the Balfour Declaration was "not susceptible of change." While the Zionist Organization declared itself satisfied with this declaration, the Arab delegation refused to accept it and returned home in the fall of 1922. Thereupon, the Arabs decided to boycott the elections for the Legislative Council which were held in the beginning of 1923. Sir Herbert Samuel then suspended the part of the constitution dealing with the Legislative Council and substituted an appointed Advisory Council. This Advisory Council, which was to consist of eight Moslems, two Christian Arabs, and two Jews, was, however, impossible of formation, because, under pressure from the Nationalists and particularly from the Arab delegation which had recently returned from London, most of the prospective members refused to serve on it.

Meanwhile, there were rumors of an agreement between Great Britain and the King of the Hedjaz under which Palestine was to become part of the domain of the latter. In spite of the Government's denial of the truth of these rumors, considerable excitement ensued and the Sixth Palestine Arab Congress, which met in June, 1923, found it necessary, in view of the conflicting opinions prevailing among Moslems, Christians, and Jews, to declare that it was opposed to any such course. After the Congress, another delegation was sent to London, which soon returned, its mission having been a failure. The confirmation in 1923 by the League of Nations of the British mandate for Palestine and the consequent legalization of the existing status failed to impress the Arab population, which continued its intransigent attitude. The Government's offer for the creation of an Arab Agency similar to the Jewish Agency meeting the adamant opposition of the Arabs, the Government proceeded to form an Advisory Council consisting of officials only. At the same time, a new moderate Arab Liberal Party sprang into existence, which, in spite of its opposition

to the old party, failed to evince much moderation in its programme. The year 1923 was marked by a final settlement of the frontiers of Palestine and Syria through agreement between the mandatory powers and by Great Britain's recognition of Abdullah's Transjordanian government as an autonomous state under British protection. See TRANSJORDANIA.

In 1924 the League Mandates Commission drew the attention of the League Council to the difficulty involved in trying to establish a Jewish National Home and protecting the rights of an overwhelming Arab majority in the same small mandate; but neither the Council nor England made a move at the time. Meanwhile, Jewish immigrants flocked into Palestine, chiefly from Poland and other parts of eastern Europe where they were being persecuted. The year 1925 saw 33,801 Jews enter the land, but this was an exceptional year. Many of the newcomers, however, found the agricultural labor so thankless and so utterly distasteful, that they left the country again. Thus, in 1925 the emigrants numbered 2141. In 1926 the number of Jews entering was 13,081, while over 9000 left, and in 1927 only 2713 came into Palestine, while 5071 went out. Naturally, the greater the number of Jews who entered the Holy Land, and the more they developed Jewish industries (e.g., the Palestine Electric Company), farms, and schools, the more bitter and resentful did the Arabs become. A constantly recurring series of crises was reached over the so-called Wailing Wall incidents. See ZIONISM.

The Wailing Wall supposedly was a relic of Solomon's Temple, and the Jews had an age-old practice of worshipping and praying alongside it. The Moslems, on the other hand, worshiped at the Mosque of Omar, adjoining the Wailing Wall. The spot was sacred to them since they believed that Mohammed sojourned there during a miraculous visit to Jerusalem. It was at this mutually holy place that many of the riots and conflicts of post-war Jerusalem had their origin. The severest of these outbreaks down to 1929 took place late in August of that year, while Sir John Chancellor, who had succeeded Sir Samuel on July 6, 1928, was High Commissioner. This time, the Arabs, egged on by the Grand Sheriff of Mecca, as some believed, instituted a wholesale massacre of Jews throughout the mandate. The British government (the second MacDonald Labor government) rushed several warships and air squadrons to the scenes of disorder, and restored comparative quiet within two or three weeks. For a time, it seemed as though the Arabs from the French mandate of Syria might invade Palestine and aid their kinsmen, but the French took active steps to prevent this. The number of Jewish dead was well over 100. The Arabs, who were mercilessly attacked by the British, lost an approximately equal number.

At the September, 1929, meeting of the League Assembly at Geneva, Premier MacDonald announced his government's intention to continue adhering to the Balfour Declaration and to refuse to countenance any change in the mandatory arrangement. Chancellor remained as High Commissioner, and a committee of investigation was appointed to study and report upon the fundamental causes for the inability of the Arabs and Jews to live side by side in peace. See also ARABIA; CALIPHATE.

PALMER, A (ALEXANDER) MITCHELL (1872-). An American lawyer and United States

Attorney General, born in Moosehead, Pa., and educated at Swarthmore College. After studying law, he was admitted to the bar and practiced for several years in Stroudsburg, Pa. He was a member of Congress from 1909 to 1915 and in the latter year was appointed judge of the United States Court of Claims. This post he resigned after a few months. He was appointed Alien Property Custodian in 1917 and served until 1919, when he was appointed Attorney General in President Wilson's Cabinet. He was prominently mentioned as a presidential candidate in 1920. Following his retirement from political life, he resumed the practice of law.

PALMER, FREDERICK (1873-). An American author and war correspondent, born at Pleasantville, Pa., and educated at Allegheny College. From 1895 to 1897, he was a newspaper correspondent in London. As a war correspondent, he witnessed the Greek War in 1897. During the Spanish-American War, he was in the Philippines and accompanied the expedition for the relief of Peking, China, in 1900. Other campaigns in which he was correspondent were those in Central America and in Macedonia in 1903. He was also a correspondent in the Russo-Japanese War and accompanied the American Battleship Fleet in its round-the-world cruise (1907-08). He investigated conditions in Central America in 1908-09 and witnessed the Turkish revolution in 1909 and the Balkan War of 1912. From 1914 to 1916, he was accredited correspondent of the American press with the British Army and fleet and in 1917 was commissioned major and lieutenant colonel in the United States Army Signal Reserve Corps. His writings include *Going to War in Greece* (1897), *The Ways of the Service* (1901), *Central America and Its Problems* (1910), *My Year of the War* (1915), *My Second Year of the War* (1917), *America in France* (1918), *Our Greatest Battle* (1919), *The Folly of Nations* (1921), *Invisible Wounds* (1925), and *Clark of the Ohio: A Life of George Rogers Clark* (1929).

PALMGREN, SELIM (1878-). A Finnish composer, born at Björneborg. After graduating from the Helsingfors Conservatory, he continued his pianistic studies in Berlin with Ansgore, Berger, and Busoni. He was conductor of a choral society in Helsingfors from 1902 to 1904 and during 1909-12 conducted the orchestral concerts of the Music Society in Abo. He has appeared extensively as a concert pianist and guest-conductor in Finland and Scandinavia. In 1909 he married the famous Finnish soprano, Maikki Pakarinen. In 1921-22 both artists made a very successful tour of the United States. Palmgren's compositions are original and beautiful music and yet conform to established standards. He wrote two operas, *Daniel Hjort* (Helsingfors, 1910) and *Peter Schlemihl* (not produced); a symphonic poem, *Floden*; incidental music to *Tukkimo*; three concertos for piano and orchestra, and songs and male choruses. Special mention should be made of his compositions for piano solo, which show his genius at its best and deserve to rank with similar works of Grieg.

PAN-AFRICAN MOVEMENT. See AFRICA.

PANAMA, pän'a-mä'. A Central American republic situated between Colombia and Costa Rica. Area, 32,380 square miles; population, census of 1923, 442,522, a gain of 29 per cent over 1910. The Canal Zone (not included in the

above) had 71,682 inhabitants in 1911 and 28,002 in 1928, of whom 7482 were Americans. Panama, the capital, in 1920 had 59,458 (37,505 in 1911); Colon, 31,203 (17,748 in 1911). In the 446 government public schools, 54,214 children were enrolled in 1927. In 1911 a national college, the Instituto Nacional, was erected.

Industry and Trade. Only a small area is cultivated. The leading crops are bananas, coffee, cacao, caoutchouc. Sugar and tobacco are beginning to attain importance. As a result of the extensive cattle raising, the export of hides is large. In 1927 banana export reached 4,623,000 bunches, valued at \$2,987,000. The coffee crop for the year 1928 was estimated at 1,800,000 pounds, twice as much as in 1926. In 1927 imports were valued at \$14,109,552 and exports, at \$3,795,660. In 1919 imports were valued at \$11,407,000 and exports, at \$3,757,000. In 1925 the United States supplied 67.6 per cent of the imports and took 88 per cent of the exports. Similar figures for Great Britain were 9.4 and 3.9. Bananas annually account for more than half of the exports. Others are coconuts, balata, hides, gum, sugar. Principal imports are cotton, iron, steel, flour. All the international commerce of Panama moves through the ports of Colon, Panama City, and Cristobal and Balboa in the Canal Zone.

Finance. The finances, reorganized by an American fiscal agent, are based on a biennial budget and are under the control of the fiscal agency of the Panama government whose duties are outlined in an executive decree of June 20, 1929. For the period 1913 and 1914, the budget balanced at \$7,682,428; for 1929-31 the budget balanced at \$17,031,907 with every effort being made to increase revenues and introduce economies. The public debt on Oct. 1, 1927, exclusive of bonds of the National Bank guaranteed by the Government, totaled \$13,491,000 (external debt, \$10,333,500).

History. The constitution, as amended Dec. 26, 1918, provided for a President directly elected and ineligible as his own successor, and a directly elected Chamber of Deputies. In each case, the term was for four years. The provincial governors were also to be popularly chosen. Presidents for the period were. 1912-1916, Belisario Porras; 1916-1920, Ramon M. Valdez (died), Cno L. Urriola; 1920-1924, Belisario Porras; 1924-1928, Rodolfo Chiari; and from Oct. 1, 1928, Florencio Harmodio Arosemena.

By the Thompson-Urrutia treaty between the United States and Colombia (finally ratified in 1921), the latter recognized Panama's independence, and the Colombian boundary to the east was finally fixed. A protocol signed at Washington, May 8, 1924, established diplomatic relations between Colombia and Panama. Panama having been an Associated Power in the War, became an original member of the League of Nations. Panama's continued refusal to accept the White decision (1914) in respect to her boundary dispute with Costa Rica led troops of the latter to seize the town of Coto on Feb. 28, 1921. The danger of general hostilities caused the United States to offer its good offices, which both sides accepted on March 9. The United States insisted that the White award be accepted, and Panama, still protesting, was compelled to withdraw her troops from Coto. The question remained unsettled so far as Panama was concerned, though diplomatic relations with Costa Rica, broken off in 1921, were restored

on Oct. 1, 1928, at the initiation of Chile. In 1922 the Hay-Bunau-Varilla Treaty of 1903 with the United States was the subject of discussion in Washington, the purpose being the removal of those causes of friction under which Panama had chafed for two decades. These included property valuations for the Canal Zone, a free port, docking privileges, etc.

In 1924 negotiations were begun for the revision of the Taft agreements of 1904 regarding the Canal Zone. The agreements were abrogated on June 1, 1924, and supplanted by a commercial treaty signed July 28, 1926. Under this treaty, the United States agreed not to set up any business in the Canal Zone which would compete with the commerce of Panama. Further, Panama obligated herself to help the United States defend the Canal in time of war, and promised to consider herself in a state of war whenever the United States might be a belligerent. If necessary, too, the entire Republic of Panama would be turned over to the United States as a war measure. This treaty was rejected by the Panama National Assembly on Jan. 27, 1927, whereupon the United States Senate refused to negotiate any further.

Later in 1927, the president of the Panama Association of Commerce charged at the Pan-American Commercial Conference that the United States was operating stores in the Canal Zone, thus driving native merchants out of business. This charge was repeated by a group of American business men in a letter to President Coolidge on May 13, 1927. The State Department explained that there was nothing wrong about this since the treaty of 1926 had not yet been ratified by Panama. Throughout 1928 Panama continued to refuse ratification on the ground that the treaty was incompatible with the country's obligations as a member of the League of Nations.

PANAMA CANAL. This great engineering work was opened to traffic Aug. 15, 1914, and since that time has proved an ever-increasing factor in the commerce of the world. In the first 15 years of its operation, 54,021 commercial vessels had passed through the canal paying \$223,751,682 in tolls and carrying a total of 249,777,467 long tons of cargo. It is used by ships of practically all nations having merchant shipping and has served to reduce materially the time and cost of transportation from one continent to another. The canal was opened in 1914 notwithstanding the fact that in the latter part of 1913 there had been serious earth slides in Culebra Cut, and on Oct. 13, 1914, navigation was seriously interfered with until the material could be dredged out. These slides have occurred from time to time and cut off traffic from September, 1915, until Mar. 27, 1916; but since that time, with constant dredging and a careful study of local conditions, it has been possible to keep the canal open to traffic.

As the canal found increased use, docks, warehouses, and repair facilities were provided at either end, and the harbors were dredged to give access for the largest vessels using the canal. Fortifications protecting the canal and its works were constructed, and every effort was made to secure its maintenance and operation on an economical and efficient basis. In fact, it was not many years before the canal more than paid all operating costs, and while this did not take into consideration the overhead and the interest on the original outlay, yet it prevented the canal from being a burden to the nation. The tolls for the

first 15 years of the canal came to within \$50,000,000 of paying the commercial cost of the canal, \$275,000,000 representing this item, and \$113,000,000 being charged to national defense. The cost of the Panama Canal up to the close of the fiscal year ending June 30, 1929, including the balance of appropriations still on hand and available for work in progress, was \$388,000,000, from which should be deducted receipts from the sale of construction material and equipment and the value of buildings and plant turned over to the United States Army and the Alaska Railways. Additional expense was of course involved for government sanitation, payment to the Panama government, etc.; but the sum mentioned covered the actual current cost of the project. See UNITED STATES.

The growing use of the Panama Canal is indicated by the accompanying table and particularly by the statement that during the calendar year 1928, 6334 commercial vessels passed through the canal, a greater number than in any previous year. These vessels had an aggregate net tonnage, Panama Canal measurement, of 28,943,437, carried 29,401,581 tons of cargo, and paid \$26,375,962 in tolls. A total of 3317 commercial vessels made the transit of the Canal from the Atlantic to the Pacific, as compared with 3017 from the Pacific to the Atlantic.

Calendar year	No of ships	Panama Canal net tonnage	Tolls	Tons of cargo
1914 *	350	1,284,293	\$1,508,737.56	1,758,625
1915 *	1,154	3,902,512	4,297,467.11	4,893,422
1916 *	1,217	3,817,704	3,671,162.68	4,774,822
1917	1,960	6,217,054	6,107,696.68	7,443,610
1918	2,070	6,409,886	6,317,455.39	7,284,159
1919	2,130	6,932,984	6,973,095.30	7,463,151
1920	2,814	10,378,265	10,295,362.21	11,236,119
1921	2,783	11,435,811	11,261,098.80	10,707,005
1922	2,997	12,992,578	12,578,407.77	13,710,556
1923	5,037	24,737,437	22,966,838.18	25,160,545
1924	4,893	24,411,760	22,809,416.34	25,892,134
1925	4,774	22,958,158	21,380,759.70	23,701,277
1926	5,420	25,836,241	23,901,540.04	27,586,051
1927	6,085	28,610,984	26,231,022.94	29,102,538
1928	6,334	28,943,437	26,375,962.41	29,401,581
Total	50,018	218,869,099	206,671,023.06	230,115,595

* Canal opened to traffic Aug. 15, 1914.

• Canal closed about three months by slides.

An important development was the increasing use of the Panama Canal for the transportation of petroleum by tank vessels (see PETROLEUM), for the most part loaded on the coast of California. During the calendar year 1928, 981 of the tank ships with a tonnage of 5,306,030 net tons passed through the Panama Canal, paying \$4,639,012.34 tolls, and carrying 4,954,422 tons of cargo. This was 15.5 per cent of the total number of transits during the year, 18.3 per cent of the total Panama net tonnage, 17.6 per cent of the tolls collected, and 16.9 per cent of the cargo carried through the canal. The traffic in 1928 showed a decline from 1927 of 2,129,058 tons of cargo. In the fiscal year 1924, the tanker tonnage passing through the Panama Canal reached the record figure of 1704 transits and 10,212,047 net tons or 39.1 per cent of the total net tonnage. In this year, tankers paid \$9,071,835.65 in tolls or 37.3 per cent of the total.

In 1929 the Secretary of War approved the erection of a \$12,000,000 dam at Alhajuela, Canal Zone, to provide additional storage of water and form a reservoir of 22 square miles which would afford a storage of 22,000,000,000 cubic feet of water. This new project would prevent the water

shortage which threatens canal traffic during about four months of the year and also a check to the waters of the Chagres River in the rainy season. These floods always have proved a menace to navigation. It was estimated that five years would be required to complete the work.

There has been some agitation for the construction of a canal on the Nicaraguan route on the ground that the traffic through the Panama Canal is increasing so rapidly and great canal constructions take such a long time, that the capacity of the Panama Canal may be reached before other facilities are available. Thus, it is said, a proper provision for future needs demands the construction in Nicaragua, and in 1929 preliminary surveys were begun by U. S. Army engineers. As a matter of fact, those in the best position to know point out that the present traffic at Panama is less than 40 per cent of capacity and shows a steady but small growth. Furthermore, sites are available for increasing the water supply of the canal through reservoir construction and the present double flights of locks can be increased to three, thus greatly increasing the capacity in Panama, should the need for such increase become evident.

PANAMA CANAL TOLLS ACT. See UNITED STATES, *History*.

PAN AMERICAN CONFERENCES. These conferences during the years 1914-29, held at the Pan American Union in Washington, D. C., and elsewhere in the Western Hemisphere, rank among the most important of the international gatherings which distinguished this period, both for the number of sovereign states represented and the importance of the questions discussed. The Fourth Pan-American Conference, held in Buenos Aires, July 1 to Aug. 30, 1910, closed its sessions without deciding on the seat of the Conference to be held in 1914, and the Pan American Union in 1913 decided upon Santiago, Chile, as the meeting place of the Fifth Pan American Conference, but due to the outbreak of the War, the Conference was postponed indefinitely, and it was not until Mar. 26, 1923, that it finally convened in Santiago, lasting until May 11. In the interval, however, there were numerous manifestations of Pan Americanism as evidenced by the sessions of the Second Pan American Scientific Congress in Washington, D. C., during the three weeks following Dec. 25, 1915, and the International High Commission which met in 1916; two Financial Conferences were held in 1915 and 1920 to deal primarily with questions of public finance and with the monetary and banking situation in Pan America, with the result that a financial high commission, presided over by the Minister of Finance, was created in each country. Two Pan American Child Welfare Congresses were held in Montevideo in December, 1918, and in May, 1919, at the second of which provisions were made for the establishment of an international Bureau of Child Welfare. The Second Pan American Commercial Conference was in session in Washington during June, 1919.

At the Fifth Pan American Conference which opened in Santiago in 1923, all American countries were represented except Canada, which lacked "sovereignty," Mexico, which at that time was not "recognized" by the United States, and Peru and Bolivia, which refused to attend because of their differences with Chile. Of the 18 subjects on the agenda, by far the most vital question was the disarmament problem, which concerned chiefly Argentina, Brazil, and Chile,

since the United States was covered by the Washington Arms Pact, and the other Latin-American countries had only insignificant armament. No satisfactory agreement was reached, however, due to differences between Argentina and Brazil, and the Conference ended in ill feeling between the A B C states, although important results were effected in the case of other subjects than armament. Under the heading "political co-operation," the most important topic under discussion was the plan for the formation of an American League of Nations for which there seemed to be strong sentiment among the Latin-American delegates. Two methods were projected to accomplish this, namely, the creation of a new association of the American states and the enlargement of the Pan American Union. A concession gained by the Latin-Americans related to the composition of the governing board of the Pan American Union which hitherto had been composed of diplomatic representatives of the American states in Washington and of the United States Secretary of State as permanent president. This representation was considered disadvantageous to the Latin-Americans since thereby membership was restricted to countries enjoying American approval and since the representatives, due to their political status in Washington, were prevented from commenting on important problems with the necessary freedom. Hence, at Santiago, an agreement was effected whereby the composition of the governing board retained the existing representation with the additional provisions that any country not having accredited representatives in Washington or whose representative was temporarily absent, should be free to appoint a special representative on the board, and that the presidency was made elective. Uruguay's proposal to bind the American nations closer together by the formation of a compact American League of Nations was shelved until the next Pan American Conference. The subject of the Monroe Doctrine was brought up in connection with the discussion of the American League of Nations, and despite the attempts of the United States delegation to ignore the topic, the Latin-American delegations forced the statement from the former that the Monroe Doctrine was a unilateral doctrine for which the United States had been and must continue to be solely responsible. A forward step was the revival of the commission of jurists to codify American international law, and this commission which met in Rio de Janeiro from Apr. 17 to May 21, 1927, as the Pan American Conference of Jurists, is generally regarded as from some points of view the most significant of Pan American, or rather international, gatherings ever held. The results of this meeting were later submitted to the Sixth International Conference of American States, which met in Havana in January, 1928. Three additional Pan American Conferences were held in 1927, in the Pan American Union, Washington, D. C., the work of the Inter-American Commercial Aviation Commission, and that of the Third Pan American Commercial Conference, being particularly deserving of mention because of their achievements in a pioneer undertaking.

Because of the growing intensity of feeling over some of the policies of the United States, and the desirability of promoting friendly political and commercial relations in Latin-America, the Sixth International Conference of American States, at Havana, Cuba, from Jan. 16 to

Feb. 20, 1928, was an event of prime interest. The American delegates included Charles E. Hughes, chairman; Noble B. Judah, Ambassador to Cuba; Dwight W. Morrow, Ambassador to Mexico; Dr. R. L. Wilbur, President of Leland Stanford University; former Senator Oscar L. Underwood; Henry P. Fletcher, Ambassador to Italy; and Dr. L. S. Rowe, Director of the Pan American Union; while the outstanding delegate from Argentina was Dr. Honorio Pueyrredon, her Ambassador to Washington; from Brazil came Dr. Raul Fernandez, an international jurist; and the Cuban delegation was headed by Dr. Bustamante, president of the Conference. President Coolidge, accompanied by Secretary of State Kellogg and Secretary of the Navy Wilbur, went to the Conference on the battleship *Texas*, and delivered the opening address on January 16, in which he stressed the desire of the United States for friendship with Latin America and the equal rights of the 21 states present in matters of deliberation. The business before the conference was of six kinds: Organization problems of the union; questions of an inter-American judicial nature; problems of communication; intellectual co-operation; economic problems; and social problems. Mr. Hughes did much to conciliate the various delegations and bring about accord with Latin America in his address, in which he disclaimed any selfish designs in the intervention of his government in the Western republics, and pointed out the policy which his government had pursued in withdrawing from Santo Domingo upon the establishment of stable conditions and its desire to pursue the same course as soon as possible in other Pan American countries.

The Conference accomplished most important pieces of practical work in unanimously adopting a treaty for the regulation of commercial aviation, and in the unanimous adoption by the plenary session of the codification of private international law prepared by Dr. Bustamante and recommended to the Conference by the International Commission of Jurists after the deliberations of that body in 1927. An important consideration to keep in mind in connection with the Pan American Congress is that it "is a consulting body which is not authorized by any nation to take action that will bind that nation before the legislation, or ratification, of the votes of the Congress by the various participating states, each acting for itself." See PAN AMERICAN UNION.

PAN AMERICAN UNION. An official organization founded in 1890 as the International Bureau of American Republics and composed in 1929 of 21 Republics of the Western Hemisphere. It was founded and is maintained for the purpose of exchanging mutually useful information and fostering commerce, intercourse, friendship, and peace, and is supported by the joint contributions of the republics. It is controlled by a governing board comprising the diplomatic representatives in Washington of all the republics of Latin America which subscribe to the union and it has as its honorary president the Secretary of State of the United States and is administered by a director general and an assistant director, elected by the board. It is strictly international in its scope, purpose, and control, and each nation has equal authority in its administration. Its activities include the following: Publication in English, Spanish, and Portuguese of an illustrated monthly bulletin which records the

progress of all the republics; publication of various kinds of descriptive material relating to each country; and the distribution of information helpful in the promotion of Pan American commerce and interests. Another important function of the union is the work of the staff in organizing and arranging the preliminary details and programmes of the numerous Pan American Conferences which it sponsors. The director general in 1929 was Dr. L. S. Rowe, and the assistant director, E. Gil Borges. The headquarters were in the Pan American Building at Washington, D. C. See PAN AMERICAN CONFERENCES.

PANGALOS, THEODOR (1878-). A Greek soldier and dictator, born near Athens. He distinguished himself in the Balkan Wars (1912-13) and in 1919 was made chief of the general staff. After serving as commander-in-chief of the army in Thrace in 1922, he became Minister of War in the Gonatas Cabinet formed toward the end of that year. In the Papana-stassiou cabinet, he was Minister of Justice and later Minister of War (1924). He overthrew the Michalakopoulos régime in 1925 and was proclaimed Dictator and, in 1926, President of the Republic. Overthrown by a conspiracy in August, 1926, he was imprisoned until July, 1928.

PAN-GERMANISM. The term Pan-Germanism in a loose sense is popularly employed in many countries to stigmatize what was regarded as the German policy of imperialism and aggression before and during the World War. This popular application of the term to German political and economic imperialism, or Germany's policy as a world power, was strictly an outgrowth of war-psychology, stimulated by effective propaganda, and was valid only to the very limited degree to which German world policy was affected by the aims and the doctrines of the Pan-German movement. It was only this

latter movement, an expression of extreme German nationalism, which with justice could be called Pan-German. This movement, which had its inception in the eighties and nineties of the last century and the nucleus of which was the Pan-German League, a numerically weak but very aggressive and vocal group, aimed at the creation of a Greater Germany—to be composed of the German Empire, Austria-Hungary, Denmark, Holland, Belgium, and Switzerland—and at the absolute hegemony of this superstate on the European continent. At the same time, the Pan-Germans strove for world expansion, naval supremacy, and an extensive colonial empire. See GERMANY, HISTORY; AUSTRIA; WAR IN EUROPE.

PAN-ISLAMISM. See CALIPHATE; ARABIA; TURKEY

PAN-SERBIANISM. See WORLD WAR

PAN-TURANIANISM. The term Pan-Turanianism is usually applied to the rather loose and vague movement which aims at the awakening of a sense of racial unity among all the various peoples of supposedly Turanian stock, and, through this means, the establishment of political cohesion among these peoples. Within this wider movement, Pan-Turanianism is also used to describe in a more definite sense Turkish aspirations toward the creation of a large Turanian state to be constituted of certain closely related Turanian peoples and to operate under the hegemony of the Osmanlı Turks in opposition to other races alien to the Turanian stock and particularly to the expansion of the Western Powers in Asia. See TURKEY, AFGHANISTAN, TURKESTAN, RUSSIA, CALIPHATE; ARABIA.

PAPER AND WOOD PULP. The growth in the paper and wood-pulp industries in the twentieth century has been extraordinary, and the increased production of printed matter of various kinds is remarkable in most of the civilized countries. The United States ranks first among

TABLE I—UNITED STATES PAPER AND PRINTING INDUSTRIES

UNITED STATES CENSUS OF MANUFACTURES

NOTE.—Data for establishments reporting products valued at less than \$5000 are included in the figures for 1914 and 1919 but not for subsequent years. For individual printing and related industries, see Tables XI and XV.

* Not called for in schedule for 1921.

the paper-producing countries of the world, and is followed by Great Britain, Canada, and Germany, in the order mentioned, although other countries contribute wood pulp, which is the basis of the industry. In 1927 the estimated world production of wood pulp was 15,075,000 tons, of which 8,720,000 tons were chemical pulp and 6,355,000 tons, mechanical or ground-wood pulp. The 1927 world production of paper was estimated at some 19,458,000 tons, of which the United States contributed over 10,000,000 tons, or more than half. In fact, the paper and printing industries combined ranked seventh as regards total output and fourth as regards value added to materials by manufacture in the general census of United States manufactures taken in 1927. Among the 16 industry groups, when considered from the standpoint of product, they were worth \$4,638,571,773, while the value added to materials by manufacture was \$2,808,000,000, distributed as indicated in Table I, on page 1172, which gives statistics for the years 1914 and 1927 with certain intervening years when censuses of manufactures were taken.

In preparing wood pulp, which is now the base of paper manufacture, four methods are employed, one of which is mechanical and three are chemical. In the first, which uses preferably green coniferous wood, a revolving grindstone is used against which barked and clean wood is held by hydraulic pressure. This mechanical pulp or ground-wood pulp is used only for the cheapest grades of paper and board, but may be mixed with chemicals for news, wall, and other cheap papers and boards. The object of the chemical processes is to dissolve out the nonfibrous components of the wood substance leaving cellulose which forms about 50 per cent of the wood substance and is the ideal paper-making material. The sulphite method is the most important of the chemical methods, as the sulphite fibre is used in the manufacture of newsprint where 20 per cent of the sulphite pulp is added to 80 per cent of ground-wood pulp, while for the

better class of white paper and boards, it is used either pure or in mixture with other papers. The sulphite or kraft process is a modification of the older soda process and substitutes sodium sulphate or salt cake, for sodium carbonate or soda ash, which is more expensive. This process was first used in America in Canada in 1907. The soda process is the oldest chemical process and depends upon the action of caustic soda upon the nonfibrous components.

The production of pulp in 1928 in the United States, amounted to 4,510,800 tons, as compared with 4,313,000 tons in 1927, 4,395,000 in 1926, 3,962,000 in 1925, 3,789,000 in 1923, 2,876,000 in 1921, and 2,893,000 in 1914. There are four major grades of pulp, and the proportionate production in the United States from 1914 to 1928 is indicated in Table II.

The United States does not produce all the wood pulp used in its paper industry, and considerable amounts of sulphite chemical wood pulp, both bleached and unbleached, and sulphate pulp, principally unbleached, are imported from Canada, Sweden, Norway, Finland, and Germany. The amount of sulphite imported in 1928 was 948,431 tons, valued at \$55,955,555. This material entered the United States free of duty, and so did the sulphate wood pulp, of which in unbleached form 381,256 tons, imported in 1928, were valued at \$21,170,948. The principal quantity came from Sweden, which supplied 193,145 tons, as compared with 139,945 tons for Canada. Of the sulphite in 1928, Canada furnished 356,558 tons, followed by Sweden with 333,367 tons, Finland with 94,278 tons, and Norway with 63,668 tons.

The accompanying Table III gives the quantities of pulp exported by the principal pulp-producing countries of the world in 1927. Figures for 1913, the year immediately preceding the War, and for 1926 are shown for comparison. In the calendar year 1928, the exports of wood pulp from Canada were 17,276,019 cwt. (1,934,014,128 pounds).

Poland		32,354,000	19,386,000	19,345,000	41,000
Newfoundland	115,595,000	24,969,000	8,263,000		8,263,000
Total principal countries	...	9,037,972,000	9,264,396,000	6,208,098,000	3,056,298,000

The total exports of the 11 principal pulp-exporting countries of the world in 1927 were 9,284,396,000 lb. or 4,632,198 short tons, of which Canada contributed about 19 per cent. While the exports of Sweden, the leading exporter, increased over those of 1913 by only about two-thirds and were decreasing, Canada's exports during the same period had almost tripled and were increasing, in spite of the increasing proportion of pulp production which was being further manufactured into paper in Canadian mills.

The total output of wood pulp in the United States in 1927, as stated in the Census Table, was 4,313,403 tons, valued at \$207,332,666, the principal items comprised in this total being as follows: Ground wood—steamed, 181,031 tons, valued at \$6,857,710; not steamed, 1,429,378 tons, \$39,101,493. Soda fibre, 487,478 tons, \$32,842,265. Sulphite fibre—bleached, 680,228 tons, \$53,847,246;

TABLE VI—PAPER AND PAPER BOARDS

TABLE V—WOOD PULP PRODUCED, BY STATES
1928 AND 1927
U. S. BUREAU OF CENSUS

(This table gives statistics for all States for which separate figures can be shown without disclosing operations of individual establishments. Certain of the "Other States," however, reported larger amounts of pulpwood consumed and of wood pulp produced than some of the States shown separately.)

	Wood pulp produced (Tons: 2000 lb.)	
	1928	1927
United States	4,510,800	4,313,403
Maine	970,690	942,162
Wisconsin	720,781	690,921
New York	633,182	710,227
Washington	849,107	268,349
Louisiana	226,708	179,878
Pennsylvania	218,598	216,587
New Hampshire	198,587	200,324
Virginia	189,925	170,630
Michigan	196,203	193,539
Oregon and California*	213,407	200,869
Minnesota	194,399	191,220
Massachusetts	32,370	31,822
Vermont	19,831	32,562
Other States*	347,012	284,313

* Combined in order to avoid disclosing quantities reported by individual establishments

* 1928—Arkansas, Delaware, District of Columbia, Maryland, Mississippi, New Jersey, North Carolina, Ohio, South Carolina, Tennessee, Texas, and West Virginia; 1927—Delaware, District of Columbia, Maryland, Mississippi, North Carolina, Ohio, South Carolina, Tennessee, Texas, and West Virginia

unbleached, 881,709, tons, \$45,337,303. Sulphate fibre, 593,955 tons, \$28,133,175. Of the 219 establishments reporting the manufacture of wood pulp in 1927, 61 were situated in New York, 33 in Wisconsin, 26 in Maine, 13 in Washington, 12 in Michigan, 12 in Pennsylvania, and the remaining 62 in 18 other States. In the table showing the 1928 pulp production by States, some interesting developments are indicated. The following Eastern States, representing 46 per cent of the total pulp, showed the following percentage change from 1927: Maine, +3 per cent, New York, -10.8 per cent; Pennsylvania, +0.9 per cent; New Hampshire, -10.9 per cent, Massachusetts, +1.7 per cent; and Vermont, -39.1 per cent. The total production of these States in 1928 was 2,073,258, as against 2,103,684 in 1927, a decrease of 60,426 tons, or 3 per cent. The Middle Western States, Wisconsin, Michigan, and Minnesota, representing 25 per cent of the pulp production, showed an increase of 35,000 tons, or 3.3 per cent in 1928, compared with 1927. Wisconsin pulp production increased 4.3 per cent; Michigan, 1.3 per cent; and Minnesota, 1.6 per cent.

In 1921 the United States Census of Manufactures showed that out of 726 mills in the entire country, New York had 155 and was followed by Massachusetts and Wisconsin with 69 and 62 mills, respectively. These three States indicated the geographical distribution of the industry, as the Middle Atlantic States were first in the number of mills, while New England and the Lake States were second and third, respectively. At the beginning of 1923, there were 1691 paper-making machines with an estimated capacity of 9,560,000 tons per annum, and the normal running time of each machine was stated to be 270 days, about 75 per cent of the actual capacity. Of the 709 establishments reporting the manufacture of paper in 1927, 136 were situated in New York, 80 in Massachusetts, 55 in Pennsylvania, 53 in Ohio, 51 in Wisconsin, 42 in Michigan, 37 in New Jersey, 32 in Connecticut, 30 in Illinois, 26

in Indiana, 25 in Maine, 24 in New Hampshire, 14 in Vermont, 12 in Washington, 11 in California, 10 in Maryland, and the remaining 71 in 19 other States.

It will appear from the accompanying table (VII) that the production of paper increased in the United States up to 1920, when the peak was attained with a total output of 7,334,614 short tons. There was a considerable falling off in 1921 due to the carrying over into that year of surplus stock from 1920, and in the years 1922 and 1923, the quantities produced were less, although in 1923 there was an increase in value. The table indicates the distribution of the production for 1914 and subsequent years and also shows the development and production which occurred in the various lines.

The total production of paper and paper board in 1927, as reported by the Census of Manufactures, amounted to 10,002,070 tons (of 2000 pounds), valued at \$872,206,847. This total was made up as follows: Standard newsprint, in rolls and sheets, 1,519,737 tons, valued at \$99,068,924; hanging paper, 109,850 tons, \$8,748,152; poster, novel, news-tablet, lining, catalogue, etc., 183,338 tons, \$15,573,062; book paper, 1,328,782 tons, \$160,868,747; cover paper, 26,333 tons, 5,937,919; writing paper (fine), 508,808 tons, \$105,148,140; wrapping paper, 1,525,305 tons, \$162,579,549; paper boards (container boards, folding box-boards, building boards, etc.), 3,773,608, tons, \$211,203,855; tissue paper, 316,070 tons, \$46,616,-

919; absorbent paper, 63,766 tons, \$13,331,497; building paper, 625,589 tons, \$40,062,024; other paper, 20,864 tons, \$3,008,059.

The 1928 data on paper production which the Bureau of Census collected made the most recent data on the paper industry available unusually early, and the figures are summarized in the accompanying table (VIII).

In 1928 paper production totaled 10,403,338 tons and pulp production totaled 4,510,800 tons. The paper production represents a 4 per cent increase over 1927 and the pulp, a 4.5 per cent increase. There were several substantial gains in the 1928 production, as against that of 1927, in several of the individual grades such as cardboard, with a 108 per cent increase; binders' board, a 52 per cent increase; kraft wrapping paper, a 37 per cent increase; tissue paper, a 10 per cent increase; and absorbent paper, a 17 per cent increase. The following grades showed substantial percentage decreases in production in 1928, as compared with 1927: Newsprint, 6.7 per cent; hanging, 14.5 per cent; catalogue, 24.4 per cent; leather board, 21.9 per cent; and building papers, 10.1 per cent.

The United States also imports considerable paper, principally newsprint, which enters from Canada free of duty. In 1923 newsprint imported amounted to 2,617,685,620 pounds, valued at \$98,021,045, an amount that by 1928 had increased to 4,313,732,865 pounds, valued at \$139,-410,918. Out of total imports of paper of \$156,-

TABLE VII—U. S. PRODUCTION OF PAPER AND WOOD PULP—CENSUS RETURNS

Total				6,420,000	

* Production of newsprint paper in Canada in 1928 is provisionally given as 2,382,011 tons.

384,548 in 1928, the foreign paper entering the United States did not compete seriously with the domestic product as American mills could not supply the great demand for newsprint. In regard to exports, however, American manufacturers do not compete actively on the basis of price but rather on that of quality. The total exports of paper except printed matter in the year 1923 aggregated \$25,677,685 in value, of which newsprint accounted for \$1,636,937; book paper, \$3,001,149. In 1928 exports were valued at \$30,932,651. Book paper, wrapping paper, paper board and straw board, writing paper, sheathing and building paper, and photographic paper were among the other leading exports. The production of newsprint in the United States and Canada is indicated in the accompanying table, which shows the steady character of the industry in the United States, as well as the marked increase in Canada. In the period under review, there was an increase in prices which reached a maximum of about \$0.0608 in January, 1921, from which it declined to \$0.0325 in January, 1925, a price that has prevailed since that time. The increased demand for newsprint was due largely to the great extension of advertising, especially in the daily and Sunday papers, and it was estimated that \$700,000,000 was expended for newspaper advertising alone in 1927.

Canadian Pulp and Paper Industry. The pulpwood and paper industry in Canada since 1914 has developed extraordinarily due to existence of abundant water powers adjacent to extensive forest resources of pulpwood species. In 1928 there was a capital invested in the industry of \$685,687,459, an increase of 18.3 per cent in a year. The industry engaged the services of 33,614 persons at a total remuneration of \$47,322,048, both of these figures showing substantial increases and representing greater amounts than for any other industrial group.

The pulp and paper industry is the most important in the Dominion, heading the list for 1928 for gross and net values of manufactured products, as well as for distribution of wages and salaries. In total capital invested, the industry was second only to electric power and light plants, and in total number of employees second only to sawmills. There were 110 establishments in operation in 1928, as compared to 114 in 1927, and 33 of them made pulp only.

The gross value of pulp and paper produced in Canada during 1928 reached the figure of \$233,535,326, representing an increase of \$14,000,000 over the preceding year and setting a new high mark. In 1924 the pulp and paper figure on the same basis of comparison was \$179,000,000 and there has been an annual increase since 1922. These figures represent the sum of the values of pulp for sale in Canada and for export, and of paper manufactured in Canada. They do not include pulpwood nor the pulp made in combined pulp and paper mills for their own use.

In 1913 Canada produced 2,144,004 cords of pulpwood valued at \$14,313,939, or an average value of \$6.67 per cord. Of this amount, 1,109,034 cords, or 51.7 per cent of the total production, were used in Canadian pulp mills; while the exports of pulpwood amounted to 1,035,030 cords, or 48.3 per cent of the total production. By 1927 the production of pulpwood had increased to 5,929,456 cords, valued at \$70,284,895, or \$11.85 per cord. Of the production, 4,387,687 cords, or 74 per cent of the total production, were used in Canadian pulp mills, and 1,541,769 cords, or 26 per cent of the total production, was exported in the form of raw pulpwood. In 1928 the apparent total production of pulpwood was 6,323,610 cords, of which three-quarters were manufactured into pulp in Canadian mills, while the remainder was exported to the United States.

Exports of pulpwood have shown but little increase, as most of the Canadian pulpwood is used in Canadian pulp mills of which at the end of 1927 there were in operation 42 pulp mills, 42 combined pulp and paper mills, and 30 mills making paper only. In some cases, the more important pulp companies operate sawmills to utilize the large timber to the best advantage, while many lumber manufacturers divert a proportion of their spruce and balsam logs to pulp mills. Pulpwood cut on Crown lands must in every province be manufactured into pulp in Canadian pulp mills; while the pulpwood exported to the United States is cut from private lands.

The production of pulp in 1913 was 854,624 tons, of which 600,216 tons was mechanical or ground pulp, and 254,408 tons was chemical fibre. By 1927 the total pulp production in Canada had increased to 3,278,478 tons, valued at \$114,442,550, of which 1,922,124 tons were mechanical pulp, valued at \$44,174,811, and 1,278,572 tons were chemical fibre, valued at \$69,169,002. The 1927 production was the output of 42 mills manufacturing pulp only and 42 combined pulp and paper mills. Of the 1927 production, 2,262,542 tons, valued at \$63,558,345, were made in the combined pulp and paper mills for their own use in manufacturing. In 1928 the 79 mills manufacturing pulp produced 3,610,724 tons, valued at \$121,458,078, as compared to 3,278,978 tons in 1927, valued at \$114,442,541, representing an increase of 10.1 per cent in quantity and 6.1 per cent in value.

The total paper production in Canada had increased in the period since 1917 from 853,689 tons, valued at \$58,750,341, of which 689,847 tons were newsprint, to 2,468,691 tons, valued at \$168,445,548 in 1927, of which newsprint made up over 84 per cent of the total paper production, 6 per cent of paper boards, 4 per cent of wrapping paper, 3 per cent of book and writing papers, and about 2 per cent of other miscellaneous papers. Quebec produced over half the total amount and Ontario about one-third, with the remainder coming from British Columbia, New

Brunswick, and Manitoba. The distribution of paper by quantities and values in 1927 was as follows: Newsprint, 2,082,830 tons, \$132,286,729; book and writing papers, 75,072 tons, \$12,916,469; wrapping paper, 102,707 tons, \$9,607,828; boards, 161,497 tons, \$8,985,588; other paper products, 46,585 tons, \$4,433,926. In 1928 the mills making paper produced 2,849,687 tons of paper, as compared to 2,468,691 in 1927, showing an increase in value from \$108,445,548 to \$184,462,356.

In 1928 newsprint made up 84.7 per cent of the total paper manufactured. It amounted to 2,414,393 tons, valued at \$144,146,632, as compared to 2,082,830 tons, valued at \$132,286,729, in the preceding year, an increase of 15.9 per cent in tonnage and 9 per cent in total value.

See FORESTRY.

PAPINI, pà-pè-nè, GIOVANNI (1881-). An Italian writer (see Vol. XVIII). He was the editor of *Lacerba* from 1913 to 1915 and *La Vraie Italie* in 1919. Converted to Catholicism in 1920, in the following year, he published a *Life of Christ* which was translated into several languages. His autobiography, *The Failure*, was translated in 1924. Other works include *Cento pagine di poesia* (1915); *Stroncature* (1916); *Testimonanze* (1919); *Giorni di festa* (1920); with P. Pancrazi, *Poeti d'oggi, 1900-1920*, an anthology with biographical and bibliographical notes (1920); *Four and Twenty Minds* (trans. 1922); *The Memoirs of God* (1926); and *Panc e vino*, poetry (1926). Consult *Giovanni Papini*, by Giuseppe Prezzolini (1924), and *Italian Silhouettes*, by Ruth Shepard Phelps (1924).

PAPUA. See NEW GUINEA

PAPYRI. See PHILOLOGY, CLASSICAL.

PAQUET, ALFONS (1881-). A German writer and traveler, born at Wiesbaden and educated there and at the School of Commerce in London, as well as the universities of Heidelberg, Jena, and Munich. He traveled over the greater part of the world. His many works include some fiction, *Prophezeiungen* (1922), *Lusika's Stimme*, and *Ausblick am Meer* (1925); books of travel, *In Palästina* (1915), *Nach Osten* (1915), *Im Kommunistischen Russland* (1919), *Delphische Wanderung* (1922), and *Der Rhein, eine Reise* (1923); the plays, *Fahnen* (1922), *Markolph* (1924), *Sturmful* (1926), and *William Penn* (1927); the essays, *Die neuen Ringe* (1924) and *Städte, Landschaften und ewige Bewegung* (1927); and a volume of verse, *Drei Balladen* (1923). He has edited works by Hu-Kung-Ming and Kirijewski and *John Woolman's Journal*.

PARAGUAY. A republic of South America with an estimated area of 196,000 square miles. The population was estimated at 828,969 in 1927. The capital, Asuncion, had a population of 142,519 at the end of 1928, an increase of nearly 50,000 since 1920. Other large towns are Villarica, 26,000; Concepcion, 11,000; Encarnacion, 7500. Immigration increases little, in 1920 only 330 immigrants receiving state aid, and in 1926, only 317. In August, 1921, in the 27 National Colonies, there was a population of 13,808 of whom 7755 were males. Education is still backward and in 1927 the total school registration was only 100,023 pupils.

Industry and Trade. Agriculture and grazing are the leading activities, though more than half the total acreage is unexploited. The following products figured in Paraguay's foreign trade in 1927: extract of quebracho (used in

tanning), 103,562,000 pounds; mate (Paraguayan tea), 16,291,000 pounds; oranges, 139,837,000; tobacco, 10,267,000 pounds. According to the live-stock census of 1926, there were 3,270,000 cattle, 209,901 horses, 195,192 sheep, and 45,483 hogs. In the same year, there were three meat-packing plants which slaughtered 115,767 cattle. In 1927, 392,000 hides were exported and 2,786,000 pounds of jerked beef. Sugar and cotton are receiving greater attention. The sugar production in 1920 was 5230 tons; in 1921, 2579 tons; in 1925, 2250 tons. In 1922, 844,219 kilos of ginned and unginned cotton were exported. The 1927 production of cotton was 5,640,000 pounds. The country enjoyed great prosperity during the War because of the world demand for meats. The fluctuations are reflected in the following figures (gold peso = \$0.965): imports for 1914, 5,149,000 gold pesos; for 1919, 15,835,970; for 1921, 8,358,922; for 1927, 11,978,000; exports for 1914, 4,584,000 gold pesos; for 1919, 14,816,117; for 1921, 9,316,721; 1927, 14,282,000. The following were the proportions in value by countries of origin of Paraguay's imports: For 1913, Great Britain, 29 per cent; Germany, 28 per cent; Argentina, 13 per cent; United States, 6 per cent. For 1927, Argentina, 33.5 per cent; United States, 18.6 per cent; Great Britain, 10.9 per cent; and Germany, 9.6 per cent. Many of the imports from Argentina are merely reshipped. The greater bulk of the exports go to Argentina for reshipment abroad.

Finance. The 1913 estimated revenue was 3,248,000 gold pesos and 21,688,000 paper pesos (paper peso is worth 7 cents); estimated expenditure was 1,863,000 gold pesos and 48,307,000 paper pesos. The 1926-27 estimated expenditure was 5,146,461 gold pesos; estimated revenue was 5,186,244 gold pesos. The total national debt on July 31, 1928, was 6,503,898 gold pesos and 27,267,179 paper pesos. In 1928-29 revenues were estimated at 5,445,685 gold pesos and expenditures at 5,412,255. In 1914 the figures were: external debt, \$3,757,573; internal debt, \$5,091,218.

History. Eduardo Schaerer (1911-15), the first President of Paraguay in 40 years to complete his term, was succeeded by Manuel Franco (1916-19), under whose peaceful administration the country greatly developed its packing industry. By 1919 packing products constituted Paraguay's leading export. Manuel Gondra, elected for the term 1920-24, was forced to resign in 1921 by a revolution, and was succeeded by Dr. Eusebio Ayala. Dr. Eligio Ayala, who became provisional President in 1923, was regularly elected in 1924 and served until 1928. His administration was without unusual incident, despite the recurrent irritations of the 100-year-old Chaco Boreal boundary dispute with Bolivia. He was succeeded on Aug. 15, 1928, by Dr. José P. Guggiari, the Liberal candidate, who had campaigned on a platform calling for the peaceful settlement of the boundary dispute. On Dec. 5, 1928, a clash between Paraguayan and Bolivian frontier patrols at Vanguardia precipitated a serious crisis. Bolivia severed diplomatic relations with Paraguay on December 8 and war fever aroused in both countries threatened to embroil them and other leading South American countries.

The crisis was averted through the intervention of a Pan-American conference in session at Washington at the time. Paraguay and Bolivia finally agreed to accept the protocol of concilia-

tion submitted by the conference, which then appointed a commission composed of two delegates each from Bolivia and Paraguay and one each from the United States, Mexico, Colombia, Uruguay, and Cuba, to investigate and conciliate the dispute. On Sept. 5, 1929, neutral members of the commission reported that under a formula agreed upon as a basis for arbitration of the differences between the two countries, Paraguay would receive title to that portion of the Chaco Boreal lying south of the Rio Verde, originally awarded to her by President Hayes, and Bolivia would obtain an outlet to the Atlantic Ocean by way of the Paraguay River. On Sept. 12, 1929, the commission adopted a resolution which attributed the crisis to "the employment of coercive measures on the part of Paraguay in the Vanguardia incident." It was also announced that both governments had agreed to a renewal of diplomatic relations and to the reestablishment of the status of the frontier as it existed prior to Dec. 5, 1928, under the supervision of two Uruguayan officers. In October, 1929, the United States and Uruguay suggested that Bolivia and Paraguay agree to the creation of a new commission of neutrals to assist in settling permanently the Chaco boundary question. In 1929 a boundary treaty with Brazil was promulgated.

The period 1914-29 was marked by the appointment of an American financial adviser to the Government in 1921, following the announcement that Paraguay could not meet her external obligations, and by a severe hurricane which partially destroyed the city of Encarnacion on Sept. 20, 1926, with the loss of 200 inhabitants and \$1,000,000 property damage.

In 1926 it was estimated that there was invested in the principal industries of the Republic a total of about 74,219,000 gold pesos and about 103,794,000 paper pesos nominal, of which 39,864,145 gold pesos and 60,988,400 paper pesos were paid in. Great Britain's investments in the country at that time were placed at about 20,000,000 gold pesos, those of French interests, at 5,000,000 gold pesos, and those of Argentine capital, at more than 30,000,000 gold pesos. The combined capitalization of American meat-packing and quebracho companies in Paraguay was about \$5,000,000.

PARALYSIS, INFANTILE. See INFANTILE PARALYSIS.

PARASITOLOGY. See VETERINARY MEDICINE.

PARAVANE. A naval device developed by Commander C. D. Burney of the British Navy. Its earlier form, the explosive paravane, was designed mainly for use against submerged submarines and had many resemblances to the old Harvey towing torpedo. It consisted of two cigar-shaped submerged mines, each carrying an explosive charge and a depth mechanism to insure its sustained immersion at the desired depth. The mines were towed by cables, one on each side of the ship, and were deflected outward by fixed vanes on the shell until the towing cables made an angle of 20 to 60 degrees with the ship's course, depending on the speed. The explosion of the charge took place if the hull of a submarine or the shell of a mine were struck or if a firing key on the bridge were pressed. In the latter type, the torpedo-shaped floats, or "otters," as they were called, carried no explosive charge but were fitted with saw-like jaws for cutting mine-anchor cables. The towing rope was attached to the stem of the ship, a

dozen feet or more below water. Any mine which lay close to the course of the ship was caught by one of the towing ropes pressing against the anchor line. The latter slid along the towing rope until it reached the "otter's" jaws, where it was instantly cut. The mine then rose to the surface clear of the ship and could be easily destroyed by gunfire. This type of paravane was eventually fitted to all large warships and merchant steamers during the World War. Paravanes saved many vessels from being sunk by mines and revealed the location of several new and unknown mine fields. They were also used for mine sweeping and in searching for mine fields. Since the War, some improvements have been made in the "otter" machinery, inhaul gear, etc. See MINE, SUBMARINE.

PARIS. The capital of France and, after London, New York, and Berlin, the fourth city in size in the world. The population at the census of 1926 was 2,871,429, a decrease of 35,043, as compared with the census of 1921. The population of the rest of the Department of the Seine was approximately 1,750,000, a gain of 249,361 since the census of 1921, making the population of Greater Paris 4,628,637 in 1926. The expansion of Paris has been facilitated by the demolition of part of its fortifications, consisting of the continuous rampart around the city with its theoretically free zone of 250 meters (273 4 yards) and a ring of forts and redoubts situated about a mile outside the ramparts. This project was originated in 1919, but the second ring of forts, about five miles from the city, was retained. In addition to the 100,000,000 francs which the city paid for the fortifications, the cost of leveling the works has amounted to 158,000,000 francs. On the sites which first became available, several blocks of workmen's dwellings were erected. The removal of the fortifications added 988 acres to the available area of Paris and 1729 habitable acres to the suburbs just beyond the city limits.

With the demolition of the old city walls, the subway system of Paris is being extended to the hitherto isolated suburbs. This has been made possible by the merger of the two companies, the Nord-Sud and the Metropolitan. In all, 15 extensions are planned which will represent 20 miles of new lines at a cost of 245,000,000 francs. A loan for this extension was floated by the City of Paris in December, 1928. At the same time, another loan amounting to 105,000,000 francs was issued to meet the need of housing construction. In 1929 a five-year building programme which included the construction of 80,000 apartments, or 50,000 cheap dwelling houses, and 30,000 apartments of medium rental values was entered upon. The building activity of Paris has also included the completion of the Boulevard Haussmann, one of the finest streets in Paris. For more than 50 years, it had remained uncompleted at its eastern end, leaving a gap of a few hundred yards between the Rue Taitbout and the junction of the Boulevards des Italiens and Montmartre. Its completion in 1927 was a great relief to the traffic congestion of the Place de l'Opéra.

The port of Paris is the largest port of France in amount of tonnage handled. In 1927 its freight traffic amounted to 12,250,000 tons, as compared with 8,200,000 tons at Marseilles, and 6,510,000 tons at Rouen. Determined efforts are being made to develop Paris as a seaport and to increase the navigable depth of the Seine so as

to admit of the passage of larger vessels than have hitherto been able to proceed above Rouen. The Seine is to be deepened to a depth of 4.5 meters (14.8 feet); the Canal de l'Ourcq widened to facilitate traffic with the east and with the Rhine; and the ports of Gennevilliers, Bonneuil, and Pantin created. To facilitate river traffic, the old Pont de la Tournelle, which joined the Ile Saint-Louis to the south bank of the river, has been demolished and a new concrete structure, with a single span of 75 yards, erected in its place. The Department of the Seine also has projected the building of a series of basins on the sites of the old fortifications, construction of reservoirs on the upper reaches of the Seine and Marne to regulate the flow during flood periods, extension and improvement of present methods of handling sewage and waste water, straightening channels, and increasing the height of certain bridges. The Basilica of the Sacred Heart, which was built as a propitiation for the War of 1870, was consecrated on Oct. 16, 1919. The grave of the Unknown Soldier of France is beneath the Arc de Triomphe in the Place de l'Étoile.

PARIS CONFERENCE. See PEACE CONFERENCE AND TREATIES.

PARK, JULIAN (1887-). An American educator, born at Buffalo, N. Y., and educated at Williams College and the universities of Paris, Columbia, and Minnesota. He was assistant director of the Buffalo Fine Arts Academy from 1911 to 1913 and in the latter year was appointed instructor in French at the University of Buffalo where he was successively instructor in history, professor of history, and department head, secretary of the College of Arts and Science, and dean. During 1925-27 he lectured at the Geneva (Switzerland) School of International Studies. He was a member of many historical and learned societies and was the author of *Philatelic Rambles* (1912); *History of the University of Buffalo* (1917); *Subject Peoples under the Teutons* (1918); *Napoleon in Captivity* (1927); and editor of *Cuba in the Seven Years' War* (1920). He was a frequent contributor to *The University of Buffalo Studies*.

PARK, WILLIAM HALLOCK (1863-). An American bacteriologist, pathologist, and sanitarian, born in New York City and educated at the College of the City of New York and Columbia University. In 1897 he was made professor of bacteriology and hygiene in the Bellevue-University Medical College. In 1894 he had been appointed director of the bureau of laboratories of the New York Board of Health. In 1900 appeared his textbook, *Bacteriology in Medicine and Surgery*, while in 1910, in collaboration with Williams, he published *Pathogenic Microorganisms*, which passed through eight editions in 14 years. He edited the reference work, *Public Health and Hygiene* (1920), and was a voluminous contributor, alone or in collaboration, to the periodical press, with special reference to diphtheria and typhoid fever. In 1923 he was president of the American Public Health Association.

PARK COLLEGE. A nonsectarian institution at Parkville, Mo., founded in 1875. The enrollment increased from 412 students in 1914 to 501 in 1928-29; the faculty from 24 to 36 members; and the library from 25,000 to 36,000 volumes. A number of buildings were constructed during the period under review, including: the president's residence, a men's dormi-

tory, a lighting and heating plant, a Carnegie Library, and Wakefield Science Hall, in 1924. The endowment fund was greatly increased, amounting to \$1,660,000 in 1928, in which year the income was as follows. From endowment, \$84,000; tuitions and fees, \$91,000; donations, \$47,500; and other sources, \$9,500, making a total of \$232,000. In 1926 gifts received included: \$13,500 in land; \$100,000 for a new dormitory; and \$25,000 by legacy. It was decided in 1924 to discontinue the work of a preparatory school which was conducted in connection with the college, and an orientation course for freshmen was established; in the spring of 1927, a plan of honors work was adopted by the college for which about 10 per cent of the senior class is recommended annually. President, Frederick W. Hawley, D.D., LL.D.

PARKER, THE RT. HON. SIR GILBERT (1862-). An English novelist (see VOL. XVIII). From 1900 to 1918, he was a Conservative member of Parliament for Gravesend. He was created a baronet in 1915 and made a member of the Privy Council in 1916. During the first two years of the World War, he had general charge of British publicity in the United States and did excellent service in creating favorable sentiment in behalf of the Allies. His later books include: *You Never Know Your Luck* (1915); *The World For Sale* (1916); *Wild Youth* (1919); *No Defense* (1920); *Carnac's Folly* (1922); *The Power and the Glory* (1925); *There is the Man* (1927), and *The Promised Land* (1928). He also wrote *The World in the Crucible* (1915), a book on the World War.

PARKHURST, HELEN. See EDUCATION IN THE UNITED STATES, under *Dalton Laboratory Plan*.

PARKS, NATIONAL. Created in August, 1916, by an Act of Congress. The National Park Service of the United States, which placed the national parks and monuments in the Department of the Interior, was under the general charge of a director. The act provided also that the Secretary might make rules and regulations for the use and management of the reservations and prescribe punishment for the infraction of such rules and regulations. Up to 1916, 16 parks had been created; the latest up to that time were the Hawaiian National Park in the Territory of Hawaii and the Lassen Volcanic National Park in northern California.

Since the establishment of the National Park Service in 1916, the number of national parks has been increased to 21, and in addition there are 33 national monuments under the jurisdiction of the National Park Service. The new parks are: Mount McKinley, Alaska (1917); Grand Cañon, Arizona (1919), formerly a national monument; Acadia, Maine (first reserved, upon donation of lands, as the Sieur de Monts National Monument in 1916; then changed to Lafayette National Park by act of Congress in 1919; later, in 1929, enlarged and the name changed to Acadia National Park); Zion, Utah (1910), formerly known as the Mukuntuweap and later as the Zion National Monument, Bryce Cañon, Utah (1928), formerly the Bryce Cañon National Monument; Grand Teton, Wyoming (1929). The Bryce Cañon National Park was formally dedicated in September, 1928, and the Grand Teton, on July 29, 1929.

During the travel-year ended September 30, 1928, a total of 3,024,844 people visited the national parks and monuments, as against 356,097

in 1916 and 755,325 in 1919. These latter two figures cover travel to the national parks only, as no figures were available concerning the few visitors to the national monuments in these years.

Plans were being developed for a national park in the South, to be known as the Great Smoky Mountains National Park. Authority to establish this and the proposed Shenandoah National Park was granted by Congress in 1926, contingent upon the land within the specified areas being donated to the Government in fee simple. The total funds necessary to acquire the lands for the Great Smoky Mountains Park, amounting to \$10,000,000, have been secured by donations from the Laura Spelman Rockefeller Memorial and from private citizens, and by appropriation of State funds by the Legislatures of Tennessee and North Carolina. In 1929 title to more than half the total specified minimum area of the proposed park had been secured and plans were being made by the two States to turn this area over to the Government for administration and protection, as the enabling act provides that 150,000 acres may be accepted by the Secretary of the Interior for administration and protection, but not for development, as a national park. It was hoped that the entire minimum area of 427,000 acres set by Congress would be acquired within a short time.

PARMOOR, CHARLES ALFRED CRIPPS, FIRST BARON (1852-). An English lawyer, educated at Oxford. He was one of the most prominent laymen of the Church of England, was Vicar General of Canterbury (1902-24) and Attorney General to the Prince of Wales (1895, 1901, 1912). Elected to Parliament in 1895, he was a Conservative in politics but later broke away from his party because of his free-trade ideas. He supported Labor, became a strong believer in the League of Nations, and was appointed by Prime Minister Ramsay MacDonald as Lord President of the Council in the first Labor cabinet of 1924 and in the second formed in June, 1929. He was a strong advocate of disarmament. In 1914 he was made a judicial member of the Privy Council by special appointment, and was created a baronet. He published *Principles of Compensation and Laws of Church and Clergy*.

PARODI, DOMINIQUE (1870-). A French philosophical writer, disciple of Renouvier and Hamelin. He published in 1919 a comprehensive survey of contemporary French philosophy, *La Philosophie contemporaine en France, Essai de Classification des Doctrines*. His other works include *Le Problème moral et la pensée contemporaine* (1910) and *Traditionalisme et démocratie* (1908).

PARSONS, FRANK ALVAH (1868-) An artist and critic born at Chesterfield, Mass., who studied art in Italy, France, England, and Austria. He has published many books on art, including *Principles of Advertising Arrangement*; *Interior Decoration, Its Principles and Practice*; *The Psychology of Dress*; *The Art Appeal in Advertising Display*. He was coauthor of *Advertising, Its Principles and Practice*, and *Art, Its Principles and Practice Applied to Modern Life*. Besides writing books on art, he has delivered lectures in many parts of the United States and written articles and pamphlets on art subjects. He has been president and director of the New York School of Fine and Applied Art, since 1905, and professor of advertising display in New York University, since 1915.

PASHITCH, pā'shich, NIKOLA (1846-1926). A Yugoslav statesman (see VOL. XVIII). He was premier at the time of the Sarajevo assassination and throughout the World War, and attended the Peace Conference in Paris, where largely through his efforts the Kingdom of Yugoslavia was established. In 1923 an attempt was made on his life. With the exception of short periods, he remained Premier from 1921 until his death. He stood strongly for centralization of the government, weakening the Croation Separatist movement by taking its leader, Raditch, into his cabinet. He died the day after he was called by the King to form a new cabinet to handle the dispute with Italy over the Italian-Albanian Treaty. See JUGOSLAVIA.

PASIC, NIKOLA. See PASHITCH, above.

PASSY, pā'sé, PAUL ÉDOUARD (1859-). A French philologist who made a special study of phonetics (see VOL. XVIII). His later publications include: *Phonetic Reader* (1915); *Premier livre de lecture* (1917); *Lectures françaises phonétiques* (1918); and *Conversations françaises en transcription phonétique* (1919).

PASTOR, pās'tór, LUDWIG (1854-). A German historian and professor at the University of Innsbruck (see VOL. XVIII). His later publications included *Conrad von Hatzendorf* (1916); *Generaloberst von Danke* (1916); *Der Staat Rom zu Ende der Renaissance* (1916); *Charakterbilder katholischer Reformatoren* (1924); and *Die Fresken der sizilianischen Kapelle* (1925). He edited *Johannes Janssens Briefe* (1922) and *Janssens Geschichte des deutschen Volkes*.

PATERSON. A manufacturing city of New Jersey. The population increased from 125,800 in 1910 to 135,875 in 1920 and to 144,900 in 1928, according to the estimate of the U. S. Bureau of the Census. The city has a comprehensive zoning ordinance adopted in 1921, providing for four residence, two business, and two industrial, zones. Four modern school buildings were completed in the period from 1914 to 1924, and in the latter year a \$1,250,000 high-school building was erected. The number of manufacturing establishments increased from 702 in 1909 to 1120 in 1927 and the value of their output from \$67,000,000 in 1909 to \$207,469,696 in 1927. Approximately 33,800 workers were employed in these establishments and received \$45,003,000 in wages. Paterson is the leading silk-manufacturing centre of the United States, approximately 75 per cent of the silk goods produced being dyed and finished in the Paterson district. It is also the home of the leading aeronautical motor works of the United States. Bank resources rose from \$43,000,000 in 1914 to \$156,065,731 in 1927. Building construction within recent years includes the Valley View Tuberculosis Sanatorium erected by Passaic County, a modern hotel, and a new theatre and office building. The Erie and the Lackawanna railroads have spent approximately \$10,000,000 in the elimination of grade crossings, new freight-handling facilities, and new stations. The assessed valuation of property in 1927 was \$200,464,000; the net debt was \$17,076,000.

PATRICK, MASON MATHEWS (1863-). An American military engineer and former chief of Air Service. He was born at Lewisburg, W. Va., and was graduated from West Point in 1886, and from the Engineering School of Application in 1889. From second lieutenant of engineers, he was promoted through the grades to

colonel (1916). Besides serving at different periods on Mississippi River and Great Lakes improvement projects, in river and harbor work at Norfolk, Va., and on duty at the office of the Chief of Engineers in Washington, he acted as instructor in engineering and was in command of the engineers' detachment at West Point. He was also chief engineer of the Army of Cuban Pacification (1907-09) and was a member of the board detailed for raising the U.S.S. *Maine* (1910-12). In 1916-17 he was commandant of the Engineer School at Washington Barracks, D. C. In the World War, he was made a brigadier general (1917) of the National Army (major general, 1918) and served as chief engineer of lines of communication and director of construction and forestry with the A. E. F. in France until May, 1918. He then became chief of Air Service. Returning to the United States after the Armistice, he was assigned to engineer duty at New Orleans (1919-20) and as assistant chief of engineers (1920-21). He was appointed chief of the Army Air Service in October, 1921, with the rank of major general, U. S. Army, and reappointed four years later. He was retired in 1927. He received the D. S. M. and various European orders for his war services.

PATROL SHIP. See VESSELS, NAVAL.

PAUL, BRUNO (1874-). A distinguished German architect who studied in Dresden and Munich and was professor and member of the Berlin Academy and director of the State Schools of Free and Applied Arts. He was also a clever draughtsman and illustrator and was for many years a contributor to *Simplicissimus*. He received the Grand Prix in Paris (1900) and in St. Louis (1904).

PAUL TEST. See SMALLPOX.

PAVEMENTS. See ROADS AND PAVEMENTS.

PAVLOV, pav'lóf, IVAN PETROVITCH (1849-). A Russian physiologist (see Vol. XVIII). Having become eminent through his work on the physiology of the digestive glands, which was carried out in part on dogs with artificial stomach pouches and which was interrupted by the Russian Revolution, he distinguished himself in a new field, that of the so-called conditioned reflexes as studied in the dog. His first book on this subject appeared in Russian in 1923 and has since been translated into English, French, German and Spanish. Pavlov's experiments on these reflexes originated many years ago and are said to be the foundation of the behavioristic school of psychology. In his eightieth year, his activity was undiminished and he planned to visit the United States in 1929. In 1928 he delivered the Croonian Lectures before the Royal Society of England. He resigned his professorship of physiology at the Military Medical School, Leningrad, in 1924. The results of twenty-five years of study were published in *Lectures on Conditioned Reflexes*, translated into English in 1929. See PSYCHOLOGY and also BEHAVIORISM.

PAYNE, JOHN BARTON (1855-) An American public official, born at Pruntytown, Va. (now W. Va.), and educated at Orleans, Va. He began to practice law in West Virginia in 1877, moved to Chicago in 1883, and was appointed judge of the Superior Court of Cook County, Ill., holding the office for five years. He was appointed general counsel of the United States Shipping Board Emergency Fleet Corporation in 1917 and director general of railroads in 1918. He held the post of Secretary of

the Interior in President Wilson's cabinet from February, 1920, to Mar. 4, 1921. He was made chairman of the American Red Cross by President Harding on Oct. 1, 1921. In April, 1923, he was one of two commissioners appointed by President Harding to confer with representatives of Mexico with a view to American recognition of Mexico. He was president of the Board of South Park Commissioners, Chicago, 1911-24.

PEACE CONFERENCE AND TREATIES.

A task of world-wide reconstruction and readjustment confronted the statesmen and diplomatists of the victorious Allied and Associated Powers at the end of the World War. To arrange a settlement of the problems of peace, a whole series of conferences was held and the results of their deliberations were registered in numerous agreements, treaties, protocols, and conventions. During the War, the Allied cause in general had represented "a most curious combination of lofty idealism with an undercurrent of selfish ambition." The openly avowed ideals were usually at utter variance with the more sordid ulterior aims. "Practical" men—nationalists, imperialists, and militarists—insisted that the immediate problem was to punish Germany and her allies for their atrocious crimes against civilization, to exact the greatest possible indemnity, to reduce the Central Empires to military impotence and so to cripple German industry and commerce as to make impossible any effective or dangerous competition by her in the future economic development of the world. The German colonies and the Turkish Empire were to be divided among the victors and the litigious estates of the Hapsburgs liquidated to satisfy the nationalistic aspirations of Italy and the smaller Allies. Most of these aims had been embodied in the secret engagements and commitments negotiated by the various European Allies and Japan at intervals during the years 1915, 1916, and 1917, before the United States entered the War. In regard to Turkey, secret discussions continued unabated throughout the conflict and at the time of the Peace Conference in 1919 Lloyd George and Clémenceau were still haggling silently but strenuously over the division of the spoils. These secret treaties constituted a comprehensive programme for dividing the world, a hard and fast basis for the final peace settlement. They "were destined to bear a crop of suspicion, controversy, balked ambition, which twice, at least, nearly wrecked the Peace Conference, poisoned its discussions, and warped and disfigured its final decisions."

Entirely opposed to the plans of settlement represented in the secret treaties were the openly voiced aspirations of numerous liberal and labor groups in the various belligerent countries. Some of the statesmen who professed idealistic motives were sincere in their convictions; others utilized idealism as a cloak for their activities while engaged in forging the chain of secret treaties. Yet their utterances outwardly imparted to the Allied cause during the last few years of the War all the moral elevation of a crusade for human righteousness. In particular, the various addresses of Woodrow Wilson, President of the United States, served to clarify the fundamental issues of the War and to provide a set of legitimate aims and guiding principles for the inauguration of a more enlightened era of international peace and cooperation. From 1917

on, Mr. Wilson enjoyed an unparalleled prestige and influence in the public opinion and counsel of the world. The principles of his war-aims addresses of 1918 were the official basis of the pre-Armistice terms agreed upon with Germany and her associates. These terms were binding on all parties and constituted in a technical sense the legal basis of the peace settlement. With two qualifications, the Allied Powers bound themselves to impose no conditions of peace inconsistent with Mr. Wilson's "Fourteen Points" of January 8, his "Four Principles" of February 11, his "Four Ends" of July 4, and his "Five Particulars" of September 27. Judgment was reserved by the Supreme War Council on the second of the Fourteen Points relating to the "freedom of the seas"; this was declared to be open to various interpretations some of which they were unable to accept. In addition, it was expressly stipulated that the demands for the restoration of territories invaded by Germany should include compensation for all damages done to the civilian populations of the Allied countries by land, by sea, and from the air. The Armistice signed with Austria and Hungary was unconditional as finally agreed upon, yet the preceding diplomatic exchanges between the Austro-Hungarian and American governments had created, if not a legal, at least a strong moral, obligation to arrange peace upon the basis of the President's addresses except in regard to Point Ten, which was modified by Wilson himself to assure complete and unconditional self-determination to the Czechoslovaks and Jugoslavs hitherto incorporated in the Dual Monarchy. With Bulgaria and with Turkey, Mr. Wilson entered into no negotiations at all, but the Fourteen Points touched upon their cases.

The two months which elapsed between the signing of the Armistice with Germany (Nov. 11, 1918) and the first meeting of the major Allied plenipotentiaries in Paris (Jan. 12, 1919) were marked by extremely significant developments throughout the world. The contemporaneous revolutions in Central Europe which resulted in the establishment of democratic republics in Germany, Austria, and Hungary failed to effect any considerable change in the attitude or plans of the Allies. In Italy, a tremendous wave of nationalistic feeling overwhelmed all efforts of liberal and socialist leaders to pledge the support of that country to a peace of conciliation. In France, Premier Clémenceau, unmoved by Socialist attacks, announced his intention of securing the utmost possible security and indemnification for France together with the maintenance of the old system of alliances. His government received an overwhelming vote of confidence as he thus threw down the gage. In Great Britain, Parliament was dissolved in November and a general election held on December 14. Premier Lloyd George, discarding the liberalism of his war-aims speech of Jan. 5, 1918, made the issue of his campaign a hard and bitter peace. His platform included recovery of the entire costs of the War—"shilling for shilling and ton for ton"—and punishment of war criminals. The result was a stupendous triumph for his Coalition which secured a majority of over 260 seats. The Labor Party advocating a Wilsonian peace secured 61 seats and became the official Opposition.

President Wilson could point to no such popular mandate or parliamentary vote of confidence.

Indeed, despite his appeal to the American people for support in the shape of a Democratic Congress, the elections of November 5 had returned small Republican majorities in both the House and the Senate. Republican leaders in office and out were bitterly attacking the President's policies. Ex-President Roosevelt was particularly vehement. He openly asserted that Mr. Wilson had no authority whatsoever to speak for the American people as his leadership had just been emphatically repudiated by them. It was the duty of the Allies to impose their common will upon the nations responsible for the hideous disaster which had almost wrecked mankind. Mr. Roosevelt's manifesto harmonized perfectly with the purposes and plans of Clémenceau and Sonnino.

Notwithstanding the fact that recent electoral reverses had thus seriously discredited his leadership at home, Mr. Wilson, against the advice of Secretary of State Lansing, made the momentous decision to go abroad as head of the American commission to negotiate peace. He was animated by a sincere determination to work for the incorporation of his ideals into the substance of the peace treaty, to see to it that no false or mistaken interpretation was put upon them and no possible effort omitted to realize them. He claimed to be under no illusions as to the difficulty of realizing his programme. Arriving in France on December 13, Wilson found that although the date for the Peace Conference had been set for the 17th, a month more was to elapse before real work began. He spent the interval visiting the various Allied countries, conferring with statesmen and making speeches, being warmly received by liberal and radical elements which gave whole-hearted support to his reiterated proposals for a peace of justice.

THE PARIS PEACE CONFERENCE

The five Principal Allied and Associated Powers which had contributed most to the winning of the War assumed supreme charge of arranging the Peace. It was early decided to exclude the enemy powers from the impending Congress until preliminary terms had been agreed upon among the Allies. Paris—the shell-shocked nerve-centre of Allied resistance to Germany—was selected as the scene of the Preliminary Conference. Here on Jan. 12, 1919, there finally convened a meeting of the Supreme Council, its membership now comprising the chief executives of Great Britain, France, Italy, and the United States, together with their respective foreign ministers. Two Japanese representatives were admitted on the following day and this "Council of Ten," as it came to be known, definitely inaugurated the work of the Peace Conference and continued to dominate the course of events until the middle of March when it was transformed into the "Council of Four" and a subordinate "Council of Five."

Organization. Quickly, the Council of Ten proceeded to the organization of Peace Conference machinery. Thirty-two states which had been at war with Germany or had severed diplomatic relations with her were admitted to membership in the plenary conference, though with varying degrees of representation. Adopting a middle course between the proposals of the extreme militarists who advocated a body made up of delegates from the Great Powers alone which should frame a treaty to be imposed on smaller Allied States and enemy powers alike, and the

proposals of the extreme legalists who championed the theoretical equality of nations with uniform representation for all, the Supreme Council apportioned plenipotentiaries to each on the basis of size, military power and prestige, and service or suffering in the recent War. Of the 70 officially authorized plenipotentiaries, five were assigned to each of the Great Powers—France, Italy, Japan, Great Britain, and the United States; three each to Belgium, Brazil, and Serbia (later officially recognized as Yugoslavia); two each to Australia, Canada, China, Czechoslovakia, Greece, Hedjaz, India, Poland, Portugal, Rumania, and Siam; and one apiece to Bolivia, Cuba, Ecuador, Guatemala, Haiti, Honduras, Liberia, New Zealand, Nicaragua, Panama, Peru, and Uruguay. While thus allocating the formal representation for plenary sessions, the Council of Ten reserved to itself the power of determining the course of procedure, conducting preliminary deliberations, and making the really important decisions. The plenary sessions were to prove almost entirely devoid of any significance save the ceremonial function of ratifying and registering decisions already made. On January 18, at the first plenary session, Premier Clémenceau of France, who presided at meetings of the Supreme Council, was elected as President of the Conference.

In addition to formally authorized participants in the Conference, streams of uninvited and sometimes unwelcome guests from all parts of the world converged upon Paris, in the hope of securing a hearing or at any rate of arousing interest in the aims and ambitions of their respective nationalities. Armenians, Syrians, Georgians, Ruthenians, Estonians, Lithuanians, Letts, Finns, Albanians, Persians, Egyptians, Koreans, Zionists, Schleswigers, Åland Islanders, Irish-Americans, Negroes, and others came to present ex-parte evidence and plead for justice. "Never before had Europe witnessed such a gathering of rulers and rivals, or realists bent on material gains and idealists striving for a happier world." Realists and idealists alike usually met with disappointment. Small nations were to be allowed to present their cases; even neutrals were to be heard in matters specifically affecting their interests; but the real power was to rest with the chief representatives of the five largest states.

To assume, however, that the treaties emanating from Paris were drafted by a small group of men—the "Ten," the "Four," or the "Three"—and that the terms were fixed by them would be highly erroneous. Each delegation at the Conference had a numerous staff of territorial, ethnographic, and historical specialists, economic advisers, and other experts, and these together with the plenipotentiaries supplied the personnel for some 58 technical commissions constituted during the first six months of 1919 to make preliminary investigations and reports on various problems of the settlement. These commissions held over 1600 meetings and their conclusions and recommendations were discussed by the Council of Ten, which held 72 meetings, the later Council of Four, which held 145 sessions, and the subordinate Council of Five, which met 39 times. Most of the articles in the treaty were taken bodily, without change, from the reports of commissions.

Wilson's First Point declaring for "open covenants openly arrived at" was seriously vitiated at Paris. Despite a keen struggle waged by the Americans for a wider measure of

publicity, only the plenary sessions of the Conference were opened to the press. Lloyd George, Clémenceau, and Orlando uniting to demand that the executive councils deliberate in secret, it was decided and announced that publicity with regard to their proceedings "must be subject to the limitations necessarily imposed by the difficult and delicate nature of their object." The army of newspaper correspondents was obliged to be content with brief and noncommittal communiqués issued each day, the scanty substance of which had to be supplemented with the gleanings of gossip, semi-official conferences with directors of publicity appointed by each delegation, and occasional interviews with important plenipotentiaries. But in devious ways and for ulterior purposes, reports of secret proceedings frequently reached the printed page, garbled, perhaps, to advance the interests of those who instigated publication.

"The Big Four." In addition to running the conference machinery and determining final terms of peace, the members of the Supreme Council were burdened with complicated and urgent tasks of administration. Each leader had to consider public opinion and political developments at home, problems of demobilization and economic readjustment. The armistice terms with Germany had to be renewed, measures taken to combat the spread of Bolshevism, and to feed, clothe, and house refugees in a dozen regions of Europe. Eastern Europe was in chaos, central Europe was in revolution, and western Europe trembled on the verge of exhaustion and collapse. Everywhere the various nationalist groups were attempting to anticipate the decisions of the Conference by seizing as wide an area of debatable territory as possible. At one time, American observers counted as many as 14 small wars raging in various parts of Europe. The maintenance of political stability and the restoration of economic processes to more normal functioning had to be accomplished in the face of nationalistic quarrels and social unrest that threatened to plunge all Europe into renewed anarchy and to spread the tentacles of Communism westward to the Rhine and the Adriatic.

The position of Woodrow Wilson and his American colleagues was at once highly advantageous and supremely difficult. Mr. Wilson enjoyed great prestige as the head of a wealthy, powerful, and influential nation. The moving eloquence of his lofty declarations on the issues of the World War and the principles of a lasting settlement, together with his vigorous advocacy of a league of free nations cooperating in the fruitful processes of peace, had earned him a numerous following among liberal and labor elements the world over. His programme for world settlement had been officially endorsed as the basis of peace at the time of the armistice negotiations, and he came to Paris determined to secure the application of the twin principles of national self-determination and international cooperation.

Speaking broadly, however, one may say that the representatives of the other Allied Powers did not view with entire favor the policies of Mr. Wilson. They might with diplomatic tact, with reassuring cordiality, agree with Mr. Wilson "in principle," yet their manifest purpose was to negative his projects in detail. Throughout the long negotiations during the first six months of 1919, with the endless proposals and counter-

proposals, discussions, and decisions, the central ideas of the leaders of the different delegations, except possibly the British, remained fairly consistent.

In addition to the aims and interests of the Great Powers, there was another grave obstacle to the realization of a Wilsonian peace, namely, the inordinate ambitions and conflicting claims of the smaller nations now newly vindicated, emancipated, or unified. The representatives of Belgium, Paderewski (the pianist Premier of Poland), Bratiano of Rumania, Pashitch of Serbia, and the gifted Venizelos of Greece, all asked for territory which could only be assigned to them on the inveterate, but, to Wilson's mind, iniquitous principle of the division of the spoils among the victors. It was partly because of these overweening pretensions on the part of the smaller states that Wilson agreed to their exclusion from the Supreme Council of the Allies which directed the Conference.

The Russian Problem. The vexatious and long-unsolved problem of Russia rose to confront the Supreme Council during the early weeks of the Conference. The danger of Bolshevism loomed large on the Eastern horizon, for despite the ring of domestic and foreign enemies which surrounded them, the Communists had managed to maintain their position. Though they were generally regarded as traitors and outlaws, the inherent difficulties of the problem of dealing with them were rendered still more complicated by the divergent aims and sympathies of the Allies. Early in January, 1919, the French, mindful of the billions of francs which they had invested in Russia, urged the utilization of the combined resources of the several countries to overthrow the Bolshevik régime; but the United States and Great Britain refused to furnish any troops for this enterprise. President Wilson strongly opposed Foch's plan for sending troops to Poland, saying he had great doubts whether the spread of Bolshevism could be checked by the use of armed force. He and Lloyd George suggested a plan for holding a conference with the various Russian factions including the *de facto* Bolshevik government. Clémenceau refusing to have his capital contaminated, the place and date of meeting were set for the island of Prinkipo in the Sea of Marmora in February, but to the ill-concealed joy of the French, the project fell through owing to the contemptuous refusal of the counter-revolutionary leaders, Denikin and Kolchak, to consider any proposal for a truce and a conference.

During the several subsequent months, the British and the Americans, recognizing the danger of a policy of drift, persisted in their endeavor to make some sort of settlement regarding Russia, but due to diplomatic tactlessness on the part of the Bolsheviks, hostile comment in the Allied press, the vacillation of Lloyd George in the face of this comment, and the unbending rigor of official France, nothing was accomplished, and the Allies finally reverted to the policy of supporting the Royalist counter-revolutionists. Much valuable time had been wasted and meanwhile the tide of Bolshevism seemed to be sweeping irresistibly westward, into Hungary, into Austria, into Bavaria. The Conference lived throughout under the menacing shadow of impending revolution.

The League of Nations. One of the earliest and perhaps the most vital of the many struggles

at the Peace Conference was the effort to bring into being a league of nations and relate it definitely to the Treaty of Peace. See LEAGUE OF NATIONS. The French were desirous of postponing consideration of a league until the material problems of peace had been settled—new states, boundaries, colonies, disarmament of the enemy, and indemnity; but Wilson placed the league project first on his list of subjects, and in compliance with his demand, the Council of Ten passed a resolution on January 22, sanctioning the creation of a league which should be incorporated "in the general treaty of peace." This resolution was approved by the second plenary session on January 25, and a commission constituted to draft a covenant for the proposed league.

On January 23, Lloyd George, supported by Clémenceau and Sonnino, precipitated an acrimonious discussion of the disposition of the German colonies and the dismemberment of Turkey, which consumed the greater part of a week and generated much heat and bitterness. German sea power and economic rivalry having been crushed, the British moved quickly to their next objective—the division of the spoils of war. Wilson vigorously opposed the move, but had to compromise. It was agreed (January 24) that the colonies should not be restored to Germany, though, on the question of future control, grave differences of opinion developed. The British Premier and the Dominion Prime Ministers demanded outright annexation of the territories which the secret treaties assigned to the British Empire. On January 27, the Japanese announced their unconditional claim to Shantung and the North Pacific islands as per secret-treaty engagements. On January 28, the French demanded annexation "pure and simple" of Togoland and the Cameroons, basing their claims in part upon the existence of secret arrangements with Great Britain and requesting that France "be allowed to continue her work of civilization in tropical Africa." Belgium presently intimated a desire for territorial increases in Africa, and Italy put forward provisional claims based upon the secret Treaty of London.

Wilson, adhering to his programme of "self-determination" with "no annexations," proposed that the areas in question should be held in "trusteeship by the League of Nations through the appointment of mandatories." Smuts of South Africa had originally proposed the application of the mandatory principle to the Turkish and Hapsburg empires, but Wilson in adopting his suggestion widened its application, thereby incurring bitter attacks in the French press which denounced him and his "impracticable ideals."

The British shifted their attack, accepted the mandatory scheme in principle, and attempted to have a preliminary allocation of colonies made before the League came into existence. Hughes of Australia and Massey of New Zealand now uttered a virtual ultimatum, but Wilson stood adamant, and consideration of the problem was postponed pending the drafting of the League Covenant, work upon which was expedited during the first two weeks of February. Simultaneously, other commissions which had been appointed, such as those on various territorial problems, responsibility for the War, reparations, etc., immediately commenced their arduous task of preparing the formulas of settlement.

Following the plenary session of February 14, there was a month's interregnum due to the absence of the "Big Four." Lloyd George was absent from the Conference from February 7 to March 5. His place was temporarily taken by Winston Churchill, perhaps the most militaristic and ultra-imperialistic member of the British cabinet. Mr. Wilson, who left for America on February 14, to attend to administrative duties, did not return to Paris until March 14. Premier Clémenceau, wounded by a French anarchist on February 19, was confined to his home until March 10. Premier Orlando went to Italy for some time leaving his more reactionary colleague, Sonnino, in control.

During the week before his departure, especially on February 7 and February 12, Wilson advocated the immediate imposition upon Germany of military and naval terms providing for her disarmament as a preliminary preparation for Allied demobilization. This would separate military terms from general considerations of peace and tend to remove the Conference from the militarist atmosphere created by the maintenance of large standing armies. Clémenceau bitterly denounced this plan. He desired expansion of the old conditions for Germany, but not demobilization for the Allied Armies. Balfour of Great Britain supported the President in resolutions renewing the old armistice terms for an indefinite period and providing for a preliminary treaty containing the military, naval, and air terms to be drafted immediately by a committee of military experts during Wilson's absence in America; but those delegates who favored imposing general territorial and reparation terms on Germany before considering a League of Nations took advantage of the situation to sidetrack the league project and work for the expansion of the preliminary military, naval, and air treaty, authorized by the resolution of February 12, into a general settlement.

On February 22, Mr. Balfour, responding to pressure by Churchill, introduced a new resolution providing for a preliminary peace treaty with Germany which should include, besides disarmament clauses, the approximate future frontiers of Germany, financial arrangements, post-war economic relations, and responsibility for breaches of the Laws of War. The various commissions which had been constituted to investigate these matters were directed to report not later than March 8 (one week before Wilson's expected return). This resolution received the cordial endorsement of the French and the Japanese. Baron Sonnino of Italy favored the principle, though he was averse to having the German settlements made before Italian claims to Austrian territory were satisfied. Mr. Lansing and Colonel House of the American delegation, desirous of securing a speedy peace, acted against their absent chief's wishes and assented to the project. Lord Milner of the British delegation alone opposed the move, but in vain. The foes of the League secretly rejoiced at this victory, and it was openly declared that the League was shelved. On March 1, Marshal Foch presented a report on the military terms of the Treaty. No sooner, however, had the Council of Ten resolved to frame a general preliminary treaty of peace omitting the League than difficulties were encountered. All sorts of controversies began to crop out. The British and the French differed about the disposition of the German war vessels, the British and Japanese

about former German cables. Lloyd George no sooner returned to Paris than he had a falling-out with Clémenceau. To make matters worse, the Italians objected very vociferously to a quick peace with Germany which left Austrian problems in abeyance.

Such was the situation upon the return of President Wilson to Paris on March 14. In many respects, his visit home had been discouraging, for he had learned that he could not count with certainty upon the American people's support of his peace programme. Circumstances demanding decisive action on his part, the very next day he issued a strong proclamation repudiating American support of the scheme for a preliminary comprehensive peace settlement without the League and announcing that the resolution adopted at the second plenary session on January 25 to the effect that the League should be made an integral part of the general treaty of peace, was of final force.

The French Demands. The somewhat cool reception which Wilson had encountered at home did not pass unnoticed in Europe. Clémenceau and Lloyd George undoubtedly felt that Wilson's domestic support was so unstable that they who could point to the tangible popular mandates of victorious elections and votes of confidence were justified in adopting a stronger tone. These three chief conferees now faced in all its acuteness the problem of finding some basis of unity among themselves upon which the terms of the peace settlement might rest. In January, Wilson had insisted upon immediate steps toward the creation of the League of Nations. The French now resolved to carry through in its entirety their formidable programme of security, reparation, and expansion. It embraced the following points: (1) French military control of the Rhine; (2) a permanent alliance of the Great Powers to help France hold it; (3) erection of a group of smaller allies to menace Germany from the East; (4) territorial reduction of the German Empire; (5) crippling of the German political organization through the encouragement of separatist movements; (6) disarmament of Germany but not of the Allies; (7) a crushing indemnity to cover not merely restoration of northern France but as much of the French war debt as possible; (8) appropriation of German economic resources; (9) a set of commercial agreements preferential to France, prejudicial to Germany. In addition, the French were determined to acquire a large share of the economic opportunities of developing parts of Turkey and the former German colonies.

Wilson recognized that his programme of permanent world peace based upon sound moral principles backed by mutual guarantees was seriously jeopardized by the French demands. He had upset many plans on March 15, by declaring that the League must be an integral part of the treaty. He consistently opposed Marshal Foch's projects of sending military expeditions to coerce Soviet Russia, and on March 17, during the final consideration of the military, naval, and air terms of the treaty, caused the rejection of an elaborate scheme advanced by the French for perpetual control over the military and naval affairs of Germany. Shortly afterward, he was instrumental in again defeating, in the League of Nations Commission, the plan sponsored by M. Bourgeois to make the League practically a military alliance for the defense of France. In addition, while on his way back to France, he

proposals, discussions, and decisions, the central ideas of the leaders of the different delegations, except possibly the British, remained fairly consistent.

In addition to the aims and interests of the Great Powers, there was another grave obstacle to the realization of a Wilsonian peace, namely, the inordinate ambitions and conflicting claims of the smaller nations now newly vindicated, emancipated, or unified. The representatives of Belgium, Paderewski (the pianist Premier of Poland), Bratiano of Rumania, Pashitch of Serbia, and the gifted Venizelos of Greece, all asked for territory which could only be assigned to them on the inveterate, but, to Wilson's mind, iniquitous principle of the division of the spoils among the victors. It was partly because of these overweening pretensions on the part of the smaller states that Wilson agreed to their exclusion from the Supreme Council of the Allies which directed the Conference.

The Russian Problem. The vexatious and long-unresolved problem of Russia rose to confront the Supreme Council during the early weeks of the Conference. The danger of Bolshevism loomed large on the Eastern horizon, for despite the ring of domestic and foreign enemies which surrounded them, the Communists had managed to maintain their position. Though they were generally regarded as traitors and outlaws, the inherent difficulties of the problem of dealing with them were rendered still more complicated by the divergent aims and sympathies of the Allies. Early in January, 1919, the French, mindful of the billions of francs which they had invested in Russia, urged the utilization of the combined resources of the several countries to overthrow the Bolshevik régime; but the United States and Great Britain refused to furnish any troops for this enterprise. President Wilson strongly opposed Foch's plan for sending troops to Poland, saying he had great doubts whether the spread of Bolshevism could be checked by the use of armed force. He and Lloyd George suggested a plan for holding a conference with the various Russian factions including the *de facto* Bolshevik government. Clémenceau refusing to have his capital contaminated, the place and date of meeting were set for the island of Prinipo in the Sea of Marmora in February, but to the ill-concealed joy of the French, the project fell through owing to the contemptuous refusal of the counter-revolutionary leaders, Denikin and Kolchak, to consider any proposal for a truce and a conference.

During the several subsequent months, the British and the Americans, recognizing the danger of a policy of drift, persisted in their endeavor to make some sort of settlement regarding Russia, but due to diplomatic tactlessness on the part of the Bolsheviks, hostile comment in the Allied press, the vacillation of Lloyd George in the face of this comment, and the unbending rigor of official France, nothing was accomplished, and the Allies finally reverted to the policy of supporting the Royalist counter-revolutionists. Much valuable time had been wasted and meanwhile the tide of Bolshevism seemed to be sweeping irresistibly westward, into Hungary, into Austria, into Bavaria. The Conference lived throughout under the menacing shadow of impending revolution.

The League of Nations. One of the earliest and perhaps the most vital of the many struggles

at the Peace Conference was the effort to bring into being a league of nations and relate it definitely to the Treaty of Peace. See LEAGUE OF NATIONS. The French were desirous of postponing consideration of a league until the material problems of peace had been settled—new states, boundaries, colonies, disarmament of the enemy, and indemnity, but Wilson placed the league project first on his list of subjects, and in compliance with his demand, the Council of Ten passed a resolution on January 22, sanctioning the creation of a league which should be incorporated "in the general treaty of peace." This resolution was approved by the second plenary session on January 25, and a commission constituted to draft a covenant for the proposed league.

No sooner, however, had the Council of Ten resolved to frame a general preliminary treaty of peace omitting the League than difficulties were encountered. All sorts of controversies began to crop out. The British and the French differed about the disposition of the German war vessels, the British and Japanese

about former German cables. Lloyd George no sooner returned to Paris than he had a falling-out with Clémenceau. To make matters worse, the Italians objected very vociferously to a quick peace with Germany which left Austrian problems in abeyance.

Such was the situation upon the return of President Wilson to Paris on March 14. In many respects, his visit home had been discouraging, for he had learned that he could not count with certainty upon the American people's support of his peace programme. Circumstances demanding decisive action on his part, the very next day he issued a strong proclamation repudiating American support of the scheme for a preliminary comprehensive peace settlement without the League and announcing that the resolution adopted at the second plenary session on January 25 to the effect that the League should be made an integral part of the general treaty of peace, was of final force.

The French Demands. The somewhat cool reception which Wilson had encountered at home did not pass unnoticed in Europe. Clémenceau and Lloyd George undoubtedly felt that Wilson's domestic support was so unstable that they who could point to the tangible popular mandates of victorious elections and votes of confidence were justified in adopting a stronger tone. These three chief conferees now faced in all its acuteness the problem of finding some basis of unity among themselves upon which the terms of the peace settlement might rest. In January, Wilson had insisted upon immediate steps toward the creation of the League of Nations. The French now resolved to carry through in its entirety their formidable programme of security, reparation, and expansion. It embraced the following points: (1) French military control of the Rhine; (2) a permanent alliance of the Great Powers to help France hold it; (3) erection of a group of smaller allies to menace Germany from the East; (4) territorial reduction of the German Empire; (5) crippling of the German political organization through the encouragement of separatist movements; (6) disarmament of Germany but not of the Allies; (7) a crushing indemnity to cover not merely restoration of northern France but as much of the French war debt as possible; (8) appropriation of German economic resources; (9) a set of commercial agreements preferential to France, prejudicial to Germany. In addition, the French were determined to acquire a large share of the economic opportunities of developing parts of Turkey and the former German colonies.

Wilson recognized that his programme of permanent world peace based upon sound moral principles backed by mutual guarantees was seriously jeopardized by the French demands. He had upset many plans on March 15, by declaring that the League must be an integral part of the treaty. He consistently opposed Marshal Foch's projects of sending military expeditions to coerce Soviet Russia, and on March 17, during the final consideration of the military, naval, and air terms of the treaty, caused the rejection of an elaborate scheme advanced by the French for perpetual control over the military and naval affairs of Germany. Shortly afterward, he was instrumental in again defeating, in the League of Nations Commission, the plan sponsored by M. Bourgeois to make the League practically a military alliance for the defense of France. In addition, while on his way back to France, he

had refused, by wireless, to consent to the French proposal to include the entire costs of the War in Germany's reparations bill. Such actions, though maintaining his position, served to irritate and consolidate the opposition.

The French determined not to yield on any more points. Though unanimously assured of the return of Alsace-Lorraine, political, military, and economic motives impelled them to demand a more complete "rectification" of their eastern frontier. The secret agreement of February, 1917, with Russia had assigned them, first, outright annexation of the entire iron district of Lorraine and the entire coal district of the Saar Valley, and, second, the separation from Germany of the remaining territories on the left bank of the Rhine and their erection into an autonomous neutral state to be occupied by French troops pending final fulfillment of all conditions of peace to be imposed upon the enemy. With minor modifications, the execution of this agreement, together with a proposal for an indefinitely extended inter-Allied control of the Rhine bridges, was vigorously advocated by the French delegation at the Conference, and the debate on this subject of fundamental importance was keen and protracted, lasting off and on for the first six months of 1919.

On March 14, Wilson and Lloyd George offered to pledge their respective countries to aid the French in case of an unprovoked attack by Germany. Clémenceau accepted this extraordinary guarantee with much gratitude, but insisted that it supplement rather than supersede the French plan for indefinite occupation of the left bank and military control of the Rhine. On March 27, the French finally presented their definitive claim to the Saar, pared down to an irreducible minimum providing first for political annexation of that part of the Saar Basin which had belonged to France under the frontier of 1814 but had been relinquished to Prussia as an additional penalty after Napoleon's débâcle at Waterloo, and, second, for full French ownership of the mines in the adjoining regions. The whole controversy on this issue, together with disputes about reparation, amendments to the Covenant of the League of Nations, and other points, came to a head late in March. From March 25 to April 7, the Conference seemed to have reached a standstill as the major plenipotentiaries battled for supremacy. Affairs had reached an impasse.

The opening days of April have truly merited the caption, "the Peace Conference's blackest hour." In the Council of Four, Clémenceau was at loggerheads with Wilson and Lloyd George and threatened to resign unless his demands were granted. His fall would probably have resulted in an even more obstinate French resistance. In the sessions of the League of Nations Commission, the French were insisting on the adoption of amendments favoring militarization of the League and the maintenance of French security. There were grave premonitory rumblings of future disputes with the Italians and Japanese over their respective territorial claims. The inspired French press and certain sections of the English and Italian press uniting in a vituperative attack upon Wilson and to some extent upon Lloyd George, anathematized the former as a pro-German and the sole obstacle to a speedy and satisfactory peace. On April 3, the President succumbed to physical exhaustion and for

four days was confined to his bed. On April 4, came news of renewed disorders and aggressive Bolshevik projects in Hungary; on the same day, King Albert of Belgium arrived to insist upon Belgian priority in reparations payments. On April 5, it was learned that Bavaria had embraced Bolshevism and on the sixth, there were socialist demonstrations in the streets of Paris.

Wilson determined to force a showdown. His first action upon leaving his sick-bed was to order the *George Washington* to sail for Brest immediately. This was his ultimatum: either the French had to recede from their extreme demands or he would leave the Conference. The result was an era of compromise. Working under the necessity of preserving Allied solidarity and preventing a disruption of the Conference, Wilson and Clémenceau gradually fought out the problems of French security and reparation. On April 10, a solution of the Saar Basin question was attained. (See SAAR BASIN.) On April 16, Wilson and Lloyd George agreed to a 15-year occupation of the left bank of the Rhine, together with Allied control of the three principal bridge-heads, the demilitarization of all this territory and also of a zone stretching 50 kilometers east of the river. Simultaneously, it was definitely decided to sign the three-power defensive alliance as an additional guarantee of French security, though in so doing, Wilson laid himself open to serious charges of inconsistency, as he had hitherto opposed special alliances within the general family of the League of Nations. Meanwhile, in the final sessions of the League Commission, April 10 and 11, Wilson carried through certain American amendments that he considered necessary to meet domestic opposition, but with Clémenceau's consent, the proposed French amendments were rejected. On April 12, a compromise was reached on the reparations issue. See REPARATIONS. These decisions in regard to reparations, the Saar Valley, and the left bank of the Rhine completed the main outlines of the settlement with France. Though the worst period of the crisis was thereby weathered, the compromises on these vital issues satisfied no nation and extraordinary attempts were subsequently made to evade or modify them, for the French never stopped fighting for their full programme, and the British and the Americans, regretting their concessions, endeavored to secure a reconsideration. However, by April 14, sufficiently comprehensive agreements had been reached by Wilson, Clémenceau, and Lloyd George to justify summoning the German delegation to Versailles; but three weeks were yet to elapse before the tentative draft treaty was completed and submitted to the enemy plenipotentiaries, for barely had the worst period of the French crisis been safely weathered when another storm—the Italian crisis—burst upon the Conference.

The Italian Demands. The Italians had been growing restive under the apprehension that the German terms would be settled before they had a chance to bargain for concessions in the Adriatic, Asia Minor, and elsewhere as the price of their approval of the settlement. Italian claims for territory were based primarily upon the secret Treaty of London of April, 1915, by which Italy was promised the southern part of Austrian Tyrol, up to Brenner Pass and including the Bozen district with some 200,000 Austro-Germans, in addition to the ethnograph-

ically Italian region of Trentino; also Trieste; Gorizia, Gradisca, and Istria; a majority of whose inhabitants were Slavic; part of Dalmatia, with all the best harbors except Fiume on the eastern side of the Adriatic; the town and district of Valona in Albania, the Dodecanese Islands in the eastern Mediterranean, wholly inhabited by Greeks; imperialistic compensation in Africa and Asia Minor; and "a share of the war-indemnity." Subsequent secret arrangements, notably that of St. Jean de Maurienne in April, 1917, had elaborated prospective Italian gains in the Turkish Empire.

The Treaty of London, as its terms gradually became known, had a poisoning and disillusioning effect all through the Balkans, and proved to be one of the chief obstacles to a speedy and satisfactory settlement at Paris. "More actual time was devoted by the Council of Four and other councils and commissions to the controversies which raged around this treaty than to any other single subject discussed." In a session of the Supreme War Council on Nov. 4, 1918, at the time of the armistice negotiations, Premier Orlando had made a reservation on Point Nine of Wilson's Fourteen Points on the readjustment of Italian frontiers "along clearly recognizable lines of nationality," but this was not incorporated in the note to Germany on November 5, on the ground that it concerned the peace with Austria-Hungary, not with Germany. The Italians not only refused to abide by the Fourteen Points, but went a step beyond the Treaty of London and claimed, in addition, the port of Fiume, the annexation of which they had expressly, though it appears unwillingly, renounced in 1915. At that time, it was agreed to offer Fiume to Croatia, Serbia, and Montenegro as compensation for certain sacrifices of Serbian territory to be utilized in enticing Bulgaria into the War on the side of the Allies. The latter project falling through, Italy revived her claim to Fiume in order to secure undisputed economic domination of the Adriatic and to prevent any potential rivalry on the part of Yugoslavia. See FILME-ADRIATIC CONTROVERSY.

The Japanese Demands. Contemporaneously with the Italian crisis over Fiume, there had taken place a sharp encounter with the Japanese over Shantung. The Mikado's representatives had hitherto confined themselves largely to silent observation of the wranglings of other nations and to a protracted though fruitless effort to secure insertion in the League of Nations Covenant of the principles of racial equality. Smarting under their defeat on this issue, the Japanese began strenuously to urge their claims to imperialistic aggrandizement in the Far East. Their diplomatic position was well-nigh unpregnable. A secret agreement with Great Britain of February, 1917, subsequently approved by France, Russia, and Italy, assured Japan of the acquisition of Germany's rights in Shantung, and island possessions in the North Pacific, those south of the equator being assigned to the British. Several secret agreements negotiated with China at the point of the bayonet in 1915 and September, 1918, had secured reluctant Chinese assent to the Japanese plan for eventual restoration of Shantung to China only upon conditions favoring the enhancement of Japanese interests in Shantung and Manchuria. The Chinese having consented to these arrangements only under duress (see CHINA, *History*, and JAPAN, *History*), now asked the complete abro-

gation of all these old treaties and the direct restoration of Shantung without the intermediation or interference of the Japanese.

The Japanese, bitterly denouncing Chinese participation in the discussion of their claims, and grimly resolved to stand their ground, demanded the absolute surrender to themselves of the former German "rights, privileges, and concessions" in Shantung, after which they were to be left free to carry out the provisions of the treaty of 1915 and the arrangements of 1918. They summarily rejected a proposal made by Secretary Lansing in the Council of Foreign Ministers on April 15, and strongly supported by President Wilson in the Council of Four, providing for the blanket cession of all German rights in China to the Allied and Associated Powers for subsequent disposition. Lloyd George adduced the secret treaty of 1917 in justifying the Japanese claims, but his loosely made suggestion for a League of Nations mandate for Shantung was rebuffed by them. The Japanese peremptorily demanded an immediate and definite settlement of the problem in accordance with their stipulations since otherwise they had strict orders from home not to sign the treaty. The departure of the Italians redoubled the gravity and effectiveness of their threat to leave the Conference. The Belgians were simultaneously manifesting discontent over the reparations settlement and a complete break-up again seemed imminent.

Against the strong advice of his advisers and fellow-plenipotentiaries, including Secretary Lansing and General Bliss, Wilson finally decided to yield to the practical considerations of the moment and on April 30, it was agreed that Shantung should be ceded to Japan in the actual treaty, but that Japan in a supplementary verbal agreement was specifically to reaffirm her promise to return it to China under more explicitly defined conditions. This compromise solution saved the day, but was satisfactory to no one except the Japanese. It embittered the Chinese and led to their refusal to sign the treaty. It disheartened Wilson more than any other decision at the Conference. It stirred up great criticism in America and furnished a formidable weapon of opposition to the treaty there. Not until the time of the Washington Conference was an amelioration of the settlement made which mollified the United States and China. See SHANTUNG AND WASHINGTON CONFERENCE.

The Polish Demands. On the contentious issues of Fiume and Shantung, Wilson received scant support from his colleagues in the Council of Four, but when it came to the extravagant Polish demands supported by the French, Lloyd George entered the diplomatic lists in the guise of an embattled advocate of justice and moderation. In 1917 France in her secret arrangements with Russia had agreed to allow the Czar's government a free hand in drawing Germany's western boundaries, i.e. in annexing Prussian and Austrian Poland, but the advent of revolution in Russia and the subsequent régime of the Bolsheviks profoundly altered French policy. Having lost their powerful ally in the East and being interested in the creation of a ring of buffer states around Germany, the French argued for a great and strong Poland, which would not only hem in the Germans on the East but also form a link in the *cordon sanitaire* to be forged around Bolshevik Russia. The British,

while committed to the restoration of Polish statehood, refused to countenance the projects of aggrandizement advanced by the Poles and the French, as they served no direct British interest and promised to cause unrest and possibly war in Eastern Europe. The Territorial Commission appointed to consider the problem of Poland recommended the cession to her of almost the whole of the provinces of Posen and West Prussia which had anciently constituted parts of the Kingdom of Poland, together with the district of Marienwerder controlling the railroad from Danzig to Warsaw. Poland was also to get the greater part of Upper Silesia, which had not been Polish for centuries. Lloyd George strongly opposed the transfer of 2,000,000 Germans to Polish rule and, supported by President Wilson, he secured a decision allowing a plebiscite in Marienwerder, and making Danzig a free city under the League of Nations, though subject to Poland in customs regulations and conduct of foreign relations.

The essential terms of the treaty were now complete. On April 28, at the fifth plenary session, the League of Nations Covenant and the International Labor Charter were adopted by the Conference, and on May 6, despite a strong undercurrent of dissatisfaction among the smaller powers "with special interests" who felt that their views had not been sufficiently considered, a summary digest of the whole treaty was read and approved.

German Reception of the Treaty. Headed by Count Brockdorff-Rantzau, foreign secretary of the republican government at Berlin, the German plenipotentiaries arrived at Versailles on April 29. Here, on May 7, the Preliminary Conference was transformed into a definitive Peace Congress and at a ceremonial meeting the proposed treaty was formally transmitted to the German delegation by Clémenceau whose tart speech, declaring that the War had cost the victors too much to allow the remission of any precautions or guarantees necessary to ensure a lasting peace, elicited from Brockdorff-Rantzau an extremely defiant and tactless reply marked by bitter denunciation of the Allies and a vigorous denial that Germany was solely responsible for the War.

Seven weeks of uncertainty ensued, taken up with the analysis of German protests, the formulation of the Austrian peace treaty (see below), and the last great crisis that preceded the signature. Oral discussion being barred, the Germans, commencing May 10, submitted an extended series of notes criticizing various parts of the treaty, and on May 29 advanced an elaborate set of counter-proposals. Complaining that the principles of the Armistice under which Germany had laid down her arms had been violated in letter and spirit, they asserted that the terms imposed upon their now thoroughly democratic government were intolerably severe. They demanded a plebiscite to determine the future status of Alsace-Lorraine, and suggested that, instead of ceding West Prussia, Danzig, and Memel, they should be allowed to make Danzig, Königsberg, and Memel free ports under German sovereignty. They afforded fixed annual supplies of coal to France in lieu of the Saar mines and argued that the retention of Upper Silesia was absolutely necessary if Germany were to fulfill her obligations. They requested that Germany be admitted to the League of Nations immediately without conditions, and pro-

posed that she retain her colonies under a League mandate. They advocated general instead of unilateral disarmament and asked the Allies to abolish compulsory military service in two years.

These and numerous other suggested changes and interpretations were considered by the Allied Councils and 13 special committees. Of great significance was an eleventh-hour attempt on the part of Lloyd George to secure modification of the terms of peace. Publication of a digest of the treaty had elicited vociferous denunciation of its provisions in liberal and labor circles in Great Britain and to some extent in the United States. Certain plenipotentiaries and experts in the British and American delegations at Paris were emphatic in their criticisms. In Germany, all parties denounced the treaty and huge demonstrations of protest led to increasing anxiety about its possible rejection. Alarmed by the spread of dissatisfaction and fearful lest the Germans would refuse to sign, the consummate politician, Lloyd George, who on May 9 had been stronger than any of the others for coercion, swung suddenly toward the other extreme and began to demand somewhat radical revisions of the treaty. He particularly attacked the provisions regarding the army of occupation and the Silesian settlement. Clémenceau, criticized in France for having already yielded too much, convinced as always that the Germans understood nothing but force, and believing that once a few concessions were made they would insolently demand more, bristled with opposition and refused to agree to a reconsideration.

Lloyd George turned to the Americans for support. Wilson, having struggled all through the Conference to abate excessive British, French, Italian, Japanese, and Polish demands, was not impressed by the British Premier's periodic changes of position. On June 1, Lloyd George consulted his cabinet at a special meeting convened in Paris, and the very next day he threatened to go home and lay the whole matter before Parliament if Clémenceau did not consent to changes. The French Premier, himself facing a ministerial crisis, declined to budge. Wilson, at a special meeting of the American delegation on June 3, announced that he was strongly in favor of making any changes that would ensure more complete justice, but he opposed granting any last-minute concessions merely to placate the enemy. He feared that the resumption of conversation about French security and other points would imperil the whole delicate structure of the settlement. With the President's consent, the American experts did urge that a definite and moderate sum of reparation be fixed; but Lloyd George, remembering his election pledge about recovering the costs of the war—some \$120,000,000,000—frankly opposed the move. On June 16, however, he secured a convention providing for supreme civil, rather than military, control of the occupied territory and a declaration limiting the cost of the Army of Occupation to be assessed upon the enemy. The Allied reply to the German observations on the conditions of the Peace which was dispatched on the same day, registered certain additional modifications including the requirement of a plebiscite for Upper Silesia, a slight readjustment of Poland's western frontier, a retardation of the required reduction of the German Army, and a provision for the collaboration of a German commission in discussing methods of reparation payments.

Despite these concessions, the Allied reply was in effect an ultimatum which called for Germany's acceptance or refusal on or before June 23.

The return of the German delegates from Versailles with the modified treaty conditions precipitated a ministerial crisis at Berlin. The Scheidemann government, which had fomented resistance to the treaty and threatened not to accept it, resigned on June 21, and was replaced by a transitional ministry under Adolph Bauer pledged to acceptance of the treaty. An effort to secure the omission of the articles requiring the confession of war guilt and the surrender of war criminals met with an absolute refusal by the Supreme Council to consider any further modifications and a demand for immediate compliance. Marshal Foch was ordered to advance on Berlin with the Allied armies should the German government not submit within the time limit, and preparations were made for tightening the blockade. The Germans reluctantly gave way. On June 23, the National Assembly at Weimar voted 237 to 138 to accept the treaty unconditionally and the next day the Allied Supreme Council was informed of the fact. Dr. Hermann Muller, the new foreign secretary, and Dr. Johannes Bell, a colonial secretary, were prevailed upon to act as plenipotentiaries in place of Brockdorff-Rantzau and his colleagues. On June 28, 1919, five years to a day after the assassination of the Austrian Archduke Francis Ferdinand, the two representatives of the new German Republic attached their signatures to the Treaty of Versailles which, being signed by delegates of all the Allied nations except China, officially terminated the World War.

THE TREATY OF VERSAILLES

The Treaty of Versailles, as signed on June 28, 1919, revolutionized the international status of Germany, territorially, politically, militarily and economically. By its terms, Germany lost her navy, her merchant marine, her colonial empire, invaluable natural resources; and her army was reduced to impotence. The first 26 articles of the Treaty constituted the Covenant of the League of Nations, but from this Germany was to be temporarily excluded. (See LEAGUE OF NATIONS.) The rest of the large-sized volume of 440 articles and annexes set forth more specific conditions of peace.

Political Terms. Germany recognized the complete independence and unconditional sovereignty of Belgium, Poland, Czechoslovakia, and German Austria, denounced the treaties of Brest-Litovsk and Bucharest, and agreed to allow the Allies carte blanche in dealing with Russia, Turkey, Bulgaria, Hungary, and Austria.

Territorial Terms. Germany lost all of her overseas possessions and some 27,500 square miles, or a trifle over 13 per cent, of her European domain. Alsace-Lorraine was returned to France, and the Saar Basin placed under a League of Nations Commission for 15 years as described above. Belgium received the small districts of Eupen, Malmédy, and Moresnet. Under plebiscites held in February and March, 1920, to determine the status of Northern and Central Schleswig, the former, comprising some 1537 square miles, was reunited with Denmark, but the latter remained with Germany. To Poland were ceded large parts of the provinces of Posen and West Prussia. In July, 1920, plebiscites in

southern East Prussia and the Marienwerder district of West Prussia produced very substantial majorities for Germany. The plebiscite in Upper Silesia in March, 1921, gave a majority for Germany, but to the disappointment of the Germans, in October, 1921, the Council of the League of Nations, having been invited to settle the controversy, awarded the richest part of the region, some 12.55 square miles, to Poland. A small portion, 110 square miles, of Upper Silesia was ceded to Czechoslovakia on July 28, 1920. The port of Memel with adjacent territory was ceded to the Allies for ultimate transfer to Lithuania. The port of Danzig was likewise ceded to the Principal Allied and Associated Powers, who in accordance with the agreement described above recognized Danzig as a free city administered under the League of Nations but subject to Polish jurisdiction as regards customs and foreign relations. Germany renounced all special rights and privileges in China, Egypt, Siam, Siberia, Morocco, and Turkey. Her rights and privileges in Shantung were ceded to Japan. (See WASHINGTON CONFERENCE for eventual Japanese settlement with China.) Germany ceded to the Principal Powers all of her remaining overseas possessions which in accordance with Article 22 of the League of Nations Covenant were to be administered by the mandatories of the League. Already on May 6, 1919, the Supreme Council had made a provisional distribution of mandates. Great Britain was to receive German East Africa. On May 30, however, the British government resigned to Belgium the districts of Urundi and Ruanda contiguous to Belgian Congo to be administered under separate mandate. German Southwest Africa went to the British dominion of South Africa. France and Great Britain were to receive a joint mandate over Cameroon and Togoland with permission to partition them by mutual agreement. German New Guinea was assigned to Australia, German Samoa to New Zealand, the island of Nauru to Great Britain, and the German islands north of the equator to Japan. On Feb. 21, 1921, President Wilson announced that the United States could not agree to have the cable centre on the island of Yap (q.v.) assigned to Japanese control and a new arrangement in regard to it was made at the time of the Washington Conference. For an account of the mandatory system, see MANDATES and also LEAGUE OF NATIONS.

Military Terms. Germany was required to abolish compulsory universal service; to reduce her army to 96,000 men and 4000 officers recruited by voluntary enlistment, to demilitarize all the territory on the left bank of the Rhine and also that on the right bank to a depth of 150 kilometers; to stop all importation, exportation, and nearly all production of war material, to limit her navy to six battleships, six light cruisers, and 12 torpedo boats, with no submarines, the naval personnel not to exceed 15,000 officers and men; and to abandon all military and naval aviation by Oct. 1, 1919. The execution of most of these provisions was to be supervised by an inter-Allied Commission of Control endowed with full powers of inspection and investigation. (See below, *Continuation Conferences*.) In addition, she agreed to demilitarize the island of Helgoland, to open the Kiel Canal to all nations, to surrender her 14 submarine cables, and, last but not least, to permit the trial of her ex-Emperor by an in-

ternational high court on the charge of "a supreme offense against international morality," and of other officials for violation of the laws and customs of war.

Economic Terms. The economic and reparation provisions of the treaty were exceedingly drastic and constituted a perplexing problem which more than any other aspect of the Treaty of Versailles has subsequently disturbed the peace of the world. (See REPARATIONS.) In addition to paying heavy indemnities, the Germans were required to grant nonreciprocal most-favored-nation treatment to the commerce of Allied nations for a period of years. As guarantees for the payment of reparations, the Allies were to maintain military occupation of the left bank of the Rhine and of the bridgeheads at Cologne, Coblenz, and Mainz, with provisions for the evacuation of the latter three districts at five-year intervals should Germany be duly fulfilling her obligations. Including the Saar Basin (742 square miles), a total area of 12,338 square miles was to be occupied by the Allies and the subsequent seizure of the Ruhr by the French in 1923 added nearly a thousand more.

THE AUSTRIAN TREATY OF ST. GERMAIN

With the signing of the Treaty of Versailles with Germany on June 28, the major task of the Peace Conference was concluded and the most important plenipotentiaries, except Premier Clémenceau, departed from Paris leaving subordinate statesmen and diplomats in charge. Mr. Lansing, succeeding Mr. Wilson as head of the American delegation, stayed until July, when he withdrew, leaving Mr. Polk, Under-Secretary of State, to act for him. Mr. Balfour became the chief of the British delegation, but in September he, too, departed, surrendering the leadership to Sir Eyre Crowe. Premier Orlando's cabinet had fallen from power on June 19 as a result of Italian dissatisfaction over the Adriatic negotiations and his successor, Signor Nitti, refrained from visiting Paris.

Claims of the Succession States. Although giving priority to the settlement with Germany during the first six months of 1919, the Peace Conference had simultaneously taken under consideration the problem of arranging terms of peace with Austria, Hungary, Bulgaria, and Turkey. It was planned to have the five treaties form part of the same general settlement, each beginning with the League of Nations Covenant, and employing as far as possible the same form and phraseology. The second treaty to be drafted and signed was that with Austria. Italy was the only Great Power with vital interests at stake, although France was insistent on preventing the union of Austria with Germany and carried her point during the era of compromise following the French crisis in April. She also favored a confederation of satellite states on the Danube to act as a bulwark against Germany in the southeast. To the numerous other "heirs of the Hapsburgs," however, Czechoslovakia, Poland, and the Balkan Allies, the disposition of Austrian territory was of supreme importance. As a result of the nationalistic revolution in the Dual Monarchy, the division had already taken place along broad lines by the time the Peace Conference met; but problems of frontiers still remained, some of which occasioned most violent conflicts. In Silesia, Poles and Czechs struggled for the con-

trol of the district of Teschen with its invaluable coal mines. For discussion of this problem, see TESCHEN. In the Adriatic, Italians and Jugoslavs came to swords' points over Dalmatia. In the Klagenfurt Basin, Italians, Jugoslavs, and German Austrians were ready to come to blows. The conflicting claims and charges of the various litigants, each of which viewed affairs through the colored prism of its own nationalistic ambition, rendered extremely difficult the task which confronted the Supreme Council regarding Austria in the spring of 1919.

Despairing of having the disputants arrive at amicable agreements among themselves, the Council of Ten constituted territorial commissions in February, 1919, to study the boundary problems of the various states except Italy. By the time the reports of these commissions were ready, the Council of Four had superseded the Ten and with few exceptions the unanimous recommendations of the commissions were approved without alteration. Over points in dispute, the Four worked earnestly, paying little attention to the small states. President Wilson finally acknowledged Italy's claim to the Brenner frontier, involving though it did the expatriation of over 200,000 Germans. The approximate boundaries of Czechoslovakia and Jugoslavia were settled in May, the former being assigned regions of Bohemia inhabited by 3,000,000 Germans, the transfer being dictated by economic and strategic considerations.

Work was rushed on the Austrian treaty so that it might be in the hands of the Austrians before the treaty with Germany was signed, for each contained the provision prohibiting union of Austria with Germany, each was to contribute to the territorial resurrection of Poland, and last but not least, Italians were insistent upon a simultaneous settlement with the two countries. An incomplete draft of the treaty was presented to the seventh plenary session with the intention of communicating it to the Austrians on the following day, but the plenipotentiaries of the Succession and Balkan States demanded time to study the document. Two days later at the eighth plenary session, Premier Bratiano of Rumania, supported by the Polish, Czechoslovak, and Jugoslav representatives, protested against having the Great Powers prescribe regulations for the protection of minorities within their separate states. Mr. Wilson answered that the Principal Powers could not be expected to guarantee the independence and integrity of the new states unless the latter would on their side guarantee equality of rights to racial or religious minorities transferred to their control under the peace settlement. Rumania and Jugoslavia, though greatly enlarged by the new readjustments, were old states and denied the right of the Conference to limit their sovereignty by special restrictions. Venizelos of Greece suggested that a joint meeting of the Council of Four with the smaller Allies ought to be held to consider the legitimate anxieties of the latter; but all objections were overruled by Clémenceau, Lloyd George, and Wilson.

The Austrian delegates had arrived at St. Germain near Paris on May 14, and on June 2, the preliminary draft of the treaty was transmitted to them. On July 20, the Supreme Council transmitted a more complete and revised draft of the treaty to the Austrians, informing

them that Burgenland, or German West Hungary, for whose annexation they had asked would be ceded without a plebiscite. (See **BURGENLAND**.) The Austrians formulated and presented their observations on the revised terms on August 6, still protesting against the patent violations of the principle of self-determination. In their final reply of Sept. 2, 1919, the Allied and Associated Powers made few additional concessions—perhaps the most noteworthy being the return to Austria of the important railway junction of Radkersburg originally assigned to Jugoslavia. On September 8, the Austrian National Assembly authorized its delegates to sign the treaty, and this ceremony took place at St. Germain on September 10, but the opposition of Rumania and Jugoslavia to acceptance of Minorities Treaties to which they would have pledged themselves by underwriting the Austrian treaty led them to refuse to sign, until some time later. Though the Austrian National Assembly had already perforce ratified the Treaty of St. Germain on October 17, ratifications were not exchanged until July, 1920.

Political and Military Terms. The Treaty of St. Germain required Austria to recognize the complete independence of Jugoslavia, Czechoslovakia, Poland, and Hungary, to make liberal cessions of territory to various victorious neighbors including Italy, and to accept elaborate regulations for the protection of such racial, religious, or linguistic minorities as remained within her much-diminished territorial confines. As described above, the cession of lands to Italy included not only *Italia Irredenta* but also for strategic reasons the Brenner Pass frontier in the Tyrol with over 200,000 German inhabitants. One-fourth of the inhabitants of the new state of Czechoslovakia were Germans in Bohemia and Moravia, this violation of the principle of self-determination being motivated by economic and strategic considerations and justified on historical grounds. Eastern Galicia, inhabited by a Ruthenian majority with a strong Polish minority, had been bitterly contested between these two nationalities, and had been seized by the Poles during the Conference, it was renounced by Austria in favor of the Principal Allied and Associated Powers, who acquiesced in Poland's *de facto* possession of the region, without definitively settling the question of sovereignty. The Duchy of Bukovina, with 300,000 Ruthenian and 273,000 Rumanian inhabitants, was renounced by Austria in favor of Rumania.

As a result of the Klagenfurt plebiscite of October, 1920, the whole of that much-contested area remained Austrian. An additional solace was the award of German West Hungary (Burgenland). Thus, through revolution and dismemberment, the State of Austria shrank from its pre-war expanse of 116,000 square miles to the diminutive area of 32,000 square miles. The Austrian Army was reduced to 30,000 men recruited by long-term voluntary enlistments; military aeronautics were prohibited; all war vessels were surrendered and future maintenance of naval forces obviated through loss of maritime ports. Commercial clauses of general similarity to those in the Treaty of Versailles were imposed upon Austria. She was guaranteed free access to the Adriatic. A commission on which Great Britain, France, Italy, Rumania, and the riparian states were represented was established to regulate traffic on

the Danube. All transferred territories were made responsible for their fair shares of the pre-war Austrian debt. Austria was obligated to pay such indemnities as might be prescribed by the International Reparations Commission, but so crippled was the new Republic politically, industrially, and commercially that in a few years intervention by the League of Nations proved necessary to straighten out her finances. See **LEAGUE OF NATIONS**; **AUSTRIA**; **REPARATIONS**.

THE BULGARIAN TREATY OF NEUILLY

Following the settlement with Austria, the Supreme Council devoted more attention to the task of arranging peace with Bulgaria—the first of the Central Powers to lay down her arms at the end of the World War. The protracted delay which intervened between the arrival of the Bulgarian delegation on July 26 and the formal presentation of a preliminary draft of their treaty on Sept. 19, 1919, led to considerable exasperation on the part of their truculent leader, M. Theodoroff. Learning the substance of the treaty conditions from the press, he lodged strenuous objections with the Supreme Council on September 2, denying that Bulgaria was the one “guilty, imperialistic, and aggressive nation” in the Balkans and protesting against the violations of the principle of self-determination prefigured in the proposed dismemberment of Bulgaria.

These objections to the territorial terms were reiterated in the formal observations submitted on October 24. The Bulgarians also complained about their exclusion from the League of Nations and demanded changes in the military provisions so as to permit the retention of conscription. The reply of the Supreme Council on November 3 promised speedy admission to the League, but otherwise made no substantial concessions. Further remonstrances from the Bulgarians had no effect other than the issuance of an ultimatum on November 5 demanding acceptance or rejection in 10 days. Meanwhile in Bulgaria, a general election held in August had resulted adversely to the Government and a new ministry recruited from the Agrarian Party under the leadership of M. Stambulsky came into power in the midst of the agitation about the treaty. On November 13, the Bulgarians still protesting yielded to superior force. Premier Stambulsky declared that he had “no illusions” and would sign “even a bad peace.” He was the sole signatory for Bulgaria when the Treaty was signed at Neuilly on November 27. Jugoslavia and Rumania were not permitted to sign until they had accepted the Minorities Treaties supplementary to the Austrian Treaty. Ratifications of the Treaty of Neuilly were exchanged on Aug. 9, 1920.

Many clauses of the treaty were identical with those of the Treaties of Versailles and St. Germain, notably the League of Nations Covenant, the Labor Convention, aeronautical provisions, penalties, etc. Politically, Bulgaria was required to recognize the independence of Jugoslavia, to renounce the benefits of the Treaties of Bucharest and Brest-Litovsk and to accept regulations for the protection of racial, national, religious, and linguistic minorities. Territorially, Bulgaria was deprived of most of her gains resulting from the Balkan Wars and all of her conquests made during the World War. The Dobruja went to Rumania, as before 1914, leav-

ing for future consideration the problem of inducing Rumania to relinquish such Bulgarian districts as it included. Thrace was ceded to the Principal Powers for ultimate assignment to Greece. Particularly embittering to Bulgaria was the loss of the small districts of Tsaribrod, Bosilegrad, Strumitsa, and Timok Valley—all predominantly Bulgarian but all transferred to Yugoslavia for strategic reasons. Yugoslavia had suffered grievously from Bulgarian attack and domination during the recent War, and in the bitterness of retaliation demanded other territorial annexations, but these were denied to her on ethnographic grounds. A small district of former Turkey was added to Bulgaria on the southeast. Bulgaria was obliged to abandon conscription, to reduce her army to 20,000 officers and men together with gendarmes and other police to a number not exceeding 13,000. All war vessels except four torpedo boats and six motor boats were to be surrendered or destroyed, military aeronautics prohibited, and the manufacture of munitions strictly limited. In addition, Bulgaria was to pay extensive reparations (two and a quarter billion gold francs in 37 years), supply live stock for devastated areas, and ship large allotments of coal to Yugoslavia annually for five years. Commercially, she agreed to give the Allied and Associated Powers most-favored-nation treatment and freedom of transit for goods and persons, receiving in return the guarantee of freedom of transit to the Aegean with which her territory was no longer contiguous.

THE HUNGARIAN TREATY OF TRIANON

The conclusion of peace with the Hungarian wing of the old Hapsburg Dual Monarchy was a protracted and difficult task, complicated alike by perplexing boundary disputes among the victors and by political instability and intransigence upon the part of the vanquished. The democratic republican régime established in Hungary by the revolution of November, 1918, was supplanted in March, 1919, by a Bolshevik dictatorship on the Russian Soviet model just at the most critical moment of the Paris Peace Conference. (See above.) The Communist leader, Béla Kun, defied the Supreme Council during the crucial months of April, May, and June. However, due to the exigencies of diplomacy and the nationalistic ambitions of the Balkan Powers, early decisions were arrived at regarding the territorial dismemberment of Hungary. Great difficulty was encountered in reconciling and adjusting the divergent interests and conflicting claims of both Yugoslavia and Rumania.

The secret treaty of August, 1916, which purchased Rumania's entrance into the World War, proved a source of much bickering and bitterness. Premier Brătianu of Rumania asked for the complete fulfillment of treaty stipulations, but the Big Four, arguing that all previous commitments were cancelled by Rumania's signature of the Treaty of Bucharest in May, 1918, refused to accede to his demands. The Banat of Temesvar (q.v.), all of which had been assigned to Rumania by the Treaty of 1916, was now partitioned between her and Yugoslavia. Despite reiterated Rumanian claims and objections, the terms of this settlement were definitely arranged in June, 1919. On June 13, the Supreme Council informed the Hungarians of the proposed cessions of territory to Rumania, Yugoslavia,

and Czechoslovakia, and on July 20, as recounted above, the rich district of Burgenland (German West Hungary) was promised to Austria. For Hungarian political developments during this period, see HUNGARY. On January 7, the Hungarian delegates, after the establishment of a home government satisfactory to the Supreme Council, arrived at Trianon, France, and here January 15 they were formally presented with a preliminary draft of their treaty, the main terms of which had been ready as early as September, 1919.

Council of Ambassadors. One week later—on Jan. 21, 1920—the Supreme Council convened for the last time and the Peace Conference of Paris was thus formally dissolved approximately one year after its sessions had begun. To the Council of Allied Ambassadors in Paris was intrusted the task of completing the settlements with the remaining enemy powers of Hungary and Turkey though periodic conferences of the Allied premiers were shortly to be inaugurated for the purpose of dealing with other unliquidated problems of the peace. See below: *Continuation Conferences.*

On February 12, the Hungarians submitted a set of observations and counter-proposals which breathed a spirit of hostility and recalcitrance. They demanded the retention of the Czechlers (Magyars) of East Transylvania, and asked that no territories be transferred without plebiscites according the inhabitants the right of self-determination. All transferred territories were to be retained in the Hungarian customs régime for a period of years, and better safeguards provided for the protection of Hungarian minorities. The Allies were in no mood to make concessions. The strong reactionary nationalist and monarchist sentiment rampant in Hungary elicited a joint statement from Great Britain, France, and Italy on February 12 to the effect that a Hapsburg restoration would *ipso facto* violate one of the fundamental conditions of the peace settlement and call forth condign punishment. The new Parliament elected early in 1920 designated Admiral von Horthy as "Protector of the Magyar Republic," but despite the emphatic pronouncement of the Allies, the monarchical character of the constitution was reaffirmed on March 23. Hungary was a kingdom without a king. Such being the situation, the requests of her delegates for more moderate treatment met with scant consideration. The reply of the Council of Ambassadors on May 6 contained but slight alterations though it was asseverated that the League of Nations would be free to make such minor modifications of boundaries on ethnological or economic grounds as the future might reveal as feasible or desirable. The treaty was formally signed at Trianon on June 4. Hungary ratified the treaty on Nov. 13, 1920, and was admitted to the League of Nations in September, 1922.

The Treaty of Trianon duplicated the main features of the Austrian treaty except as regards territorial adjustments. By its terms, Hungary was transformed from a maritime, imperialistic country of 125,000 square miles into a landlocked fourth-rate power of some 35,000 square miles. On all sides, liberal cessions were to be made to neighboring states. The region of Slovakia on the southern slope of the Carpathian Mountains, though containing a large minority of Magyars, was incorporated in the new state of Czechoslovakia for economic and strategic, as

well as ethnic, reasons. To Rumania was assigned Transylvania with its compact Magyar minority in the East. A broad strip of Hungarian plain also was detached to secure Rumania's railroad communications with the Danube. Of the much contested Banat of Temesvar (q.v.), Yugoslavia received the county of Torontal in the west, the remainder going to Rumania. Yugoslavia also received Croatia-Slavonia, Bosnia, and Herzegovina. Fiume was renounced, to be disputed by Italy and Yugoslavia. Likewise to Czechoslovakia, almost purely for strategic reasons, was given the region called sub-Carpathian Ruthenia, autonomy being stipulated for the benefit of the 572,000 inhabitants. To Austria was renounced the region of Burgenland (see above).

Hungary was precluded from alienating her independence except with the consent of the League Council. Compulsory military service was abolished and her army was reduced to 35,000 men together with police to a number not exceeding 31,500. She was required to pay a reasonable sum of reparations before May 1, 1921, and such total sums in sixty semi-annual installments thereafter as might be decided upon by the Reparations Commission. All of her merchant shipping and up to 20 per cent of her river fleet were to be surrendered; an indefinite quantity of live stock was to be furnished for devastated countries; and Yugoslavia was to be supplied with annual allotments of coal for five years. Deprived of two-thirds of her territory and population, crippled economically and surrounded by more or less hostile states, Hungary yet constituted a potent menace to the future peace of the Balkans. Three million Magyars, now aliens in adjacent countries, created a new irredentist problem so dangerous that in 1920 the Succession States of Czechoslovakia, Yugoslavia, and Rumania formed the so-called "Little Entente" to meet it—an alliance calling for the indefinite maintenance of standing armies to guard against the restoration of the Hapsburgs or a Hungarian war of revenge. See **LITTLE ENTENTE**.

CONTINUATION CONFERENCES

The Paris Peace Conference, as we have seen, adjourned on Jan. 21, 1920, before the Hungarians had decided to accept their treaty and before the Adriatic question including the problem of Fiume and the disposition of Dalmatia, Albania, and Thrace had been settled. Even more important, no agreements had been reached upon three outstanding and vital issues, viz., the terms of the treaty with Turkey, the question of future relations with Soviet Russia and the fringe of states on her western border, and the enforcement of the treaties already signed or projected, especially the Treaty of Versailles with Germany, the task of executing which embraced a whole range of subjects such as reparations, disarmament, punishment of war-criminals, plebiscites, etc. These three major problems to say nothing of a host of subsidiary and secondary issues engaged the attention of the world continuously after 1919 and necessitated a protracted series of difficult and delicate negotiations during which the appearance of Allied unity which had been so precariously maintained hitherto was even more seriously undermined.

On Jan. 16, 1920, pursuant to the call of President Wilson, the first session of the League of Nations Council convened in Paris,

but though inextricably interwoven with the terms of the peace treaties and specially devised as a convenient and indispensable instrument of international cooperation and adjustment, the League was destined to play a relatively insignificant rôle in the controversies growing out of the territorial and economic settlement. (See **LEAGUE OF NATIONS**.) Rather, the work of carrying on diplomatic arrangements at the termination of the Peace Conference devolved upon the two agencies already mentioned—the Council of Ambassadors and the Council of Allied Premiers and Foreign Ministers. These councils held a rapid succession of formal and informal conferences during the ensuing years, now dealing with Russia, now with the execution of the German Treaty, then again with Turkey, Fiume, or Upper Silesia. It was impossible to confine attention to any one problem until it was solved. Others simultaneously pressed for adjustment and the divergence of national interests led inevitably to the use of the traditional and time-honored diplomatic methods of *quid pro quo*, compromise and compensation, interjected with accusations, threats, economic retaliation, ultimatums, and armed clashes. The liquidation of two of these problems, i.e., the Turkish peace and the enforcement of the treaties, is discussed below. Under Russia will be found an account of the handling of the Russian problem.

THE SETTLEMENT WITH TURKEY

The Turkish Secret Treaties. Of all the spoils of the World War, the Ottoman Empire was among the richest. A long series of secret agreements were negotiated among the Allied Powers from 1915 to 1919 concerning the future political control and economic exploitation of Turkey. In March, 1915, Russia was assured of the annexation of the Straits and of Constantinople in return for assent to the assignment of the neutral zone of Persia to Great Britain and concessions to British interests in Mesopotamia and Egypt. On Apr. 26, 1915, by the Treaty of London, Italy was promised, among other things, a share in the Turkish Empire equal to that of Great Britain, France, and Russia, and including the port of Adalia and its hinterland. A more specific delimitation of interests took place in 1916. On April 26, one year after the Treaty of London, France and Russia signed the secret Sazonov-Paléologue Treaty dealing with their respective interests in northern Asiatic Turkey. Russia was awarded a vast domain of 60,000 square miles between the Persian frontier and the Black Sea, with immense deposits of silver, salt, and copper. The French were assigned a large slice of territory reaching south and west to the Mediterranean, the exact boundaries to be arranged with the British. Two weeks later on May 9, the famous Sykes-Picot Treaty prospectively partitioned the southern part of Asiatic Turkey, allotting Syria, Cilicia, and Southern Armenia to France in full sovereignty and establishing a French sphere of influence over the extensive and valuable provinces of Aleppo, Damascus, Deir, and Mosul. Great Britain was given complete control over the Mediterranean ports of Acre and Haifa and the region of lower Mesopotamia stretching from Bagdad to the Persian Gulf. Italy was excluded from these pacts, but learning of them in roundabout ways manifested such grave discontent that on Apr. 17, 1917, a

new secret agreement, that of St. Jean de Maurienne, was signed. As subsequently modified in August, 1917, it provided that Italy was to get almost complete possession of the southern half of Anatolia, including the cities of Adalia, Konia, and Smyrna, together with an extensive sphere of influence in the region northeast of Smyrna inhabited chiefly by Greeks and Turks.

Curiously enough, it was at this same time that the United States entered the War and that Allied statesmen were issuing fresh declarations of unselfish war aims. To be sure, the Russian Revolution and subsequent socialistic renunciation of all imperialistic ambitions combined with growing labor unrest to complicate the situation. In his address of Jan. 5, 1918, Mr. Lloyd George, speaking for the British government, disclaimed any intention of depriving Turkey of its capital, "or of the rich and renowned lands of Asia Minor and Thrace . . . predominantly Turkish in race," but did advocate a recognition of the separate national conditions of Arabia, Armenia, Mesopotamia, Syria, and Palestine. Three days later, Mr. Wilson in his Fourteen Points speech stated that the Turkish portion of the Ottoman Empire "should be assured a secure sovereignty," but that submerged nationalities should be accorded "unmolested opportunity of autonomous development" and the Dardanelles should be permanently neutralized under international guarantees. This very definite pledge formed a part of the pre-armistice agreement which both Germany and the Principal Powers agreed to be morally binding for the Peace Settlement. Secret negotiations, however, continued to vitiate professed idealism. Lloyd George's speech in addition to reassuring British labor, mollifying Indian Moslems, and supporting Wilsonian internationalism served the ulterior but no less effective purpose of intimidating the French in secret dealings with regard to Turkey. In December, 1918, Clémenceau having visited London to secure confirmation of the Sykes-Picot arrangement of 1916, Lloyd George demanded the transfer of the valuable oil region of Mosul from the projected French sphere of influence to British control and also permission to determine the future of Palestine. Secret conversations continued unknown to "allied" Italians and "associated" Americans, and on February 15, a month after the Peace Conference began, the French were eventually obliged to accept the British proposal. On Mar. 20, 1919, just on the eve of the great French crisis described above, the finely spun network of secret treaties seriously entangled the Big Four in its meshes, when, in secret session of that supreme conclave, Lloyd George pressed for the dismemberment of Turkey. A heated controversy ensued between the British and the French. Wilson refused to acknowledge the validity of the secret engagements and proposed a settlement on the basis of his Twelfth Point. The matter was eventually compromised by the application of the mandate principle to transferred territories.

Other disputes arose continually. Early in February, 1919, the Italian claim to the Smyrna area having lapsed owing to the failure of Russia to sanction the St. Jean de Maurienne arrangement, the Greeks put in a claim to that region and also disputed Italian occupation of the Dodecanese. Italy sent expeditions to Smyrna and otherwise showed a disposition to anticipate decisions by the Conference; but when the

Italians were absent from Paris in late April and early May, 1919, during the Fiume impasse, Venizelos pressed his claim and on May 6, unknown to the Italians, secured the secret authorization of the Big Three to occupy Smyrna. This move, being duly executed in the space of a fortnight, further embittered the Italians, and contributed to arousing Turkish nationalism with the dire consequences noted below. Lloyd George advanced numerous sordid schemes for solving the Fiume situation by granting Italy concessions in Asia Minor and Africa, but they all fell through.

The collapse of Russia caused a long and acrimonious discussion of the future disposition of Constantinople and the Straits. France, Great Britain, and Italy being seriously distrustful of one another, the United States was offered a mandate as early as February, 1919. Wilson favored the idea, but refused to pledge the American people. The subsequent course of events in America led to the abandonment of the project, caused great fluctuations in Allied policy and indefinitely delayed the signing of the Turkish Treaty. In November and December, 1919, while the Supreme Council was yet functioning, the Turkish settlement was discussed by representatives of Italy, France, and Great Britain in special conferences, and on Feb. 16, 1920, at a conference held in London, it was finally announced that Constantinople would be left under Turkish suzerainty. The work of drafting the treaty was then pushed.

The San Remo Conference. On April 24, at the Conference of San Remo, the main outlines of the settlement were completed. Mandates for Syria, Cilicia, and Lebanon were promised to France; for Adalia and Rhodes to Italy, for Palestine and Mesopotamia (including Mosul) to Great Britain; and for Armenia offered first to the League of Nations and later to the United States, both refusing to accept. Simultaneously, the French and British delegates at San Remo signed a secret agreement providing for an equal division of interests and exploitation in Rumania for the transfer of the formerly German-owned quarter-interest in Mesopotamian oil, together with a quarter-interest in Anglo-Persian oil piped to the Mediterranean through territory under French mandate, in return for the provision by France of pipe lines and branch railways for the movement of their oil. The terms of this agreement gradually transpired despite denials by the signatories, and on November 20, Secretary of State Colby (successor of Mr. Lansing) lodged a vigorous protest refusing to recognize the establishment of these oil monopolies in Mesopotamia and elsewhere. This merely stimulated the British to negotiate a new secret convention with France on Dec. 23, 1920, confirming the previous agreement. On May 11, the preliminary draft was handed to the Turkish delegates at Sévres, France. Its terms produced great excitement among the Nationalists in Turkey, who, under the leadership of Mustapha Kemal Pasha, evinced a determination to defy the Allies and work for the regeneration of their country's fallen prestige and power. See **TURKEY**.

Boulogne and Spa Conferences. During May and June, the Nationalists, in control of Asiatic Turkey, drove the French to the coast of Cilicia and then threatened the Straits zone. So menacing did the situation become that on June 21, the Conference of Boulogne at which

were represented France, Great Britain, Italy, Japan, Belgium, and Greece, authorized the Greeks to undertake military operations against the Nationalists. At the Conference of Spa, Turkish requests for modifications in the peace conditions were rejected and an ultimatum was issued to coerce the Sultan's government, whose authority, due to the Nationalist revolt, now scarcely extended beyond the confines of Constantinople, where it was both bolstered up and seriously limited by Allied occupation. On Aug. 10, 1920, the Treaty was signed at Sèvres, simultaneously with the signature of a secret tripartite agreement among Great Britain, France, and Italy and also of a special convention between Italy and Greece. Representatives of the United States and of Hedjaz were not present, and the Yugoslav delegates refused to sign.

Treaty of Sèvres. By the terms of this Sèvres Settlement of Aug. 10, 1920, the century-long devolution and dismemberment of the Ottoman Empire was virtually consummated. Territorially, it was reduced from its 1914 area of 710,000 square miles to a small Turkish national state confined mainly to the interior of Asia Minor and embracing an area of less than 100,000 square miles. The Arab State of the Hedjaz was emancipated from Turkish sovereignty though subjected to British control. Armenia became a free Christian Republic, her boundary with Turkey to be arbitrated by President Wilson. Palestine, including Transjordan, under a League of Nations mandate held by Great Britain, was to afford a national homeland for the Jews. Syria, with Cilicia, was likewise detached from Turkey and made a mandate of France. Southern Anatolia, including the port of Adalia, was constituted as an Italian "sphere of influence," being a sorry remnant of the princely domain marked out for Italy by the St. Jean de Maurienne agreement. Smyrna and its hinterland were transferred to Greece together with Thrace, Adrianople, the peninsula of Gallipoli, and the islands of Tenedos and Imbros.

By special arrangement with Italy, the Dodecanese Islands in the Aegean, which had been occupied by Italy since the end of the Tripolitan War in 1912, were to be yielded to Greece with the exception of Costellorizo and Rhodes, whose status was to be determined by plebiscites. In the case of the latter, the plebiscite was to be held only in case Great Britain, whose sovereignty over Cyprus was recognized by Turkey, ceded that island to Greece. The French protectorates over Tunisia and Morocco were validated, as were also those exercised by Great Britain over Egypt and the Sudan. The coasts of the Dardanelles, the Sea of Marmora, and the Bosphorus were erected into a neutralized "zone of the straits" controlled by a League of Nations commission consisting of British, French, Italian, Japanese, Rumanian, Greek, and Turkish members. The capitulations which the Sultan had abrogated in 1914 were revived and amplified; Turkey was made responsible for the costs of the Allied military occupation, and her own army was to be reduced to a maximum size of 50,000 men. A Financial Commission was instituted to supervise taxation, customs, loans, and currency, to control the Turkish budget, and ratify or reject proposed economic concessions, and all of this was to be done, in the language of the tripartite agreement, "to help Turkey, to develop her resources,

and to avoid the international rivalries which have obstructed these objects in the past."

Rejection of the Sèvres Treaty. Despite the acceptance of the Treaty of Sèvres by the Sultan's government at Constantinople, the divergent interests of the Great Powers created a serious lack of unity on the Near Eastern question which proved fatal when the Turkish National Assembly at Angora refused to ratify such an unjust convention. By October, 1920, through a series of successful military campaigns (see **TURKEY**), Mustapha Kemal Pasha obliterated the Armenian Republic, rendered the French position in Cilicia untenable, forced the British Army of occupation back into the Ismad peninsula, and compelled the Italians to withdraw their troops to Adalia. Menaced by an Arab rebellion in Syria, unable to protect Cilicia against the Nationalists, unwilling to increase the size of their Syrian military establishment which already numbered 100,000 men, dissatisfied with the distribution of spoils in the Near East, fearful of the augmenting power and prestige of British imperialism, the French decided to scrap the Treaty of Sèvres and come to terms with the Angora government of Mustapha Kemal Pasha. Having broached the project to the noncommittal Lloyd George at the London Conference of February-March, 1921, they negotiated directly with the Angora delegation and on March 9, there was signed at London a Franco-Turkish agreement terminating hostilities in Cilicia. The Nationalists recognized the special social and cultural interests of France in Turkey, confirmed French interests in the Bagdad Railway and promised favorable concessions to French capitalists in Cilicia and southern Armenia. France on her part was to evacuate Cilicia, readjust the Turco-Syrian boundary, and adopt a more benevolent attitude toward the Grand National Assembly. See **CILICIA**.

The Italian situation in Turkey also was very menacing, for Italian troops had been driven out of Konia and maintained but an increasingly precarious position at Adalia. The Treaty of Sèvres was distinctly unpopular in Italy for it had registered a subversion of Italian prospects in Asia Minor to the advantage of the hated Greeks. Accordingly, on March 13, a Turco-Italian agreement was signed at London providing for the withdrawal of Italian troops from Ottoman soil and for economic collaboration between Italy and Turkey in the Adalian hinterland, together with the granting of certain valuable concessions to Italian capitalists. The Italian government also pledged itself to support effectively Turkish demands for untrammelled sovereignty and the restitution of Thrace and Smyrna. Then valiant resistance having elicited a sympathetic response from Bolshevik Russia, on May 16, 1921, the Turkish Nationalists achieved another diplomatic triumph when a treaty was signed at Moscow with the Russian Socialist Federated Soviet Republic. Russia refused to recognize the validity of the Treaty of Sèvres, disavowed all imperialist ambitions in Turkey, ceded outright the Caucasian territories of Kars and Ardahan, and declared the capitulatory régime null and void as being incompatible with Turkey's autonomous national development.

Further negotiations conducted between France and Turkey during the summer of 1921, for the purpose of confirming and elaborating their March agreement, culminated in the signing of

the Treaty of Angora, on October 20. The British were outraged at what they termed this breach of good faith and stimulated the Greeks to renewed efforts against Turkey. The Franco-British Entente Cordiale was strained to the breaking point, not alone by antithetical policies in the Near East, but by acute differences simultaneously manifested over relations with Russia, naval disarmament, and German reparations. During the protracted and sanguine war between Greece and the Turkish Nationalists in Asia Minor during 1921-1922, the British supported the Greeks as convenient tools for the advancement of their own interests, but the French and Italians aided and abetted the Turks even to the extent of withdrawing their troops from Constantinople. The decisive victories of Mustapha Kemal Pasha during the late summer and autumn of 1922 swept the Greeks out of Smyrna. An armistice between the Turks and the Allies was signed at Mudania, Oct 10, 1922, permitting the former to retain Smyrna, take over the administration of Constantinople, and reoccupy Eastern Thrace, pending the formulation of a new peace treaty, to replace the thoroughly discarded Treaty of Sévres.

Lausanne Conference. A conference of the Turks and the European Powers was convened at Lausanne, Switzerland, on Nov. 20, 1922, and was in session for eleven weeks, when it broke down, on Feb. 4, 1923, owing to the peremptory refusal of the Turkish delegation to accept a treaty drafted by the Allied leaders. All hopes of destroying Turkish power by fostering Greek imperialism in Asia Minor had been dissipated, but Great Britain was determined to maintain control of Mesopotamia (particularly Mosul) and to secure continued neutralization of the Straits. The French, supporting the Turks on these territorial questions, nevertheless aroused their suspicion and opposition by insisting on the maintenance of the Capitulations and the confirmation of all Allied concessions in Turkey. French prestige received a substantial setback with the granting (April 10) to American interests of the Chester concessions which authorized railroad construction and industrial developments throughout Eastern Asia Minor. The breach between France and Turkey grew wider with the lapse of time and when at Turkish suggestion and with Allied acquiescence the Conference of Lausanne was resumed on April 22, the French steadily lost ground, but, their power being almost wholly absorbed in the contemporaneous occupation of the Ruhr, they were unable to coerce the Turks into any measurable recognition of their claims. On May 15, it was disclosed that a syndicate of British interests had purchased a controlling interest in the Bagdad Railway.

The Lausanne Treaty. On July 24, 1923, the treaty was finally signed at Lausanne by representatives of Great Britain, France, Italy, Japan, Greece, Rumania, and Turkey which constituted a drastic revision of the whole Near Eastern Settlement as registered in the Treaty of Sévres. Yugoslavia alone refused to sign because of dissatisfaction with the Ottoman debt settlement. Turkey definitely resigned all claims to Hedjaz, Palestine, Transjordan, Mesopotamia, and Syria, but she retained all of Anatolia, Turkish Armenia, Cilicia, Adalia, Smyrna, Constantinople, Gallipoli, Adrianople and Eastern Thrace to the Maritza River. Along the new European frontier, a neutral or

demilitarized zone 60 kilometers wide was created, to prevent border conflicts. Likewise, but for a different purpose, the Gallipoli peninsula and the shores of the Straits were demilitarized and the Straits themselves were placed under an international commission supervised by the League of Nations. The "freedom of the Straits," for which the British Foreign Minister, Lord Curzon, had so valorously battled, was assured by a separate convention, bearing all the earmarks of compromise, by which merchant and war vessels, the latter in restricted number, were permitted liberty of passage in peace and war, except in case Turkey should be one of the belligerent powers. Disposition of the coveted oil fields of Mosul, in dispute between Britain and Turkey, was to be decided by diplomatic agreement, or, that failing, by reference to the League. Not only were the fettering restrictions which the Allies had attempted to place on Turkish finance, Army, and Navy, struck off, but reparation claims were canceled and the Allies recognized the abolition of the Capitulations, stipulating merely that Turkey should appoint for a transitional period of five years four legal counselors, from neutral states, to observe the working of the Turkish courts. The Nationalists, in short, won a remarkable diplomatic victory in their single-handed diplomatic combat with the powers of Europe. The erstwhile aggressive Greeks were thoroughly humiliated. Not only were they compelled to surrender Smyrna, Gallipoli, and Eastern Thrace to Turkey, but also to resign again to Italy the Greek-speaking Dodecanese islands in the Aegean. Some 600,000 Greek nationals were to be deported from Turkish territory in exchange for Turkish nationals.

ENFORCEMENT OF THE VERSAILLES TREATY

Some portions of the Treaty of Versailles, such as the guarantees of its execution prescribed in part 14, were merely recognitions of *faits accomplis*, and others were speedily put into operation. The League of Nations and the International Labor Organization authorized by parts 1 and 13, respectively, were early established—the first International Labor Conference being held in 1919 and the first session of the League of Nations being convened in 1920. Part 7, relating to penalties, proved practically impossible of execution. On the ground that no existing international court possessed legal jurisdiction, the Dutch government refused to comply with reiterated Allied demands for the extradition and trial of the former German Emperor, and in March, 1920, the "solemn farce" was terminated by an understanding that William II would be indefinitely interned in Holland and prevented from participating in any further international mischief. A similar demand made upon Germany in February, 1920, for the extradition of some 882 war criminals, including civilians and military and naval officers of high rank, was finally abandoned in favor of a German proposal that the accused be tried by a German Federal Court at Leipzig. The Inter-Allied Justice Commission promptly transmitted to Berlin the names of some 46 offenders against whom the evidence was most conclusive, the Allies reserving the right to hold retrials should they consider the verdicts palpably unjust. The Germans were very dilatory about proceeding to try these men and though the matter was discussed at the Spa

Conference (July 5-16, 1920), it was not until after the Allied ultimatum of Apr. 30, 1921, demanding action on this point among others, that trials began at Leipzig. A few convictions resulted, but the whole proceeding was rather farcical.

Territorial cessions and boundary readjustments prescribed under parts 2, 3, and 4 were effected, as far as Germany was concerned, without great difficulty except in the case of Upper Silesia. The economic sections of the treaty relating to ports, waterways, and railroads, etc., occasioned some difficulty, but the really great conflicts took place over German disarmament, involving the all-important issue of French security, and over reparations, involving a whole complex of issues, such as time and methods of payment, inter-Allied allocation of the proceeds, inter-Allied cancellation of debts, the restoration of northern France, Belgium etc., the economic rehabilitation of Europe, French security, extension of Allied occupation of German territories (e.g., seizure of the Ruhr), and the maintenance or disruption of Allied solidarity. See REPARATIONS.

The treaties of 1919-1920, as we have seen, provided for the unilateral application of the principal of disarmament with the avowed purpose of attaining that long-sought objective—the destruction of German militarism. Throughout 1920, the Allies had to insist on reduction of the German Army to the 100,000 limit imposed by the treaty. At the Spa Conference (April 18-25), Premier Millerand, yielding to an Italian demand for trade negotiations with Russia, and to Lloyd George's Near Eastern importunities, secured as the price of his consent on these two points, a joint demand upon Germany for immediate disarmament, a refusal of a German request for a permanent army of 200,000 men, and a severe warning against future infractions of the treaty. At the Spa Conference (July 5-16), German disarmament was the first question considered. After a heated discussion, Germany, in return for her promise to disband immediately certain auxiliary forces such as the *Sicherheitspolizei* and *Einwohnerwehr*, was finally granted (July 9) permission to postpone until Jan. 1, 1921, the reduction of her army to the prescribed limit, though it was stipulated that it should not exceed 150,000 effectives after Oct. 1, 1920. As a guarantee of her faithful execution of these requirements, the Allies reserved the right to invade and occupy the Ruhr Valley or other regions.

After the Spa Conference, the question of German disarmament continued to be the subject of numerous notes exchanged between the Entente Powers and the German government. The Germans, however, failed to live up to their promises, and disarmament along with reparations again came to the fore at the Paris Conference Jan. 24-29, 1921, at which time they were given until July 1 to comply with the Spa agreement. Persistent dilatoriness on this point together with nonpayment of reparations and postponement of war-crime trials, led to the issuance of an ultimatum (May 7, 1921) by the London Conference threatening invasion of the Ruhr should not the Germans without reservations comply with treaty requirements by May 12. On May 10, the Reichstag voted to submit. Thereafter better progress was made. The work of disarmament continued under the super-

vision of the inter-Allied military control commission. French security constituted an important subject of discussion at the Cannes Conference, January, 1922. As the best method of adequately protecting France against attack and of fostering peace in Europe, Lloyd George, voicing English opinion, advocated a tripartite agreement embracing England, France, and Germany. Premier Briand vehemently opposed this plan and demanded an Anglo-French military alliance. After considerable parley, a 10-year treaty was signed (but never ratified) by which both powers reaffirmed their common interest in those provisions of the Versailles Treaty relative to German fortifications and military activities along the Rhine; both powers undertook also to act in concert should Germany take any measures incompatible with the treaty, and Great Britain specifically promised to place her naval, military, and aerial forces at the disposal of France in the event of direct and unprovoked aggression by Germany. Bitter opposition in the French Chamber of Deputies to Premier Briand's promises to moderate his attitude toward Germany led to his supersession by the nationalistic Poincaré. This change in the French government put an end temporarily to the chance of recentring Entente solidarity and foreshadowed the military occupation of the Ruhr. At the Genoa Conference Apr. 10-May 15, 1922, Lloyd George proposed a 10-year European nonaggression compact, but the French refused to accept this plan unless every other European nation agreed to sign, unless Russia recognized all her existing boundaries during the 10-year period, and unless France forfeited none of her rights for enforcement of the Versailles Treaty. During 1920-1921, France and Great Britain had drifted apart due to divergence of interests and policies, as regards German reparations, Poland and relations with Russia, and Turkey and the Near Eastern settlement. In January, 1923, the Franco-Belgian seizure of the Ruhr further undermined their relations, and the *entente cordiale* of 1904 had been definitely transformed into suspicion and dislike, exacerbated not only by the above-mentioned differences on questions of policy but also by a keen rivalry in aeronautical expansion. France, meanwhile, in an endeavor to stabilize the treaties of which she had been the most active and powerful defender, had forged a network of alliances with other European states. In July, 1920, a defensive alliance was concluded with Belgium; in February, 1921, with Poland; and in 1924, with Czechoslovakia and Rumania. France, therefore, became the leading spirit in a system of European alliances maintaining standing armies aggregating nearly 2,000,000 men, and consecrated to the preservation of the newly made peace treaties by force if necessary.

Bibliography. In addition to the works mentioned in the articles, the following works will be found of service in this field: Morav, *History of European Diplomacy 1914-1924*; Winston Churchill, *The World Crisis 1916-1918*; Baker, *Woodrow Wilson and World Settlement* (3 vols., 1922); Baker, and Dodd, editors, *The Public Papers of Woodrow Wilson* (6 vols., 1925-26); Seymour, editor, *The Intimate Papers of Colonel House* (4 vols., 1927-28).

Other phases of international post-war problems are discussed under the following heads: LEAGUE OF NATIONS; REPARATIONS; LABOR

ORGANIZATION, INTERNATIONAL; MANDATES; WASHINGTON CONFERENCE; RACIAL MINORITIES TREATIES. For national points of view, see the history sections under the articles UNITED STATES; GREAT BRITAIN; FRANCE; GERMANY; RUSSIA; TURKEY; AUSTRIA, HUNGARY; etc. Detailed treatment of the territorial and political disputes that arose out of the making of the Peace and its application will be found under the following: TYROL, GERMAN SOUTH; BURGENLAND; FIUME-ADRIATIC CONTROVERSY, KLAGENFURT; THRACE, BANAT; TRANSYLVANIA, Bessarabia; BUKOVINA, SILEZIA, UPPER; TESCHEN, ZIPS, AND ORAVA, DANZIG; ALLENSTEIN-MARIENWERDER; GALICIA, VILNA; MEMEL; LITTLE ENTENTE; SAAR BASIN, EUPEN, MALMEDY, AND MORENET; LIMBURG, SOUTHERN; LUXEMBURG; SCHLESWIG; RHINELAND; DODECANESE, SMYRNA; CILICIA; DARDANELLES AND BOSPORUS STRAITS; KURDISTAN; SHANTUNG. See the articles EUROPE and AFRICA for a general presentation of the territorial readjustments effected by the War in these two continents. PEACH BORER. See ENTOMOLOGY, ECONOMIC

PEARL, RAYMOND (1879-). An American biologist and statistician, born in Farmington, N. H., and educated at Dartmouth and the University of Michigan. He taught at the latter and the University of Pennsylvania until 1907, when he received the appointment of biologist and head of the department of the Maine Agricultural Experiment Station. He resigned this position in 1918 to become professor of biometry and vital statistics at the Johns Hopkins University School of Hygiene and Public Health. In 1923 he was appointed professor of biology in the Medical School and in 1925 director of the Johns Hopkins Institute for Biological Research. He also was made official statistician of the university and consultant in vital statistics and epidemiology to the United States Public Health Service. His published works comprise: *Modes of Research in Genetics* (1915); *The Nation's Food* (1920); *The Biology of Death* (1922); *Introduction to Medical Biometry and Statistics* (1923); *Studies in Human Biology* (1924); *The Biology of Population Growth* (1925); *Alcohol and Longevity* (1926); *To Begin With* (1927); *The Rate of Living* (1928). In collaboration with Mitchell, he wrote the *Reference Handbook of Food Statistics*. He is editor of the *Quarterly Review of Biology*.

PEARSE, ARTHUR SPERRY (1877-). An American zoologist, born at Crete, Nebr., and educated at the University of Nebraska and at Harvard. He was Austin teaching fellow at Harvard (1907-08); instructor in zoology (1909-10) and assistant professor (1910-11) at the University of Michigan; assistant professor of zoology at the University of the Philippines for three months in 1911; and associate professor (1912-19) and professor of zoology (1919-26) at the University of Wisconsin. After 1927 he was a member of the faculty, graduate department, Duke University, Durham, N. C. Professor Pearse published articles on animal behavior, fishes, and crustacea, as well as *General Zoology* (1917); *Animal Ecology* (1926).

PEARSON, ALFRED JOHN (1869-). An American diplomat. He was born at Landskrona, Sweden, brought to America in infancy, and graduated at Bethany College, Lindsborg, Kan.

(1893). Receiving the Ph.D. degree at Yale (1896), he taught at Upsala College, Brooklyn, N. Y., and was later appointed professor of German at Drake University, Des Moines, Iowa, in 1907. By appointment of the Governor of Iowa, he made a study of Germany's public schools in 1911. President Coolidge named him as Minister to Poland in 1924 and to Finland in the following year. He is the author of *Helps in the Study of English Classics* (1901), *The Rhine and Its Legends* (1919); and *The Moselle in History and Legend* (1919).

PEARSON, KARL (1857-). An English physicist and sociologist (see VOL. XVIII). His later works include *The Life and Letters of Francis Galton* (1915-1924) and *Tables for Statisticians* (1914-1924). He edited *Biometrika*, vols. i-xa (1902-28), and *Annals of Eugenics*, vols. i-iii (1925-28).

PEAR THRIPS. See ENTOMOLOGY, ECONOMIC

PEEL, RT. HON. WILLIAM ROBERT WELLESLEY, SECOND VISCOUNT (1807-). An English government official, educated at Harrow and Balliol College, Oxford. At first a journalist, he served as a Unionist member of Parliament (1900-06 and 1909-12), entering the House of Lords on the death of his father in the latter year. He sat on the London County Council for many years (1900-04, 1907-10, 1913-19), being its chairman in 1914, and was leader of the Municipal Reform Party (1908-10). He was chairman of the Committee on the Detention of Neutral Vessels (1916), Joint Secretary to the National Service Department (1917), Under-Secretary of State for War (1919-21), Chancellor of the Duchy of Lancaster and Minister of Transport (1921-22). From 1922 until the fall of the Conservative government in January, 1924, and from October, 1928, to June, 1929, he was Secretary of State for India. Between his two tenures of this Secretaryship, he was First Commissioner of Works. He became a Privy Councillor in 1920.

PEGRAM, GEORGE BRAXTON (1876-). An American physicist, born at Trinity, N. C., and educated at Trinity College, Durham, N. C., at Columbia University, and at Berlin and Cambridge. In 1900 he became assistant in physics at Columbia, and in 1918 full professor and dean of the faculty of applied science. He was a magnetic observer with the United States Coast and Geodetic Survey (1902-06). Dr. Pegram made original studies on the electromagnetic theory and on radioactivity.

PEGRAM, HENRY (1862-). A British sculptor, born in London and trained at the Royal Academy Schools. His principal works are "Death and the Prisoner", "Ignis Fatuus," bought for the Chantrey Bequest (1889), sculpture on the entrance to the Imperial Institute (1891-92); "The Last Song," gold medal, Dresden (1897); the great candelabra in St. Paul's Cathedral (1897); "A Sea Idyll" (1902); "Sihylla Fatidica," bought for the Chantrey Bequest (1904); "Chance" (1913), the sculpture for Oriel College; statue of Cecil Rhodes at Cape Town; monument to Edith Cavell erected at Norwich; the Cunard War Memorial, Liverpool; "Hylas" (1922); "Lux Mundi" (1926); and busts of Earl Jellicoe and Dean Inge (1928). He was made a member of the Royal Academy in 1922.

PEIPING. New name of Peking, former Capital of China. See CHINA, under *History*.

PEIXOTTO, ERNEST CLIFFORD (1869-). An American artist, born in San Francisco. He studied in Paris as a pupil of Benjamin Constant and Jules Lefebvre at the Académie Julien. He spent much of his time in Europe writing and illustrating for American periodicals and during the World War directed the American Expeditionary Forces' art-training centre at Bellevue, France, and was the official artist of the A. E. F. He was elected an associate of the National Academy of Design (America) in 1919 and Chevalier of the Legion of Honor (France) in 1921. He exhibited many pictures at the Paris Salon and in leading American galleries. He executed mural friezes, was director of mural painting at the Beaux-Arts Institute of Design, New York, 1919-26, and painted the murals in the Seamen's Bank for Savings, New York (1927). His later books include *By Italian Seas* (1906); *Through the French Provinces* (1910); *Pacific Shores from Panama* (1913); *Our Hispanic Southwest* (1916); *A Revolutionary Pilgrimage* (1917); *The American Front* (1919); *Through Spain and Portugal* (1922).

PELLAGRA. The theory of a deficient diet as responsible for this disease was partly exploded by the discovery that, in California and Louisiana, prosperous and well-nourished people were developing pellagra, but the opinion is general that the disease is due to absence from the diet of some unknown vitamin-like principle with other unknown contributory factors. Pellagra came into prominence in connection with the Mississippi Flood which called attention to the fact that in the inundated area it had long been prevalent. During the year 1924, the number of cases reported had reached 20,000 with a mortality of 1020 and the estimate for 1927, the year of the inundation, was up to 50,000 cases with 2500 deaths. This increase was anticipated because, under the economic pressure of the inundation, the people were forced more and more to subsist on a diet which experience has shown is well calculated to foster the development of new cases, to wit, meal, pork, and molasses. To offset this deficiency diet, and in the absence of proper dietetic articles, such as lean meat, poultry, fish, eggs, and milk, it has been believed that dried and killed yeast could readily be distributed among the candidates for the disease if these could be induced to make use of it; for this substance apparently contains an unknown vitamin which suffices to prevent the malady. The prevalence of pellagra in this area is held to be due to the fact that the people wish to raise only cotton and hence do not grow truck-farm products and also ignore dairy products and poultry, which forces them to depend on the few food staples sold in the stores. See FOOD AND NUTRITION.

PELLÉ, MAURICE (CÉSAR JOSEPH) (1863-1924). A French soldier and diplomat, born at Douai. In 1913-14 he was commander of the auxiliary Moroccan troops and chief of staff of the troops of occupation of Morocco. During the World War, he commanded the brigade of Moroccan sharpshooters, was major general of the French Armies, was commander of the 153d Division and the 5th Army Corps. In January, 1919, he was head of the French military mission to Czechoslovakia, then becoming chief of the French general staff, and later commander-in-chief of the Czechoslovakian Army (1919-20). In the latter year, he was appointed French

High-Commissioner in the Near East, where he endeavored to mediate peace between the Turks and the Greeks and the Turks and the Allies. He was a signer of the Treaty of Lausanne (1923), and received decorations from many European nations.

PELLEY, JOHN JEREMIAH (1878-). An American railway official. He was born at Anna, Ill., and after a high-school course and some special work at the University of Illinois, entered the operating department of the Illinois Central Railroad, working up to a superintendency and becoming general manager (1923-24) and vice president in charge of operation (1924-26). He was then made president of the Central of Georgia, the Illinois Central's chief subsidiary (1926-28). In 1929 he was called to the presidency of the New York, New Haven & Hartford Railroad.

PELLIOT, pēl'yō', PAUL (1878-). A French archaeologist and Orientalist, born in Paris. In 1899 he was made a member of the Archaeological Mission to French Indo-China. He was in Peking during the Boxer uprising and in 1905 was named by the Minister of Education to head an archaeological expedition (1906-09) to Central Asia and China, to investigate traces of pre-Islamic Buddhism in China. At Tun-chuk, in the Chinese Turkestan, Pelliot discovered the ruins of a Buddhist temple built in the Greco-Buddhist style, and from there he was directed to a monastery at Tuen Huang, where he made an amazing find of some 15,000 manuscripts and silk paintings. He returned with most of the manuscripts, as well as other objects of historical value, to Paris. The collection of Chinese manuscripts which he organized at the Bibliothèque Nationale was larger than any to be found in China proper. The manuscripts, all of which date before the eleventh century, are in Chinese, Tibetan, and Sanskrit. The French government rewarded Pelliot for his expedition by creating for him at the Collège de France a chair on the languages, history, and archaeology of Central Asia (1911). In 1921 he was elected to the Academy of Inscriptions of the Institute. A catalogue and description of the findings of his expedition was published under the title, *La Mission Pelliot en Asie Centrale*, 5 vols. (1914-21). He also wrote *Un traité manichéen retrouvé en Chine*, translated and annotated with E. Chavannes (1912); *À propos du Keng Tchc T'ou* (1913); *Les grottes de Touen-Houang* (8 vols. 1914-24); *Le Sâtra des causes et des effets du bien et du mal*, edited and translated with R. Gauthiot (1920); and *Jades archaïques de Chine appartenant à M. C. T. Loo* (1925).

PENANG. See STRAITS SETTLEMENTS

PENNELL, JOSEPH (1860-1926). An American etcher, illustrator, and author (see Vol. XVIII). His later publications include *Pictures of War Work in America* (1918) and *Etchers and Etching* (1919). With his wife, he edited *The Whistler Journal* (1921). (*The Art of Whistler*, by Elizabeth Robins Pennell with Joseph Pennell, was published in 1928). He was chairman of the jury of the International Exhibition at Leipzig in 1914 and also at the Panama-Pacific Exposition in 1915, where he was awarded a commemorative medal. He won the Grand Prix in Florence in 1915 and was elected to the American Academy of Arts and Letters in 1922. In his later years, he conducted a wide and influential propaganda for

better education in the graphic arts in the United States. See *Joseph Pennell: an Account by his Wife* (Metropolitan Museum of Art, 1926).

PENNINGTON, MARY ENGLE (1872-). An American chemist, born at Nashville, Tenn., and educated at the University of Pennsylvania and Yale. In 1898 she became director of the chemical laboratory of the Women's Medical College of Pennsylvania, meanwhile serving as chief of the Philadelphia Chemical Laboratory. These positions she resigned in order to accept the office of chief of the food research laboratory of the Bureau of Chemistry in Washington (1908), which she held until 1919, when she became manager of the research and development division of the American Balsa Company of New York (1919-23). Her original investigations pertained to the chemical, bacteriological, and histological study of flesh foods, as well as of milk, on which she published her results in the publications of the American Chemical Society, the Society of Biological Chemists, and other scientific organizations.

PENNSYLVANIA. The thirty-second State in size (45,126 square miles) and the second in population; capital, Harrisburg. The population increased from 7,665,111 in 1910 to 8,720,017 in 1920, a gain of 13.8 per cent, estimated population, 1928, 9,854,000. The white population increased from 7,467,713 (1910) to 8,432,726 (1920); Negro, from 193,919 to 284,568; native white, from 6,028,994 to 7,044,876. Foreign-born whites decreased in number from 1,438,719 to 1,387,850. Both urban and rural populations increased, the former from 4,630,669 to 5,007,815, the latter from 3,034,442 to 3,112,202. The growth of the principal cities was as follows: Philadelphia, from 1,549,008 in 1910 to 1,823,779 in 1920; Pittsburgh, 533,905 to 588,343; Scranton, 120,867 to 137,783; Reading, 96,071 to 107,784; Erie, 66,525 to 93,372. See articles on these cities.

Agriculture. Pennsylvania is one of the greatest of the Eastern States agriculturally, but in common with nearly all the group, it has experienced a general decline in agriculture. The total acreage in farms, 18,586,832 in 1910, fell to 17,657,513 in 1920, or by 5 per cent, and farther to 16,296,468 in 1925. The number of farms decreased from 219,295 (1910) to 202,250 (1920) and 200,443 (1925). The improved land in farms totaled 11,847,719 in 1920. The percentage of total land area used for agricultural purposes decreased from 64.8 in 1910 to 61.5 in 1920, and 56.8 in 1925. The total value of all farm property rose from \$1,253,274,862 in 1910 to \$1,729,353,034, in 1920, or by 38 per cent, but diminished to \$1,460,702,270 in 1925; the average value per farm was \$5715 in 1910, \$8551 in 1920, and \$7287 in 1925. In interpreting these values, the inflation of the currency incident to the War is to be taken into consideration. Of the total number of farms in 1925, 163,695 were operated by owners; 1791, by managers; and 34,957, by tenants. The comparative figures for 1910 were 164,229; 3961; and 51,105. White farmers in 1920 numbered 201,799, of whom 187,277 were native and 14,522, foreign born. The Negro farmers numbered 451. Farms reported as under mortgage numbered 48,498 in 1920; 38,787 in 1925. The total number of dairy cows was 1,049,763 in 1920; 859,711 in 1925. "Beef" cows numbered 57,440 in 1920; 43,561 in 1925; sheep, 508,711

in 1920; 415,085 in 1925. There were 1,190,951 swine in 1920; 734,465 in 1925. The estimated production of the principal farm crops in 1928 was as follows: Corn, 50,037,000 bushels; wheat, 17,171,000; oats, 34,678,000; rye, 1,596,000; potatoes, 31,980,000; buckwheat, 3,802,000; tobacco, 49,580,000 pounds; and hay, 4,667,000 tons. Comparative figures for 1913 are corn, 57,057,000 bushels; wheat, 21,862,000; oats, 35,774,000; rye, 4,900,000; potatoes, 23,320,000; hay, 4,146,000 tons; and tobacco, 46,680,000 pounds. The apple crop in 1928 was 8,460,000, peach crop, 1,867,000, bushels.

Manufactures. Pennsylvania, ranking second among the States in agricultural importance, is surpassed only by New York. There were 77 cities having more than 10,000 inhabitants in 1920, which formed 50.8 per cent of the total population of the State and which reported 63.7 per cent of the State's manufactured products in 1919. There were 27,563 manufacturing establishments in the State in 1909; 27,973 in 1919; 17,298 in 1925; and 17,314 in 1927. Wage earners in manufactories numbered 1,135,837 in 1919; 999,460 in 1925, and 987,414 in 1927. Capital invested amounted to \$2,749,005,975 in 1909 and \$6,177,720,968 in 1919. The value of products was \$2,626,742,034 in 1909; it rose to \$7,315,702,867 in 1919, falling to \$6,901,762,098 in 1925, and to \$6,715,563,455 in 1927. The large increase in the value of products evidenced in 1919 was due partly to changes in economic conditions brought about by the War and cannot be properly used to measure the normal growth of manufactures during the war period. Steel works and rolling mills, chief in point of value of product, had an output valued at \$500,344,000 in 1909; at \$1,296,412,000 in 1919; at \$1,362,462,079 in 1925; at \$1,012,297,366 in 1927.

Foundry and machine-shop products, an extensive group of manufactures, amounted to \$210,746,000 in 1909; to \$233,616,000 in 1914; to \$624,415,000 in 1919; and to \$303,116,526 in 1927. Iron and steel blast-furnace production attained \$168,578,000 in 1909; \$135,806,000 in 1914; \$311,080,000 in 1919; and \$244,501,253 in 1927. The shipbuilding and boatbuilding output in 1919 was \$237,325,000, but later declined greatly, amounting to \$19,537,964 in 1927. The extraordinary increase in the output of the shipbuilding industry from 1914 to 1919 was due to the War. Silk manufactures totaled \$329,121,498 in 1925 and \$306,524,028 in 1927. The most important manufacturing cities of the State are Philadelphia, Pittsburgh, and Reading. In Philadelphia, there were 8375 manufacturing establishments with a product valued at \$743,720,000 in 1909; 9064, with \$1,996,481 in 1919; products in 1925 reached \$1,937,415,000. In Pittsburgh, there were 1658 establishments with \$243,392,000 in 1909; 1875, with \$614,727,000 in 1919; the 1925 products attained \$518,964,000. Similar figures for Reading are 482, with \$51,135,000 in 1909; 527, with \$141,561,000 in 1919, products reached \$132,405,000 in 1925. Other manufacturing cities are Allentown, Altoona, Bethlehem, Erie, Scranton, and Wilkes-Barre.

Mining. Pennsylvania, in point of value of products, is the most important of the mineral-producing States. In the order of their importance, these products are coal, cement, clay products, and natural gas. Petroleum, of which the State was the original and for many years the chief producer, lost importance through the

gradual exhaustion of the wells and the discovery of large areas of petroleum land in other States. Pennsylvania is the only State which produces the commercial domestic anthracite. At the same time, this State leads in soft-coal output. The progress of the coal-mining industry subsequent to 1914 is indicated by the following production figures (1914) bituminous, 147,983,294 net tons valued at \$159,006,296; anthracite, 90,821,507 net tons valued at \$188,181,399; (1915) bituminous, 157,955,137, \$167,419,705; anthracite, 88,995,061, \$184,653,498; (1916) bituminous, 170,295,424, \$221,685,175; anthracite, 87,578,493, \$202,009,561; (1917) bituminous, 172,448,142, \$421,268,808; anthracite, 99,611,811, \$283,650,723. (1918) bituminous, 178,550,741 \$463,159,736; anthracite, 98,826,084, \$336,480,347, (1920) bituminous, 170,607,847, \$642,630,000; anthracite, 89,598,249, \$434,252,198; (1921) bituminous, 116,013,942, \$322,538,300; anthracite, 90,473,451, \$452,304,903; (1926) bituminous 153,041,638 net tons, \$325,618,000, anthracite 84,437,452, \$474,164,252. In 1928 the total production of anthracite was 75,348,069 tons, valued at \$393,638,000, and of bituminous, 131,202,163 tons, valued at \$249,895,000. The greatly increased value of bituminous coal about 1920 was due partly to conditions arising from the coal-miners' strikes and partly to the inflation of the currency. In shipments of Portland cement, Pennsylvania ranks first among the States, with 25,985,106 barrels valued at \$20,944,787 in 1914, 28,748,546 barrels, \$27,915,298 in 1916; 22,238,689 barrels, \$33,600,956 in 1918, 27,662,116 barrels, \$52,632,082 in 1920, 41,395,604 barrels, \$70,437,218 in 1926. The production of petroleum during this period averaged about 8,000,000 barrels per year. In 1914 it was 8,170,335 barrels; 1918, 7,407,812, 1920, 7,438,000, 1922, 7,425,000, 1926, 8,961,000. In addition to the minerals noted above, the State produces large quantities of clay products, natural gas and natural-gas gasoline, sand and gravel, and stone. The total value of the mineral products in 1927 was \$936,693,474, compared with \$1,314,322,585 in 1920, \$918,048,917 in 1919; \$979,245,098 in 1918, and \$452,824,034 in 1914.

Education. In many respects, the laws under which the school system was administered remained until recent years unsatisfactory. To remedy this condition, the Legislature of 1921 provided for the raising of the standard qualifications of teachers, established higher salaries; added to the support of the normal schools; increased the length of the school term, especially in fourth-class districts; reinforced compulsory school attendance; established State aid to local communities for the maintenance of new and higher standards; established a budget system in every school district, encouraged the consolidation of rural schools; and centralized and unified State school administration, creating the State Council of Education. One of the best evidences of the results was the remarkable response of the teachers to the new demands for improved qualifications. The number of pupils in the State in 1913-14 was 1,401,325. The enrollment in 1925-26 was 1,849,163; of this number, 1,581,767 were enrolled in the kindergarten and elementary schools, and 267,396 were enrolled in the high schools. The total expenditures for public day schools in 1925-26 were: current, \$137,554,666; outlays for buildings, sites, or equipment, \$32,088,623. The

percentage of illiteracy in the State decreased from 7.3 in 1910 to 6 in 1920, among the native white population, from 1.8 to 1; among the foreign-born white, from 20.8 to 20.1, and among the Negro population, from 11 to 7.3.

Finance. State expenditures in the year ended May 31, 1927, as reported by the U. S. Department of Commerce, were, for maintenance and operation of governmental departments, \$82,222,896 (of which \$23,658,223 was aid to local education); for conducting public-service enterprises, \$78,079; for interest on debt, \$4,103,911; for permanent improvements, \$30,709,012, total, \$117,113,898 (of which \$37,967,816 was for highways, \$11,850,441 being for maintenance and \$26,117,375 for construction). Revenues were \$130,938,414. Of this, special taxes formed 40.9 per cent, departmental earnings and charges for officers' services, 7.2 per cent, sales of licenses and taxation of gasoline, 39.8 per cent. No general property tax was levied by the State. Net State funded debt on May 31, 1927, was \$92,400,007; all but a relatively small part of the total was in highway bonds.

Political and Other Events. Pennsylvania has remained strongly Republican throughout the political vicissitudes of recent years. In 1914 Martin G. Brumbaugh, Republican, was elected governor. The Republican candidate for reelection to the Senate, Boies Penrose, likewise won. In 1916 Philander C. Knox, Republican, was elected to the United States Senate. In the presidential election that year, Hughes received 703,823 votes, Wilson, 521,784. The 1917 municipal primary elections in Philadelphia and Pittsburgh were marked by factional bitterness. In 1918 William Cameron Sproul, Republican, was elected governor, together with the entire State ticket of that party. In 1920 Boies Penrose was reelected to the Senate, with 1,067,989 votes. In the presidential voting, Harding received 1,218,216 votes; Cox, 503,813. President Harding appointed two Pennsylvania Republicans to cabinet positions. They were Andrew W. Mellon, Secretary of the Treasury, and James J. Davis, Secretary of Labor. Senator Knox died suddenly in October, 1921, and William E. Crow of Uniontown was named to succeed him. Senator Penrose, the recognized leader of the State Republican organization, died at the end of the year. George Wharton Pepper was appointed to his place. In August, 1922, Senator Crow died. He was succeeded by David Aiken Reed of Pittsburgh. Gifford Pinchot was elected governor in 1922 over John A. McSparran, Democrat, head of the State Grange. Senators Pepper and Reed were elected at the same time. In 1923 Governor Pinchot was largely instrumental in averting a threatened anthracite-coal-miners' strike. In the spring election of 1924, the people approved a constitutional amendment providing an additional \$50,000,000 bond issue for roads. In June, 1924, W. Harry Baker was reelected chairman of the Republican State Committee without opposition, while Joseph F. Guffey, after a bitter fight, seized control of the Democratic organization in spite of opposition.

The popular vote of 1923 had approved a constitutional amendment setting at \$100,000,000, in all, the amount that the State might issue in road bonds, excepted from the general debt restriction. When the whole amount had been issued and a part redeemed, the State sought to

put out new road bonds up to the \$100,000,000 limit, but the State Supreme Court held, July 2, 1928, that the amendment of 1923 provided only for an original issue to that limit, not for a perpetual borrowing capacity.

An effort was made in Philadelphia to reform the police and clean up the city by putting Brigadier General Smedley D. Butler, U.S.M.C., in charge of the Department of Public Safety, 1924-25. The presidential vote in 1924 was: Coolidge, 1,401,481; Davis, 400,192; La Follette 307,567. John S. Fisher, Republican, was elected governor in 1926. William S. Vare, Governor Pinchot, and Senator Pepper sought the Republican nomination for Senator in 1926, and all spent great sums in the primary campaign. Vare won the nomination and was elected, but W. B. Wilson, Democratic candidate, charged election frauds and contested the result. The United States Senate in 1927 failed to admit Vare and commenced an investigation of his case that continued in 1928. A strike in the anthracite mining industry in 1926 lasted for more than five months, caused wage losses of about \$150,000,000, and involved some 158,000 workers in considerable hardship. It ended in an arbitration of wages. A bituminous miners' strike in 1927 was calamitous for the workers, many of whom were compelled not only to abandon the old wage scale but to revert to the open-shop system in 1928. The industry having been overmanned, many lost employment. In 1928 the presidential vote was: Hoover, 2,055,382; Smith, 1,067,586. At Philadelphia, the Sesquicentennial Exposition commemorating the Declaration of Independence was held in 1926, the City of Philadelphia meeting some \$17,000,000 of costs involved.

Legislation. The Legislature of 1915 approved a resolution for a State constitutional amendment providing for woman suffrage, which was later rejected by popular vote. In 1917 a direct inheritance-tax law was passed. As a war measure, a State council of defense was created and \$5,000,000 provided for it. In 1921 bitter opposition developed to a legislative programme proposed by Governor Sproul. On April 25, his supporters held a rump session, ousted the Speaker, elected another in his place, and passed all administration measures. These included taxes on anthracite and gasoline, a measure repealing nonpartisan election laws in Pittsburgh and Scranton, and a bill creating a State department of public welfare. The 1923 Legislature passed a modified old age pension bill, approved a measure providing for a constitutional convention in 1926, subject to the approval of the voters, and favored a constitutional amendment providing a \$35,000,000 bond issue for a soldiers' bonus, which had been approved also by the 1921 Legislature. The gasoline tax was increased and a small tax placed on profits. An extensive reorganization of the State government, proposed by Governor Pinchot, was adopted. In 1924 the State Supreme Court ruled that owing to technical defects the proposed soldiers'-bonus amendment could not be submitted to the people. In July, 1924, the Dauphin County Court held the old-age pension bill unconstitutional. An enactment of 1924 made the alternative penalties of death and life imprisonment for first degree murder discretionary with court or jury. Governor Pinchot in 1926 called two special sessions to enact extensive changes in the election law and a pro-

gramme of State-directed coal and water-power development, but disagreed with the Legislature in both matters, so that his programme fell. A commission to study election reform was created in 1927; a State mothers'-aid bill was enacted.

PENNSYLVANIA, UNIVERSITY OF. A non-sectarian institution of higher education located at Philadelphia, Pa., founded in 1740 and developed by Benjamin Franklin. During the period from 1914 to 1928, the student enrollment in regular courses increased from 2245 to 14,647, the faculty from 241 to 1350 members, including administrative officers and research workers, and the library from 75,000 to 675,000 volumes. The development of the university during this period is indicated by the establishment of the following separate schools, each with its own dean or director: (1) school of education, established in 1914; (2) graduate school of medicine, formed in 1919 by merger with the university of the Medico-Chirurgical College and Hospital and the Philadelphia Polyclinic Hospital and the College for Graduates in Medicine; (3) school of hygiene and public health, developed in 1920 from the former laboratory of hygiene; (4) the school of fine arts, formed in 1920 by merger of the former separate departments of music and architecture; (5) the Moore School of Electrical Engineering, established in 1923 by merger of courses in electrical engineering with the school of electrical engineering provided for in the will of the late Alfred Filler Moore. The endowment available for this school was \$1,600,000. Other developments were the reconstruction of the athletic stadium on Franklin Field in 1926, which had a seating capacity of approximately 80,000, an indoor stadium, called the Palestra, seating 10,000, a new gymnasium with swimming pool; and an auditorium seating 2500.

Among the gifts received during the period were: \$400,000 from the estate of Dr. J. William White to establish the White professorship of surgical research; \$500,000 from Helen T. Massey to increase salaries of faculty members in the college; \$549,736 from the estate of William B. Irvine to construct an auditorium; \$113,518 from the estate of Abraham S. Wolf, through the generosity of Miriam H. Wolf, for a ward in the University Hospital; \$250,000 from the Carnegie Foundation for research in medicine; \$500,000 from Mr. and Mrs. Henry Phipps for the endowment of the Phipps Institute; \$100,000 from Mrs. Mary A. Sharpe for the endowment of the Sharpe Memorial Gallery Fund in the University Museum Building, erected and endowed by means of another gift amounting to \$100,000 from Eldridge R. Johnson; \$150,000 from the estate of the late Miss Nina Lea for the establishment of the Henry Charles Lea Professorship of History; a bequest under the will of the late Craig D. Ritchie of \$106,000, \$21,000 of which is for endowment of the library; \$100,000 from Col. Louis J. Kolb to establish the Kolb Foundation for the Treatment of Cancer; \$125,000 for medical research; \$1,000,000 to establish a foundation for the advancement of medical science and promotion of education in the liberal arts, from Edward B. Robinette; \$700,000 from the estate of Charles Lenning in aid of instruction in theoretical and practical mechanics and to provide free scholarships. In addition to buildings mentioned in these gifts and bequests, other additions to the physical plant included the J. William White Surgical Pavilion; a maternity building for the University Hospital; a new Graduate

School Hospital; an anatomical wing for the medical laboratories; a new wing for the University Museum and the F. S. McIlhenny Dormitory. The productive funds of the university in 1928 were \$13,916,495 91. In 1927 administrative changes were made in the university organization which included the addition of several vice provosts each in charge of a distinctive function, all assisting the head of the institution. Provost, Josiah H. Penniman, Ph.D., Litt.D., LL.D.

PENNSYLVANIA STATE COLLEGE. A nonsectarian, coeducational institution at State College, Centre County, Pa., founded in 1859. The student enrollment of the college increased from 2245 in 1914 to 4069 in the fall of 1928, not including 2786 students in the summer session of that year. In the same period, the faculty increased from 241 to 325 members, including the extension staff, and the library from 7500 to 108,569 volumes. A group of four large engineering buildings was completed in this period in addition to a mechanical engineering building finished in 1920. A residence hall for men and a beef-cattle barn were completed in 1923, and an 18-hole golf course was laid out. Farm land holdings were increased to 2000 acres and the campus proper to 200 acres. A graduate school was authorized in 1922 and a school of education was created in 1923. A large storage building was completed in 1927 and a further building programme was begun, including plans for an infirmary, a gymnasium, a sheep barn, a veterinary hospital, a poultry-brooder house, an addition to the dairy barn, and a winter-sports park. Other units under construction in 1928 included those for engineering, chemistry, biology, agricultural departments, and a students' union. Productive funds of the college amounted to \$517,000 in 1928 and the annual income to \$3,499,453 33. In 1927 Ralph D. Hetzel, LL.D., succeeded John Martin Thomas, D.D., LL.D., as president.

PENNSYLVANIA UNIVERSITY MUSEUM. See EXPLORATION.

PENOLOGY. An outstanding event in penology in the period following 1914, was the extension of the plan of inmate self-government to prisons for male adults. This plan was not of sentimental origin, as some critics have charged, but was based on the therapeutic principle that to reform law-breakers it is wise to hold them during confinement in a social *milieu* similar to that into which they will later be discharged, and further to give them an opportunity to use, under such limits as restraint imposes, those faculties or qualities of self-reliance, initiative, judgment, and responsibility which normal life requires. As such, it is opposed to the traditional system of autocratic discipline or rule in prisons, by which substantially every movement of the prisoner's day is fixed for him. Self-government had been a feature of the George Junior Republic, founded by William R. George at Freeville, N. Y., in 1895, and in 1912 Calvin Derrick had adapted the plan to the State Reformatory at Ione, Calif. The first extension of the idea to adult male prisoners was made at the New York State Prison at Auburn, N. Y., in 1914, under the unofficial inspiration and guidance of Thomas Mott Osborne, who later in the same year became warden of Sing Sing, another prison for confined male offenders in the same State, and incorporated the plan there. In both instances, the self-governing body was named the Mutual

Welfare League. Each incoming prisoner became a participant in the self-governing activities and could be expelled by the members. Later, Osborne put the plan into effect at the United States Naval Prison at Portsmouth, N. H., where he was commandant for two years.

The period under review saw a serious preoccupation with the status of the prisoner as a problem in behavior. In general, actual treatment in penal and correctional institutions may be said to have responded slightly to the doctrine that, since all prisoners, except those who are executed or actually confined for life, are ultimately restored to society, they should be so treated as to make them better members of society. This has led, with other things, to an agitation for more vital education and a more educative vocational life. Farm prisons on wide acreage have been established in several States, and more careful assignment of prisoners to work has been made in some prisons. The principles of the indeterminate sentence, probation, suspended sentence (especially for first offenders), separate or juvenile courts for children, and parole or after-care attention for released prisoners were accepted to a somewhat greater extent by judges, lawmakers, and prison officials, probation was slightly extended to adult offenders. The county jail, in which both sentenced prisoners and persons merely awaiting trial were commonly kept, was increasingly seen in a bad light, although little actual attempt was made to improve it or to alter its function.

Problems of penology attracted increased attention in 1929 on account of outbreaks and violence on the part of prisoners at Dannemora and Auburn prisons in New York State and at the Federal Penitentiary at Leavenworth, Kan. Overcrowding was assigned as a leading cause, but it was apparent that there were deeper-seated problems.

Crime. In the post-war period and particularly in the years following 1924, the prevalence of crime in our large cities became one of the outstanding public questions and, with prohibition, occupied first place in the public attention. In the beginning, there was much talk of crime waves and alarmists who urged all sorts of horrendous proposals were given serious heed, but as the debate and study took more elaborate turns, it became apparent that strong-arm measures were no remedy. The activities of serious students disclosed the following state of affairs: the country was in no position to talk of the increase or decrease of crime because there existed no body of comparable statistics; criminals appeared to be younger; they no longer operated in gangs to nearly the same extent as formerly, police systems were in many instances inadequate; punishment appeared to be no deterrent; the death penalty was increasingly being attacked; not enough attention had been paid to the preventive aspects of crime or to the aid that might be obtained from medicine and psychiatry.

The whole discussion was of the utmost importance because it concentrated attention on the inadequate judicial procedure, on the whole theory of punishment, and on the inadequate study of the field of behavior. What were the causes of crime? There was a great variety of reasons suggested, some negligible, some showing a profound study of the question. Silas H. Strawn, president of the American Bar Association, in 1928 in his presidential address before

that body, gave the following list as having helped in the increase of crime: 1. Prohibition and the inadequacy of the enforcement machinery, which encouraged bootlegging, "hi-jacking," etc. 2. The development of hard roads and automobiles, making get-aways easy. 3. Increased wealth, making the purchase of automobiles and firearms possible. 4. Organized crime, making possible the alliance between criminals and corrupt politicians. 5. Delay in apprehending criminals and meting out justice. 6. Indifference of citizens to their duties as jurymen. 7. Unrestricted sale of firearms. Other causes cited were the following: the wide powers of parole boards and the use of the indeterminate sentence; the coddling of prisoners; the failure of educational authorities to preoccupy themselves with pre-delinquents; the failure of public authority to avail itself of the contributions of medicine and psychiatry.

Real efforts were made by at least two organizations to get at the roots of crime. In 1925 there was created the National Crime Commission for the purpose of assembling statistics, preparing a preventive programme, and reporting the defects existent in the administration of justice. F. Trubee Davison was the first chairman of the commission and he was succeeded by Newton D. Baker in 1928. During 1926-28, various sub-committees of the commission published reports on a variety of subjects. The commission's inquiry into "Criminal Procedure and Judicial Administration" led to the issuance of 20 recommendations among which were the following: paroles should be tightened; public defenders should be established; the Federal government should restrict the sale of firearms. In 1928 reports were issued on the status of the insanity plea with particular regard to the susceptibilities of jurymen, on the inefficiency of police systems, and on the prominent rôle being played by the "fence" in crime.

At its 1927 conference, the commission showed that its attitude was largely conservative and traditional. It defended the severity of punishment, showed it believed that punishment was a deterrent, and warned the public against over-sentimentalizing of the criminal. The New York State Crime Commission also sought to learn more about the reasons for the prevalence of crime. As a result of initial investigations under Senator Baumes, it brought in a series of measures that was adopted by the New York Legislature in 1926.

These laws were concerned for the most part with making punishment more drastic. For example, the so-called Baumes Laws raised the minimum term for burglary to 15 years, modified the systems of convict parole and commutation of sentence, and made it obligatory upon all judges to sentence to life imprisonment all offenders guilty of a fourth felony. In all, 25 such measures were passed. Other States, persuaded that severe punishments were deterrents, passed similar statutes. States to follow the example of New York were North Dakota, Kansas, Oregon, California, New Jersey, Vermont, and South Dakota. During 1927-29, sub-committees of the New York State Crime Commission continued to sit and the commission issued a variety of useful reports on various aspects of crime including studies of penal institutions, vocational therapy among prisoners, the place of the county jail, truancy and juvenile delinquency, etc. It should be reported that, after

1926, the New York Legislature refused to render more severe the State criminal code.

Much attention was given during the period to the place of psychiatry in crime. Massachusetts passed the so-called Briggs Law which created a board of psychiatrists who were to act as friends of the court. These physicians were to examine individuals indicted for capital offenses or second offenders of felonies, and to advise the court on the question of sanity. Colorado enacted a somewhat similar statute. In 1927 Governor Alfred E. Smith of New York urged the passage of legislation which would permit scientific examination of criminals and even take the power of sentence out of the hands of the court, these functions to be administered by a board of psychiatrists.

Throughout the country generally, little thought had yet been given to the medical aspects of crime. Out of 1168 courts answering to an inquiry, only 110 reported some regular psychiatric service and out of 259 penal institutions reporting, only 29 declared that they had full-time psychiatrists on their staffs. This deplorable state of affairs existed despite the fact that psychiatry had definitely demonstrated its usefulness in classifying prisoners, i.e., singling out those for probation, indicating those who needed confinement in institutions for mental defectives, etc. Chief Justice Benjamin N. Cardozo, of the New York Court of Appeals, lent the prestige of his name to the demand for a psychiatric approach when, in 1928, he declared that the work of biochemists, behaviorists, psychiatrists, and penologists must transform the system of punishment and that the death penalty would seem to the next generation "an anachronism too discordant to be suffered."

It is apparent that the subject was largely a speculative one and this was due to the non-existence of statistics on crime. Students pointed out. 1. There was no central agency for the collection of crime statistics. 2. There existed no classification of crime to permit of the comparison of such statistics as local agencies might compile. 3. There were no competent experts at work to collate important data (with perhaps one exception). To improve this situation, the National Crime Commission made the following concrete proposals in 1927: 1. The establishment by each State of a bureau of criminal statistics and a bureau of criminal identification. 2. The use, as Federal clearing houses, of the Bureau of Census and the Bureau of Identification of the Department of Justice. Dr. Frederick L. Hoffman, during the period under review, published the only intelligent statistics relating to crime and these were concerned only with homicides committed in a large number of cities with whose police authorities he was able to establish contacts. For the year 1927, for example, he found that a total of 12,000 murders had been committed, making a rate of 101 per million of the population. In 1928 the rate was the same. This rate was double that of the year 1900. In 1928, Detroit, among the larger cities, occupied the first place on the basis of homicidal deaths in relation to population. The Detroit rate per 100,000 of the population was 16.5; the Chicago rate was 15.8; Cleveland, 13.3; Philadelphia, 8.8; New York, 6.7; Los Angeles, 4.7. The Chicago rate had increased from 14.1 in 1927 to 15.8 in 1928. In other words, murders in Chicago were about 50

per cent greater than the average for the country as a whole. Interestingly enough, the murder rates of Southern cities were very much higher. In 10 Southern cities, the range of rates was from 60.5 per 100,000 of the population in Memphis to 25.9 in New Orleans. In the 10 cities of Memphis, Birmingham, Jacksonville, Atlanta, Little Rock, Macon, Savannah, Nashville, Houston, and New Orleans, 731 homicides had been committed during 1928, or a rate of 38.6 for their combined populations.

What Dr. Hoffman says about these Southern cities is interesting: "The ten cities are all located in States in which the death penalty is enforced with a fair degree of rigorous impartiality, but they are likewise located in States where the gun-carrying habit is common and the sale of firearms and ammunition is practically unrestricted. About three-fourths of all the deaths from homicide in Southern States are due to firearms." Dr. Hoffman suggests control in the traffic of firearms and elimination of the death penalty for murder. Of the death penalty, he says: "The death penalty, rather to the contrary, acts as a deterrent to swift and adequate justice, imposes heavy burdens upon the taxpayers as the result of long trials, fosters sensationalism of the worst possible type, and stains the civilization of those who enforce it."

The only other statistics available were those of the Federal census of prisoners in Federal and State prisons, but these were for 1923. They showed a decline in commitments of one-third for each 100,000 of the population, as compared with the year 1910, the ratio of commitments per 100,000 of the population in 1923 being 325.1 and in 1910, 521.7. In 1923 there were 357,493 commitments, as compared with 479,787 in 1910.

In the spring of 1919, President Hoover took official notice of the crime situation when he appointed the Law Enforcement Commission to study the matter comprehensively and to prepare suitable recommendations.

PENSIONS. See LABOR LEGISLATION; MOTHERS' PENSIONS; OLD-AGE PENSIONS; SOCIAL INSURANCE; UNITED STATES

PEPPER, GEORGE WHARTON (1867-). An American legislator (see VOL. XVIII). In 1914 he participated in the movement for national preparedness. During the World war, he was chairman of the Pennsylvania Council of National Defense and in 1920-21 a member of the Commission on Constitutional Revision of Pennsylvania. Following the death of Senator Penrose, he was appointed by the Governor of Pennsylvania to succeed Penrose and held office until after the popular election in November, 1922, when he was elected for the term ending in 1927. In June, 1922, he was chosen a member of the Republican National Committee to succeed Senator Penrose. On taking his seat in the Senate, he assumed a prominent place in the debates and work of that body. In 1926 he entered a primary race for renomination which was hotly contested by Governor Pinchot and W. S. Vare. Each of the contestants spent large sums of money in the campaign and in the end Vare was successful. He wrote *Men and Issues* (1924).

PERAK. See MALAY STATES, FEDERATED.

PERCEPTION. The problem of perception has been the stumbling block of scientific psychology ever since its inception. The reason for this is quite simple. Positive science has always been committed to the atomistic analy-

sis and to the mechanistic explanation in general. In the physical sciences, the perception of objects, i.e., the perception of unities over and above the conglomeration of atomic elements, was always taken for granted; but psychology, so far from avoiding this problem, attempted to deal with it by the orthodox method of atomic divisions. Metaphysically, the task was complicated by the relation of body and mind, or matter and consciousness. At the very outset of modern science, the paradoxes of Descartes's mechanistic dualism had become apparent to every reflective thinker, and not even Leibnitz's ingenious hypothesis of preestablished harmony could bolster up the belief in a strict causal correspondence between physical and mental events. The psychological analysis of Locke, Berkeley, and Hume had later transformed the problem, and when nineteenth-century psychology took the field, it had the great advantage over the Cartesians of coupling an improved physiological technique with a more refined method of psychological introspection. Withal, it was committed to psychophysical parallelism and, although this doctrine was discredited philosophically, it seemed to impose itself scientifically by the very necessities of experimentation.

The orthodox method of explaining perception was to split up the problem into sensation, image, memory, association, and attention. The sensation was a unit element of psychological experience corresponding to a specific physical stimulus. As the sensation fades out of consciousness, it becomes a potential image, for the stimulus leaves a residue in the nervous system which is capable of arousing a faint copy of the original sensation. Since each sensation leaves behind it a separate residuum, there is a vast number of such residua in memory, each of which may be separately aroused, thus allowing for a certain independence of the original arrangement in which the sensations were experienced. At this point, the doctrine of association is invoked to provide an *ad hoc* explanation for the selection of certain memories on the occasion of a particular stimulus instead of any others. The doctrine of association dates back to Aristotle and the reason for its long life is its ambiguous meaning, expressing, as it does, both a dynamic process and a static law of memory. According to the doctrine, sensations or images tend to call up memory images which are similar to, or which have once been experienced in, spatial or temporal contiguity with the present sensations or images. All attempts on the part of modern psychologists to reduce similarity to spatio-temporal contiguity which could be measured quantitatively and statistically in the laboratory have failed. Now similarity of meaning in experience is not something that can be determined in advance, but *ex post facto* one may always say that a bond has become established between the old bit of experience and the new; in this case, we are speaking of association as a dynamic process. It is questionable whether by this explanation we are really adding knowledge or whether we are not merely picturing the act of mnemonic imagination itself.

Similarity of meaning is thus seen to be the very nature of the associative process, for contiguity in time and space is but one of the lowest forms of this similarity and, fortunately, a form whose properties can be studied in ad-

vance of objective content; but for modern psychologists, as Koffka points out, meaning is itself explained by the working of associations which in themselves are meaningless. There is perhaps no better commentary on this attitude than the vast amount of experimental work which has been done on the memorization of nonsense syllables. This work was performed on the theory that one was getting at the fundamental conditions of memory, but actually all that was accomplished was the formulation of statistical and contingent laws for the memorization of specific nonsense syllables. One may contrast with this type of experimentation the direct clinical methods invoked by the new psychology. So far from attempting to determine the conditions of memory and association along merely spatial and temporal lines, which must necessarily be limited at best to nonsense syllables, a psychiatrist like Jung attempts to determine concretely for a given person in a given situation the method behind the person's imagination. See ASSOCIATION TESTS. He does this by noting down the random associations, together with any expressions of emotion, which certain words call forth from a patient. The task here falls entirely on the psychiatrist, for there is no mechanical rule by which to measure the minds of all men; some general notions and a practical sympathy and skill on the part of the observer simply enable him to picture in his own mind the process of his patient. It is, moreover, significant to point out the failure of the attempts made by Freud's disciples and by Freud himself to take the master's solution of specific dreams on the basis of certain symbolisms as scientific and as valid for all cases, instead of as suggestive examples to incite the use of one's creative imagination.

Turning now to attention, we find here the great scapegoat of experimental psychology. While every direct study of attention has sought to define it in terms of the stimulus and the physiological process, yet, in experiments on perception, it was treated as a mental element, as an unpredictable determining tendency which prevented the expected reaction from taking place. In short, so far from using a strict parallelistic procedure, experimental psychologists explained conscious phenomena in a physiological fashion whenever they could and then invoked mental concepts to explain discrepancies. Behind these mental concepts, such as attention, association, and memory, they indeed postulated corresponding physiological entities; but these were in no wise observable and amenable to scientific measurement. In Germany, the school of the *Gestaltqualität*, or form quality, following up Wundt's conception of creative synthesis, had given up the attempt to maintain psychophysical parallelism in the higher mental processes. They emphasized the fact, well known in music and duplicated in other phases of psychological experience, of the form of perception existing over and above the so-called objective content. Thus, a melody has a real quality over and above the physical notes of which it is composed, since it may be transposed to totally different notes, provided the order and rhythm are maintained. On this theory, all higher-perceptual acts are instances of forms which have reality of their own, although they are ultimately "founded" on sensations with their psychophysical relationship of stimulus and consciousness.

Between the *Gestaltqualität* psychologists, such as Meinong, Ehrenfels, and Witasek, and their radical descendants, the school of *Gestalttheorie*, there may be traced an evolution almost identical with that which occurred in philosophy in the descent from Locke to Berkeley and Hume. Locke began with sensation produced by external substances and with reflection which the mind contributed to the ordering of its external impressions. Berkeley and Hume found the Lockian conception of external substances completely useless, inasmuch as these substances could not be known except through the "higher" faculties of reflection, which in the nature of the case are subjective. So the final result of the current of criticism which Locke started was the development of empirical or phenomenal idealism. In point of fact, what the *Gestalt* psychologists did was to apply experimentally the idealistic criticism to structural and physiological psychology. Only recently, Dr J. S. Haldane, the eminent Oxford biologist, had publicly declared that, although he was a physiologist, he "could not for a moment agree with the assumptions on which what is called physiological psychology is ordinarily based. These assumptions appear to me as a mixture of very rudimentary physiology with a psychology which has been obsolete since Hume and Kant. It is doubtless the case that a very wide public is still ready to accept the assumption in question, but a still wider public would accept the assumption that the sun goes around the earth." (*Proc. Arist. Soc.*, Sup. vol. III, p. 65).

Among the assumptions that Dr Haldane had in mind is the constancy hypothesis, according to which a definite conscious sensation corresponds to every single stimulus. This assumption having been riddled experimentally by the proponents of form-quality, it remained for the more radical psychologists to show that the whole notion of an objective physical or physiological stimulus is quite misleading. They did this by reinterpreting in a new fashion the standard experiments with changing figures and perceptions of movement. In his laboratory studies of visual movement, Wertheimer showed how both the illusion and direction of movement could be obtained by preparing a pattern in the mind of the observer. Thus, if in the tachistoscope the experimenter exposes in succession two lines, first an oblique line making an acute angle with the horizontal, and then the horizontal itself, the observer will see the oblique line rotate in the direction of the horizontal, passing through the acute angle. Now, if the experiment is repeated and the size of the angle is increased gradually until it passes a right angle and becomes an obtuse angle, the observer will still see the oblique line rotate in the original direction. If the experiment had been started with the oblique line making an obtuse angle, the illusion of rotation would have come about in the other direction, the illusion of movement being produced in the direction of the supplementary acute angle.

In the case of changing figures, which structural psychology had never been able to explain satisfactorily, even the subsequent distinction between form and objective content was valueless. Here, there was no fixed physical content with a perceptual form superimposed, but rather there was an alternation of figure and ground, with the figure becoming the ground and the ground the figure when the meaning of

the experience changed. Add to these experiments the investigations of Kohler on the perceptual experiences of animals, and the foundation was laid for a new systematic approach to psychological experimentation. The question which Kohler set himself to answer was this: If an animal is confronted with two stimuli and is trained to react positively to the one and negatively to the other, what has it learned? According to traditional theory the animal has formed a connection between the one sensation corresponding to the first stimulus and the positive reaction, and likewise between the other sensation and the negative reaction. Kohler, however, introduced an experimental variation which tested this theory. He placed before the animal two stimuli, *b* and *c*, the one lighter and the other darker, with variations in their spatial arrangement. From *b* food could be taken but not from *c*. After a certain amount of training, the animal invariably chose the positive *b*. Then this pair of stimuli was replaced by another pair, *a* and *b*, with *a* lighter than *b*. The animal now reacted not to the stimulus *b*, as the older theory would suppose, but to *a* as the lighter stimulus. The conclusion was inevitable that animals learned to perceive structures and forms rather than identical physicochemical stimuli. The same set of experiments was repeated in the case of fowls, chimpanzees, and a three-year-old child, and the results were the same, this showed that the principle was sufficiently fundamental to be continuous in the biological realm.

The theory of perception which the new school of *Gestalt* psychology has built up is that in the act of perception the entire configuration is cognized and not an isolated object. If we see a specific object, we see it in much the same way that we appreciate the subject of a tableau. The centre or focus of the picture is unintelligible without the background. Carrying this analysis further back, the theory holds that in every act of perception the general psychological state constitutes the field or screen and the external stimulus, the picture on the screen. Field and object are thus relative to one another, but the relation of relativity, if we may so speak, is not constant and predetermined. For certain configurations one may alter the background within various limits and not change the perception of the object. Again, object and background are relatively interchangeable but not absolutely so. This interchangeability or reversibility reaches its maximum in the case of the angular drawings and changeable figures mentioned above, which may be seen facing either "inward" or "outward" at the will of the observer, provided his frame of mind has not been prepared. According to this theory, the experimental psychology of perception has for its task the determining of specific relationships existing between so-called objective stimuli and the various frames of reference in which they happen to be put. In other words, experimental psychological analysis would not be different from analysis of the artist who steps back from his picture and tries to see it at the distance from which it would be seen in the salon. The picture, we may say, remains the same, but the perception of the picture, which is what actually counts, varies in accordance as it is seen at a six-inch or a three-foot distance, in accordance as it is seen with the eye of a connoisseur or with the untutored eye of the man in the street.

The *Gestalt* school has produced a number of echoes from America. R. M. Ogden in numerous articles expounded a theory of meaning embracing the general view of the new psychology; but the mass of experiments on perception will probably continue to be interpreted from the methodological approach of introspective structuralism with its postulate of psychophysical parallelism. See **PSYCHOLOGY, GENERAL**.

Bibliography. For the theoretical discussion of the problem of perception, consult the article by Kurt Koffka, "Perception: an Introduction to the 'Gestalttheorie,'" together with the appended references, in the *Psychological Bulletin*, vol. xiv, 1922, p. 531. For a general presentation of *Gestalt* psychology, see W. Kohler, *Gestalt Psychology* (1929). For additional references on the experimental side of perception, consult the *American Journal of Psychology*, vols. xxxiii and xxxiv, particularly the articles of F. L. Dimmick, M. Zigler, L. W. Cobbe, A. H. Sullivan, E. Bershansky, L. Knight, and E. Shults.

PERCY, pĕr'st, THE RT. HON. LORD EUSTACE (1887-). A British government official, educated at Oxford, whose early career was that of a diplomat. A Unionist, he entered Parliament in 1921, was parliamentary secretary to the Board of Education for two months in 1923, and then to the Ministry of Health (1923-24). In the autumn of 1924, he became a member of the Privy Council and he was president of the Board of Education (1924-29). He wrote *The Responsibilities of the League* (1920).

PEREZ, pĕr'áth, JUAN BAUTISTA (1870-). A President of Venezuela, who was born at Caracas and trained for the legal profession at the law school there. He held many judicial posts previous to his election as President in 1929. He succeeded to the Presidency when General Juan Vicente Gómez refused reelection after 21 years in the office.

PÉREZ DE AYALA, pĕr'áth dā ā-yā'lā, RAMÓN (1881-). A Spanish novelist, poet, and critic. Born in Oviedo, he took his bachelor's studies at the Gijón and Carrion de los Condes, under the instruction of the Jesuits, and received his degree of licentiate in law from Oviedo, where he was a pupil of Clarin. He traveled widely in France, England, Germany, and the United States, and during the World War, visited the French, English, and Italian fronts as a war correspondent for the Buenos Aires newspaper, *La Prensa*. His first book of verse, *La paz del sendero* (1904) was highly praised by Rubén Darío and shows that beautiful, harmonious verse can be a vehicle for sound thought. In his prose, he represents the modern movement toward fusion of the critical and creative elements in literature. In 1907, under the pseudonym of Plotino Cuevas, he published his first novel, *Timeblas en las cumbres*. His work *A. M. D. G.* (1910) is an attack upon the educational system of the Jesuits. Among his many works, the best are *Trotteras y danzaderas*, a novel (1913), *El sendero unnumerable*, poems (1916); *Prometeo*, *Luz de Domingo*, *La caída de los limones: tres novelas poemáticas de la vida española* (1916), *Hermán encadenado* (1917); and *Política y toros* (1918).

PERIODIC SYSTEM. See **CHEMISTRY; PHYSICS**.

PERKIN, WILLIAM HENRY (1860-1929). An English chemist (see VOL. XVIII). He has been Waynflete professor of chemistry and fellow

of Magdalen College, Oxford, since 1912. In 1913-15 he was president of the Chemical Society and in 1926 received the Royal Medal of the Royal Society.

PERKINS, FRANCES (1882-). An American sociologist, born at Boston and educated at Mt. Holyoke College, the University of Pennsylvania, and Columbia University. From 1907 to 1909, she was secretary to the Philadelphia Research and Protective Association, and from 1910 to 1912, executive secretary of the Consumers' League. She was director of the investigations for the New York State Factory Commission in 1912-13 and executive director of the New York Council of Organizations for War Service from 1917 to 1919. In 1919-21 she was a commissioner of the New York State Industrial Commission and a member of the State Industrial Board after 1923 (chairman after 1926). Gov. F. D. Roosevelt promoted her in 1928 to the position of Industrial Commissioner at the head of the State Department of Labor. She was a member of many sociological and economic societies and wrote *Life Hazards from Fire in New York Factories* (1912); *The Problem of Mercantile Fire Hazards* (1914); *A Plan for Maternity Care* (1918); *Women as Employers* (1919), and *A Social Experiment under the Workmen's Compensation Jurisdiction* (1921).

PERLIS. See MALAY STATES, NON-FEDERATED.

PERMANENT COURT OF INTERNATIONAL JUSTICE. See LEAGUE OF NATIONS; WORLD COURT.

PERNICIOUS ANÆMIA. See ANÆMIA.

PERRY, RALPH BARTON (1876-). An American philosopher and professor at Harvard (see VOL. XVIII). After 1914 he concerned himself largely with practical and ethical problems. His books, *The Free Man and the Soldier* (1916) and *The Plattsburg Movement* (1921), deal with the problem of military preparedness in democracy. *The Present Conflict of Ideals* (1918) is a companion volume to *Present Philosophical Tendencies*, and surveys the clash of consciences in the contemporary world. Professor Perry's other publications since 1914 include *An Annotated Bibliography of the Writings of William James* (1920), a revision of Weber's *History of Philosophy* (1925), *Philosophy of the Recent Past* (1926); *General Theory of Value* (1926); and numerous studies in American and French philosophical periodicals.

PERSHING, JOHN JOSEPH (1860-). An American army officer, born in Linn County, Mo., and educated at the United States Military Academy. He served in the Apache Indian campaign in Arizona and New Mexico in 1886, in Cuba in 1898, and in the Philippines from 1899 to 1903. In 1905 he was with Kuroki's army in Manchuria. In 1915 the tragic loss of his wife and three daughters, who were burned to death in a fire during his absence, roused the sympathy of the country. In 1916 he headed a punitive expedition into Mexico in pursuit of the bandit Villa, who had committed depredations in American territory. In September of that year, Pershing was made a major general. President Wilson made him commander-in-chief of the American forces in France in 1917, and he conducted their operations in the World War with conspicuous success. He had a free hand in the conduct of American military operations in France. When the Allies agreed on unity of command, in the spring of

1918, General Pershing, acting under President Wilson's orders, tendered the use of the American troops, then numbering over 300,000 effectives and in six months increased to 2,000,000, against Germany. The brilliant success of St. Mihiel greatly stimulated the Allied morale and depressed the German offensive. When the Armistice came, Pershing was almost in sight of his goal, which was Sedan. His contribution to the Allied victory has been widely acknowledged.

Estimates of General Pershing as a commander have been written by his officers—General James G. Harbord, his chief of staff, in *Leaves from a War Diary* (1925), and General Robert Lee Bullard, in *Personalities and Reminiscences of the War* (1925). Anecdotal material relating to Pershing is contained in *A Journal of the Great War* (1921), by Charles G. Dawes. He was appointed chief of staff of the United States Army in 1921 and at once entered on the unprecedented task of combining in one organization the Regular Army, the National Guard, and the Permanent Reserves. He was retired on Sept. 12, 1924. Since his retirement, he has served as head of a commission supervising American war memorials in France and has been largely occupied in writing his memoirs.

PERSIA. A monarchy of southwestern Asia extending north from the Persian Gulf and the Gulf of Oman to the Caspian Sea. Area, variously estimated at from 628,000 to 635,135 square miles, population, from 8,000,000 to 10,000,000. The population is polyglot, and being scattered in widely separated centres, difficult of control. In the west, Kurds, Armenians, and Arabs are to be found; in the northeast, Turks from Russian Turkestan, along the shores of the Persian Gulf, Arab and Negroid elements. Nomads number about 3,000,000, Europeans, 1200, of whom 600 were British. Populations of the principal cities are estimated as follows: Teheran, the capital, with adjoining territory, 350,000; Tabriz, 180,000; Isfahan, 100,000; Meshed, 85,000; Kerman, 40,000. About 90 per cent of the population is Mohammedan of the Shia sect.

Industry and Commerce. The large desert areas and the dependence upon irrigation for the cultivation of crops account for the comparative unimportance, economically, of agriculture. Grain crops and rice are raised for local consumption, while fruits, tobacco, cotton, and opium are exported to some extent. The sericulture and keeping of sheep support the native silk-stuff and carpet establishments. Wool and prepared skins also enter into the foreign trade. Mineral resources are extensive and include oil, iron, coal, copper, lead, manganese, marble, nickel, and cobalt, though none is worked except oil. The Anglo-Persian Oil Company (controlled by the British government) holds concessions covering all but five northern provinces and though the workings are as yet confined only to a single area, the wells yielded 2,959,000 tons in 1922-23 and 5,107,081 tons in 1926-27. The indications are that the Persian oil fields are among the richest in the world. The importance of oil in the economic life of the country may be gauged from the fact that while before the War its export was negligible and in 1915-16 was valued at only 21,758,000 krans (1 kran = 9 cents), by 1927 the oil export totaled 654,383,000 krans, being nearly 60 per cent of the entire exports. See PETROLEUM.

Exports for 1913-14 were 455,839,635 krans; imports, 647,164,841 krans. For 1926-27 exports were 1,104,115,000 and imports 787,397,000 krans. The changing emphasis in the economic life is indicated by the following comparative figures in articles exported for 1913-14 and 1926-27 (in thousands of krans): fruits, 70,000 and 32,019; carpets, 54,000 and 122,564; cotton, 85,000 and 56,492; rice, 42,000 and 20,526; opium, 38,000 and 96,116; skins, 12,000 and 8237; petroleum, 17,000 and 654,383. Leading imports are cotton tissues, sugar, tea, yarn. Up to 1917, the country was barely touched by the World War, but following that year it suffered severely. The presence of the demoralized Russian troops through 1917, the depredations of the Turk in Azerbaijan and the rich plains of the Urumiah, and the flight of the Assyrian Christians accounted for great losses. Drought and famine visited the country in 1917; the influenza took its toll in 1918. Flocks and herds fell off greatly and through the shortage of forage, many beasts of burden were lost. The interruption of commerce with Russia visited great distress on all industries. Before the War, imports from Russia totaled 355,000,000 krans and exports to it, 300,000,000 krans; in 1927-28 imports were £16,450,193 and exports £21,617,164. The United Kingdom, British India, and Russia supplied 75 per cent of the imports and purchased 65 per cent of the exports. In 1926-27 exports to the United States were \$7,482,000; imports \$2,017,000. These more than quadrupled the 1913 trade.

Communications. Internal transport is carried on by caravan. To 1914 only 6 miles of railway were in existence. In 1916 a Russian constructed railway from Julfa (Perso-Russian frontier) to Tabriz (85 miles) was opened, another line from Pirebazar to Resht, 7 miles long, also was opened, a military railroad in southern Persia, 52 miles long, was constructed from Bushui to Borazjan, the railroad from Quetta to Nushki, in India, was extended to Duzdab. The total railway mileage was 350 miles. Preliminary survey work was completed in 1927 for a Trans-Persian Railway to connect the Persian Gulf with the Caspian Sea. In July, 1928, a German firm signed a contract involving 310 miles of the projected 1070-mile line. The section was to be completed in three years. It was to run from Khormusa, on the Persian Gulf, to Teheran, Firuzkuh, and thence to the Caspian Sea. The cost of the total project was estimated at \$80,000,000. The railways open for traffic in 1928 totaled 231 miles.

Finance. By the treaty with Soviet Russia, of 1921, all Russian loans and advances were canceled. In 1920 a British financial adviser was appointed to the Persian government, but he never actively functioned; in 1922, because of the increasing friendliness toward the United States, an American adviser was attached to the administration. See below, under *History*.

In 1927-28, according to preliminary returns, revenues totaled \$28,780,000, as compared with \$26,200,000 for the previous year. A surplus over expenditures was indicated for both years. The last budget to receive parliamentary approval was for the fiscal year 1925-26. The budget for 1926-27 was not passed. For 1927-28 expenditures were authorized monthly at the rate of one-twelfth of the sums utilized in 1926-27. The total was expected to approximate \$25,000,000. On June 20, 1927, the funded public debt totaled £1,667,621 and the floating debt,

\$788,459. Treasury resources amounted to \$19,558,000.

History. When the World War broke out, public opinion in Persia was decidedly in favor of a clash with Russia. Turkey's declaration of hostilities against Russia further increased this war spirit in Persia. The Government, however, was opposed to war, and declared its neutrality. When the Russians were asked to withdraw their troops from Persian soil so as not to entice the Turks, the Czar's government replied by sending in additional troops and organizing Persia as a military base. The consuls of Germany and Austria in northern Persia were arrested, and the property of German firms confiscated. Early in 1915, a large Turkish Army under Hussein Raouf Bey invaded Persia from the west and engaged the Russian forces. British troops were landed in the Gulf region to protect the pipe lines and oil wells of the Anglo-Persian Oil Company, and to seek to effect a juncture with their Russian allies to the north. Meanwhile in March, 1915, the Anglo-Russian Convention of 1907 was secretly amplified by the two powers to do away with the central neutral zone.

By the end of the year, Russian troops were marching on Teheran, the Turkish Ambassador to Persia was arrested, and the Persian government, on the point of fleeing the capital, presented the British and Russian representatives with the draft of a proposed alliance between the three powers; but this attempt on the part of the Persian government to save its people from the horrors of war was futile. The answer to the projected alliance was an ultimatum, dated Aug. 1, 1916, demanding that the Russian and British Armies be recognized as in occupation of Persia; that Persian Armies be raised, commanded in the north by Russians and in the south by Englishmen, and that the finances of Persia be put under the complete control of the two Allied powers. Throughout 1916 and 1917, Persia remained a battleground for her warring neighbors, and not until the Bolshevik Revolution of November, 1917, was there any hope of relief. The Bolshevik government withdrew the Russian troops from Persia at once, but no sooner was a section thus evacuated, than the British forces, who followed closely upon the Russians' heels, occupied it again. As a result, the engagements between the British and the Turks, especially in the Province of Azerbaijan, continued down to the Armistice.

The reason why Russia and Britain refused to accept Persia's offer of an alliance was that they did not want her to appear at the peace conference that would naturally follow the War. They were afraid lest the question of their respective spheres of influence in Persia be brought up at the council table for discussion. Now, however, the Persians insisted upon sending a delegation anyway, even though it was pointed out that, as a neutral, Persia had no right to participate in the negotiations. The Persian delegation, which was headed by the capable and intelligent Minister of Foreign Affairs, Aligholi Khan, presented a list of 10 specific claims which included demands for complete economic and political independence, territorial expansion, and reparation for the very heavy losses suffered at the hands of the warring nations. British intervention, however, prevented the presentation of these matters before the Conference, so that the way lay clear for the Anglo-Persian Treaty of August, 1919. By the terms of this convention,

the British government promised to respect the independence of Persia—with the following reservations: the British government was to supply expert advisers to the Persian government at the latter's expense; the British government was to furnish and equip a military force for the preservation of order in the country and on the frontiers; the British government was to grant a loan to be guaranteed by the customs revenues and other sources; railroads were to be built by British enterprise; the tariff was to be revised by Persian and British experts. The agreement never received ratification, however, and was definitely repudiated by Persia in the spring of 1921.

The Russians were quick to sense Persia's irritation over the treaty and over the continued British occupation, and proceeded to make friendly overtures and offers. The Persians, however, were still too suspicious of all foreigners to be willing to negotiate. Nor did they care to become Bolshevik themselves. Accordingly, in February, 1921, a military leader named Riza Khan Pahlevi marched on Teheran with 2500 men, imprisoned 200 of the leading pro-English officials, and set up a new patriot Young Persian cabinet with himself as commander-in-chief of the army.

Meanwhile, the steadily growing sentiment against Great Britain finally forced the British evacuation of Kazvin early in 1921, and the last remnants of British participation in internal affairs disappeared with the departure from the capital of the British controller of Persian finances and the disbanding of the South Persian Rifles (September, 1921). In March, 1921, a treaty between Russia and Persia was signed by which diplomatic rights were accorded to the former, while the Russian loans and advances were completely canceled, Russian concessions were abrogated, Russia's special rights in the northern zone under the Anglo-Russian agreement of 1907 were renounced, the Capitulations were terminated, and the Russian discount and land bank was turned over to the Persian government.

Then, in May, 1921, having become tired of the amateur methods and impractical idealism of the cabinet which he had set up previously, Riza Khan made himself military Dictator of Persia. He reorganized the army, restored order and stability, and gradually instituted economic and social reforms. In November, 1922, Dr. A. C. Millspaugh, former economic adviser to the U. S. State Department at Washington, was called to take charge of the Persian finances, while other American experts were secured to aid in sanitation, etc. Toward the end of 1923, Riza prevailed upon Shah Ahmed Mirza to take a trip to Europe, and it seemed as though a democratic republic might be set up. The monarchist sentiment among the people, however, was too strong, and the National Assembly contented itself, in March, 1924, with deposing the absentee Ahmed and installing in his place his two-year old son, with Riza as Regent.

A year and a half later, on Oct. 31, 1925, the Parliament or Mejliss deposed the entire Kajar dynasty which had ruled since 1799. On Dec. 13, 1925, Riza was elected hereditary Shah. He took the oath to defend the constitution (of 1906) on December 15, was publicly proclaimed the next day, and was crowned on Apr. 25, 1926. The new Shah notified all foreign governments on Apr. 26, 1927, that the Capitulations in Persia would be abolished on May 10, 1928. On

July 25, 1927, Dr. Millspaugh refused to accept a new contract because in it his powers were curtailed and restricted. He retired on Aug. 4, 1927, and the Mejliss passed a law engaging the German, Dr. Lindenblatt, to take his place.

In proportion as the Persian leaders grew distrustful of, and antagonistic toward, Great Britain, they displayed a very different attitude toward the United States. The success of Dr. Millspaugh in reorganizing Persian finances and the cordial cooperation of Persian authorities with American experts helped to strengthen this policy. Moreover, in the hope of securing ready capital, of which the country stood in desperate need, the Government turned to American oil companies. There ensued a tortuous series of quasi-diplomatic oil negotiations when, in 1921, the Standard Oil Company put forth claims to exclusive oil exploitation in the five northern provinces, the Anglo-Persian Oil Company countered by presenting concessions which had been obtained by a certain Russian, Khostaria, in 1896 and 1916, and sold by him to a subsidiary of the Anglo-Persian; but the latter was willing to compromise by sharing the northern field equally with the Standard. The Persian Mejliss, however, discountenanced this amicable arrangement, and, in December, 1923, the Persian government made a preliminary contract with the Sinclair interests for oil exploitation in four of the northern provinces, on condition that the concessionaries advance \$10,000,000.

Just then occurred the unfortunate murder (July 24, 1924) of the American Vice Consul in Teheran, Maj. R. W. Imbrie. He was killed by an excited mob for his temerity in trying to photograph a Shiite shrine during a religious demonstration. Although the governments of Persia and the United States eventually came to an amicable settlement over the occasion, it nevertheless made it impossible for Sinclair to raise the asked for money in New York. However, the sale of oil and railway concessions to foreign firms remained one of Persia's large sources of income.

Admitted to the League of Nations on Jan. 10, 1920, Persia continued to have rather difficult foreign relations, especially with Iraq, down to 1929. (See IRAQ.) A number of treaties of amity and commerce were negotiated with European nations, one of May 11, 1929, with Belgium, and one of May 15, 1929, with France. Considerable agitation prevailed in Persia toward the end of 1928 and in 1929 as a result of the Government's attempt to westernize the country. Thus, the Mejliss restricted the wearing of turbans or fezzes to religious leaders and theological students, while the other Persians were ordered to wear European dress and a new kind of hat called Pahlevi, after the new dynasty. It was expected, however, that the new clothing would be made within the borders of the land. The violent opposition to westernization in Afghanistan also affected the situation across the Persian border, and fired the Persian Moslems to a similar resistance. The Government, however, persisted in its efforts to emulate the Turkey of Mustapha Kemal. See AFGHANISTAN; IRAQ; PETROLEUM.

PERU. A South American republic on the Pacific coast between Ecuador and Chile. No official census was taken after 1876, with the result that estimates must be unscientific in the extreme. An estimate in 1926 put the population at 5,500,000 (as compared with 2,597,604 in 1876), though any increase in population was

questioned in many quarters. The boundaries in 1929 were not definitely settled, estimates placing the area at from 679,600 to 722,461 square miles. See below, under *History*. Lima, the capital, has a population of 220,000 and Callao, 66,000, according to a census of 1925. Arequipa was estimated to have a population of from 58,000 to 60,000.

Industry and Trade. Sugar, cotton, and coffee continue to occupy the most important places in Peruvian agricultural life. Cotton culture in 1928 brought in 80,000 tons, as compared with a crop of 26,170 tons in 1913. The values of cotton exported in the two years were 1913, 1,424,000 Peruvian pounds; 1928, 6,762,637. Sugar production in 1928 totaled 362,000 tons, as compared with 192,754 tons in 1912. Sugar exports in 1913 were valued at 1,380,000 Peruvian pounds; in 1920, 15,584,888; in 1928, 4,597,381. Among the minerals, copper up to 1920 occupied the leading place, the 1920 output being 32,982 metric tons with a value of 2,358,243 Peruvian pounds. This showed a negligible gain over 1913 output. The production in 1927 was 47,805 tons. On the other hand, petroleum production in recent years has forged steadily ahead, so that by 1920 the value of the output exceeded that of copper. In 1905 the petroleum production was worth little more than 125,000 Peruvian pounds, it reached 2,494,570 Peruvian pounds in 1920 and in 1927, 15,416,900 Peruvian pounds. Other important industries include silver and vanadium mining, wool, cacao, guano, coca, and the making of Panama hats. Exports totaled \$165,929,441 in 1920, \$93,464,350 in 1922, and \$109,277,000 in 1927, as compared with \$45,871,504 in 1912. The leading imports are, foodstuffs, cotton goods, metal goods, and machinery of all kinds. Imports for 1920 were valued at \$86,283,654, for 1922, at \$52,962,770, for 1927, at \$69,056,000, as compared with \$25,015,460 in 1912. In 1927 the United States supplied 42.3 per cent of the imports and purchased 29.1 per cent of the exports, Germany, 9.9 and 4.7 per cent; Great Britain, 15.8 and 29.8 per cent.

VALUES IN PERUVIAN POUNDS

	Imports from Great Britain	Imports from United States
1910	1,676,543	1,128,395
1914	1,598,605	1,570,723
1917	1,934,665	8,792,710
1920	2,694,195	10,168,937
1922	2,024,903	4,212,971
1927	3,075,554	8,059,809
	Exports to Great Britain	Exports to United States
1910	3,403,127	2,032,510
1914	3,403,109	3,033,259
1917	3,792,750	10,942,407
1920	12,681,632	16,265,092
1922	6,592,071	6,582,712
1927	8,825,270	8,612,405

Communications. In 1926 there were 2118 miles of railway in operation. This was a gain of 399 miles over 1912. The Peruvian merchant marine consisted of only 43 steamers of 75,814 tons in 1927. The trade of the country is carried mainly in foreign bottoms. In March, 1921, the Marconi Company took over the management of the Peruvian postal, telegraph, and wireless services for 25 years. In 1926 there were 11,929 miles of telegraph line, 986 post offices and 39,433 miles of telephone wire.

Finance. In 1929 the budget balanced at 12,583,636 Peruvian pounds. The public expenditures in 1928 aggregated 12,044,208 while the revenues were 12,198,103 (compared with the

1912 figures of 3,425,543 for revenues and 3,493,629 for expenditures, the Peruvian pound equaling approximately \$4, United States currency). In 1913 the internal debt amounted to 3,792,855, and in 1927 to 6,906,000; the foreign debt in the two years was 1,162,700 and 10,342,000; the floating debt, 5,392,457 and 2,667,000 Peruvian pounds.

Government. Up to 1920, internal affairs were the exclusive concern of the central government located at Lima, and provincial matters were handled through a corps of prefects and subprefects, responsible entirely to the President. Each of the 20 departments is under a prefect and these are divided into 114 provinces under a subprefect. There are 967 districts or subdivisions of the provinces. The new constitution of Jan 18, 1920, the result of a movement toward decentralization, provided for the installation of three regional congresses in the north, south, and centre, with considerable local autonomy. The President's term was increased to five years and he was made ineligible for a succeeding term (This provision was amended in 1923 and 1927 to permit of reelection). The number of senators was fixed at 57, deputies at 128. An important step taken was the grant of absolute political and religious liberty, though Roman Catholicism was still retained as the state religion.

History. Of outstanding importance in the period 1914-29 was the peaceful settlement in the latter year of the Tacna-Arica dispute between Peru and Chile, after nearly a decade of negotiation. Through the friendly offices of Secretary of State Frank B. Kellogg of the United States, diplomatic relations between the two countries, which had been severed for a period of 17 years, were resumed July 13, 1929. On August 29 of that year, the Province of Tacna, awarded Peru under the settlement, was formally placed under the Peruvian flag (see TACNA-ARICA DISPUTE). Agreements for defining Peru's boundaries were also entered into with Brazil, Bolivia, and Colombia, and negotiations upon the same subject were under way with Ecuador, in 1929.

The administration of Dr José Pardo (1915-19) was marked by the breaking off of diplomatic relations with Germany in 1917 and a great increase in foreign trade as a result of the demand for raw materials by the belligerent nations. In 1919 Peru's imports doubled and her exports tripled those for 1913.

The election of May 18, 1919, resulted in a dispute and the seizure of President Pardo by adherents of Augusto B. Leguía, who had served as President during 1908-14. The installation of the latter, first, as provisional President, and then as regularly elected President, followed. Under Leguía, ambitious projects were set under way for the modernization of the country. Committed to an extension of the federal principle, he promulgated a new constitution and invited foreign countries, through expert commissions, to participate in Peru's reconstruction. In 1919 an attempt was made to attract immigrants by an offer of free transportation, and the construction of the Ayacucho-Cuzo Railway to put the capital in touch with southern Peru was pushed. In 1921, arrangements were made with a British-Canadian company for the construction of some 1500 miles of railway in various parts of the country. In 1922 a programme for important irrigation works was inaugurated to centre around the Cañete and Moche rivers. An American sanitary expert, beginning with 1919, was given full powers to stamp out malaria and yel-

low fever, and in 1919, General Gorgas was requested to undertake the sanitation of Peru's important cities. The General's death temporarily checked the plan. The reorganization of the army during 1919-21 was placed in the hands of a French commission and of the navy, in 1920, under an American commission with full powers. In 1921, several American educational experts went to Peru and one of their number was made director of instruction. The beginnings of a labor code were attempted in 1924 with the passage of laws for workmen's compensation and the arbitration of industrial disputes, and the financial condition of the Government was much improved. Results of these progressive activities were at once evident. By 1922 foreign interest had increased so enormously that it was estimated British holdings totaled \$125,000,000; American, \$90,000,000; Italian, \$50,000,000; and German, \$10,000,000. Other American republics joined with Peru in celebrating at Lima and Ayacucho the centennial of the Battle of Ayacucho on Dec. 9, 1924. General Pershing headed the delegation from the United States.

Despite a constitutional provision forbidding two consecutive terms in office, President Leguía was reelected in 1924. In 1927 the constitution was amended to permit the reelection of the President without restriction and on Aug. 5, 1929, Leguía was again elected, without opposition, for the term 1930-35. His régime, which at first assumed the aspects of a benevolent dictatorship, gradually became more severe. An insurrection of peasants in November, 1924, was suppressed after two days' fighting and the revolutionary leaders were executed. In August, 1926, the Chamber of Deputies enacted a measure providing for the suspension of constitutional guarantees of personal liberty at the discretion of the Government. Another law adopted in September, 1928, designated as a capital offense any act committed by Peruvians either at home or abroad which the Government judged contrary to the social order and public welfare of Peru. The punishment provided, upon arrest and conviction, was the confiscation of the defendant's property, as well as 25 years imprisonment. The measure was designed to prevent efforts to overthrow the Government from both within and outside the borders of Peru.

Numerous political opponents of the Leguía régime, forced into exile, at this time were carrying on revolutionary propaganda from refuges in Paris, New York, Havana, and Guayaquil. An opposition paper, called *La Republica*, made its appearance in New York City in 1928. Still another decree, signed by President Leguía June 22, 1929, prohibited the teaching of doctrines opposed to the State religion (Roman Catholic) in official or private establishments. The twenty-fifth anniversary of President Leguía's advent to public life, Sept. 8, 1929, was declared a national holiday and celebrated throughout the nation. The Chamber of Deputies, by resolution, named him "Procer of Peru," a title hitherto held only by a few of the founders and early leaders of the nation. Toward the end of 1927, he inaugurated a larger naval-building programme. Peru celebrated the 108th anniversary of her independence on July 28, 1929. In connection with the celebration, the Government conferred on President Hoover and Secretary of State Stimson, of the United States, decorations of the Order of the Sun.

PESHKOV, ALEXEI MAXIMOVITCH. See GORKY, MAXIM.

PESTS, INSECT. See ENTOMOLOGY, ECONOMIO; FORESTRY; HORTICULTURE.

PÉTAÏN, HENRI PHILIPPE (1856-). A French army officer, born at Cauchy le Tour, Pas-de-Calais, and educated at Saint-Cyr and the École de Guerre. In 1914 he headed the 33rd Army Corps in a masterly retreat from Charleroi to the Marne, and in 1916, in command at Verdun, he defended it against the great effort of the Germans to capture it and retook Fort Vaux. In 1916 he commanded the central group of French Armies. Appointed commander-in-chief of the French forces on the western front, May 15, 1917, he maintained close relations with his allies, and struck the Germans with great energy at Verdun and the Chemin des Dames. He was made a marshal of France in November, 1918, became vice president of the Conseil Supérieur de la Guerre, inspector general of the French army (1922), and commanded the French forces fighting the rebellious tribes in Morocco (1925-26). In 1929 he was elected to the French Academy. Consult *Les trois maréchaux*, by Le Goffie (1919), and *Comment j'ai nommé Foch et Pétain*, by Painlevé (1924). See WORLD WAR.

PETERKIN, JULIA MOON (1880-). An American novelist. She was born in South Carolina, early left motherless, and educated at Converse College. While teaching at Fort Motte, S. C., she met and married W. G. Peterkin and became the mistress of Lang Syne Plantation. Her duties in that capacity and the rearing of a son occupied about 20 years of her life before she turned to writing. Her first book, *Green Thursday* (1924), consists of folk-tales of the South Carolina "gullah" Negroes, in dialect. *Black April* (1927), a novel, is largely composed of incidents in Mrs. Peterkin's plantation experiences. In 1928 her novel, *Scarlet Sister Mary*, won the Pulitzer Prize.

PETRIE, PÉTRI, SIR (WILLIAM MATTHEWS) FLINDERS (1853-). An English Egyptologist (see VOL. XVIII). He continued his excavations in Egypt till 1922, and was knighted in the next year. Among his later writings are *Amulets* (1914), *Helopolis* (1914); *Scarabs* (1917); *Tools and Weapons* (1917); *Eastern Exploration* (1919); *Some Sources of Human History* (1919); *Prehistoric Egypt* (1920); *Social Life in Ancient Egypt* (1923); *Lahun II* (1923); *History of Egypt, 1894-1923*; *Religious Life in Ancient Egypt* (1924); *Sediment I, II*, (1924); *Tombs of the Courtiers* (1924); *Buttons and Design Scarabs* (1925); *Ancient Weights* (1926); *Glass Stamps and Weights* (1926); *Descriptive Sociology of Ancient Egypt* (1926); and *Hill Figures of England* (1926). See ARCHÆOLOGY.

PETROLEUM. The tremendous development of the petroleum industry that took place in the 10-year interval from 1914 to 1924 was not projected into the 5-year period from 1924 to 1929 in equal proportion. Except for the tremendous increase in production during 1927, which amounted to about 17 per cent in the United States and slightly less than that for the world, the rate of output has been changed but little. The fundamental factor in holding production back, however, appears to have been the unsatisfactory marketing conditions engendered by overproduction.

The demand for petroleum and petroleum products has remained quite steady during the greater part of this period, but even the high

rate of consumption has failed to deplete the tremendous stocks of petroleum that have accumulated. Improvement in refining and production practices has served to reduce costs for individual operators, but at the same time it has served to increase the amount of effective overproduction.

Outside of the United States, Mexico continued as the principal producer until 1927, when it was superseded by Russia and Venezuela. Production in Russia has grown steadily since 1920, but in Venezuela the rate of growth may justly be considered as amazing. Venezuelan production, which first appears on the records in 1917 when it amounted to 120,000 barrels of 42 United States gallons, had increased to 64,400,000 barrels in 1927 and was even larger in 1928. Rumania's production, which had dropped from 13,555,000 barrels in 1913 to 3,721,000 barrels in 1917 and only amounted to 10,867,000 barrels in 1923, has shown remarkable growth since 1923, amounting to 30,600,000 barrels in 1928.

Colombia is another producer that has shown extraordinary growth in the past few years. In 1922 the production of petroleum from Colombia amounted to but 323,000 barrels, which had increased to 19,900,000 barrels by 1928. The world's production of petroleum, which was 858,909,000 barrels in 1922 and 1,015,727,000 in 1923, had increased to 1,252,145,000 barrels by 1927, and preliminary estimates for 1928 indicated an output of 1,322,896,000 barrels.

Of fundamental importance to the continued expansion of the petroleum industry has been the great increase in number of automotive vehicles (See MOTOR VEHICLES.) On Jan. 1, 1914, there were in operation in the United States 1,250,000 automobiles, which by the close of 1923 had increased to more than 15,250,000 and early in 1929 amounted to approximately 25,000,000. Great as has been the expansion in the petroleum industry, it has not been proportionately as great as that in the number of automobiles. The improvement in technical processes and, in particular, the evolution and development of the cracking processes, has served to increase the yield of naphtha from the crude oil to almost 300 per cent of that attained in 1913.

Important American Oil Fields. Though the production of oil in the United States comes from hundreds of pools scattered in many States, the number of pools with huge production records is relatively small. Records show that only a few oil fields in the United States have produced a total quantity of oil exceeding 100,000,000 barrels. Production record is held by the Midway-Sunset Field in California, which has yielded an enormous total of more than 600,000,000 barrels of oil in about 28 years, a record unapproached by any other field in the United States. Other important fields that have produced in excess of 250,000,000 barrels include Coalinga, Kern River, and Long Beach, Calif.; Cushing, Okla.; and Bradford, Pa.

The Salt Creek Field in Wyoming may ultimately reach 255,000,000 barrels, because of its deeper sands, which have not yet been developed but are known to contain a large volume of crude. The Smackover Field in Arkansas, from its several sands producing heavy and light oil has produced approximately 240,000,000 barrels and may ultimately reach 255,000,000 barrels, as the field is yet young. Other important fields

in the United States, in the approximate order of their importance, include the Glenn-Pool-Kiefer, Okla.; Santa Fe Springs, Calif.; Healdton and Burbank, Okla.; Santa Maria, Fullerton, and Huntington Beach, Calif.; Caddo, La.; Coyote, Calif., Humble, Tex.; Tonkawa, Okla.; Mexia, Powell, Spindletop, and Sour Lake, Tex., and the Seminole area of Oklahoma.

When an oil field is first brought into production, it is known as a "flush" field; that is, it usually has "flush" production derived from flowing wells, as distinguished from "settled" production from pumping wells of older fields. Production of oil in new flush fields usually increases rapidly after the discovery well is drilled in and quickly reaches an early peak from which the decline is rapid at first and then more gradual. Factors influencing the production of flush fields are the size of individual leases and the number of wells drilled. Under the system of competitive leasing and drilling, the owner of the first well usually endeavors to get all of the oil possible before it is taken by other owners drawing on the same pool of oil. In cases where a large block of land is held by one or comparatively few interests, the rapid development of a pool seldom occurs, because competitive pressure does not exist in such an aggravated form. The time element in a field's development also is affected by such factors as the size of the pool, whether large or small, whether extensions or new pools are found, or whether producing sands are found at different depths in the same field. Consult *Petroleum Facts and Figures*, published by the American Petroleum Institute.

Total United States production for 1928 was approximately 899,000,000 barrels, as compared with 901,129,000 barrels for 1927, or, in terms of daily average production, 2,461,000 barrels versus 2,470,000 barrels. In April, 1929, the daily production rate was around 2,650,000 barrels. The three major producing areas were Texas, Oklahoma, and California, Texas and California showing increased production rates in 1928, as compared with 1927, whereas Oklahoma showed a decline. New discoveries of greater or less importance occurred in nearly all districts in 1928.

Mexican Production. The rapid rise and fall of the production of petroleum in Mexico has been sensational. As early as 1901, there was a small oil production in Mexico, but it was not until 1910 that its production became a commercial factor. Within a few years, the output became second only to that of the United States. The two principal oil fields in Mexico are distinguished as the Northern and the Southern. The Southern field has been characterized as Mexico's "Golden Lane." From a negligible quantity in 1901, the production of petroleum in Mexico increased to 12,553,000 barrels in 1911, reaching a peak of 193,398,000 in 1921, and steadily declining thereafter until it fell below 100,000,000 in 1926 for the first time since 1919, and was less than 60,000,000 barrels in 1928. Adverse legislation has been an important factor in the declining rate of petroleum production in Mexico during recent years.

Persian Oil Fields. Persia is now the most productive oil area in Asia. The first wells were completed in 1908 and commercial production began about two years later. The principal producing areas are Maidan-i-Napthun,

now on an oil-burning basis. Of even more significance in its effect upon the petroleum and coal industries, the one favorably and the other unfavorably, was a similar conversion to an oil-burning basis of the merchant shipping of the world. Thus, before the War, of the world's total gross tonnage, amounting to 45,404,000 tons, probably less than 4 per cent burned oil. In 1920 the world's tonnage had increased to 53,905,000 tons, of which oil burners represented about 17 per cent. In 1926 the total tonnage was 64,784,000 tons, of which 20,827,000 tons or 32 per cent, were listed as oil burners. The American merchant marine has an oil-burning tonnage of 9,217,000 gross, the largest of any country. In 1914 its oil-burning gross tonnage amounted to only 656,000. Great Britain has an oil-burning gross tonnage of 6,064,000, and in 1914 its total was approximately 557,000 gross tons.

Most of the oil imported into the United States is of heavy quality, suitable for use chiefly as fuel oil, and much of it goes into marine use. Some is "topped," or refined, however, and an increasing gasoline recovery is being obtained by modern refining methods. The principle consuming agencies for fuel oil and gas oil are the merchant marine, the U. S. Navy, railroads using oil-burning locomotives, and public utility power plants and industries using oil burners under boilers, or equipped with Diesel engines for power purposes. Domestic heating with oil also is becoming of increasing importance. It has been estimated that the number of burners now installed in homes and apartment houses aggregates in excess of 1,000,000, each consuming an average of at least 50 barrels of oil per annum.

Public Aspects of the Industry in the United States. The year 1907 is memorable in the history of the oil industry because, during that year, the Standard Oil dissolution suit was started. The controlling ownership of the several Standard Oil companies has been widely dispersed since the dissolution decree was put into effect in 1911. No single factor has contributed so much to safeguard our country against the danger of a developing tendency to antagonism, as the easy transportation, the breaking down of the barriers of isolation, the facilitation of acquaintance and mutual understanding between city and country that have come with the age of petroleum, as leaders of the petroleum industry consider the past score of years. Perhaps no present-day industry is more characteristically American than that of petroleum. Over 70 per cent of the world's petroleum industry is in the United States. Among American industries, it rates second only to agriculture. From 1900 to 1925, petroleum production multiplied by 11.8. In that same period, pig iron multiplied by 2.67; bituminous coal by 2.4; copper by 2.7; steel by 2.4; lead by 2.4; and silver by 1.3.

There are no satisfactory data on the number of people in the petroleum industry; it has grown too fast, but it is estimated that there are more than 1,100,000 officials and employees. To this must be added operators of filling stations, of which the number is harder to estimate, but is placed conservatively around 225,000. Owing to constant improvements, the workers tend to grow fewer in proportion to output, though the number is growing steadily. The great number of investors and royalty owners

make the industry an exceptionally wide distributor of incomes.

Politically, the petroleum industry has received much public attention since relatively early in the Harding administration. Unfortunately, the essential facts have been obscured by the political aspects of the situation; nevertheless, public opinion has shown but little room for doubt that the entire situation involving former Secretary Fall, Edward L. Doheny, Harry F. Sinclair, and others was of a very unsavory character. The question of oil conservation likewise has been much discussed in recent years and on Dec. 19, 1924, President Coolidge constituted the Federal Oil Conservation Board, consisting of the Secretaries of War, Navy, Interior, and Commerce, to study the Government's responsibilities and to enlist the full co-operation of representatives of the oil industry in the investigation.

The Federal Oil Conservation Board issued questionnaires to the petroleum industry covering every phase of petroleum activity, and in February, May, and June, 1926, held public hearings at Washington, D. C., at which oil executives, technologists, and other representatives of the industry were heard. In September, 1926, the Federal Oil Conservation Board made public its preliminary report. At its annual meeting in December, 1926, the American Petroleum Institute approved the board's preliminary report and passed a resolution calling for the appointment of an institute committee to formulate and recommend a programme of legislation to be advocated giving sanction and effect to agreements by oil producers for the curtailment of production in pools where, and during periods when, there is overproduction, having for their purpose the economical and orderly production of oil.

At the suggestion of Chairman Work of the Federal Oil Conservation Board, a committee of nine was formed late in 1927 to study possible legislative steps designed to effect greater conservation of the country's natural petroleum resources. This committee comprised three representatives of the Government, three of the American Bar Association, and three of the petroleum industry. Early in 1929, it became apparent that international accord on the subject of oil conservation might be forthcoming and a meeting was held in New York in March, 1929, which was attended by representatives of the industry throughout the world. A tentative agreement was reached, whereby the rate of production in 1929 should be held down to the level that prevailed in 1928. The Government, however, refused to sanction this proposal, holding that it violated the anti-trust laws, leaving the entire question of oil conservation in at least as badly muddled a condition as ever.

Bibliography. *Petroleum Facts and Figures* (1928—second and revised edition, 1929), published by the American Petroleum Institute, is perhaps the most illuminating discourse on the petroleum industry available. The frequent reports of the U. S. Bureau of Mines and Department of Commerce, also the annual issues of *The Mineral Industry* afford considerable information, particularly on the statistics of petroleum. From time to time, the American Petroleum Institute in New York also publishes valuable bulletins and technical papers presented at its annual meetings. A most complete and useful work is *Handbook of the Petroleum Industry*, 2

vols., D. T. Day, editor (New York, 1922). Other recent volumes of value are V. R. Garfias, *Petroleum Resources of the World* (New York, 1923); L. C. Uren, *Petroleum Production Engineering* (New York, 1924); J. M. Macfarlane, *Fishes, The Source of Petroleum* (New York, 1923); Dorsey Hager, *Practical Oil Geology* (New York, 1919); id., *Oil Field Practice* (New York, 1921); R. H. Johnson, L. G. Huntley, and R. E. Sommers, *The Business of Oil Production* (New York, 1922); J. E. Pogue, *The Economics of Petroleum* (New York, 1921); Victor Ziegler, *Popular Oil Geology*, 2d ed. (New York, 1920); U. S. Geological Survey, *World Atlas of Commercial Geology*, part i, *Distribution of Mineral Production* (Washington, 1921); U. S. Bureau of Standards, *National Standard Petroleum Oil Tables, Circular No. 154* (Washington, 1924). See MEXICO; IRAQ; SAKHALIN; PERSIA; SHIP-BUILDING, *Oil Fuel*; CHEMISTRY, APPLIED; and GEOLOGY.

PETROVA, OLGA (Mrs. J. D. STUART) (1886-). An actress born in Warsaw, Poland, and educated at Paris, Brussels, and London. She began her theatrical career at the age of 20 in Shakespearean productions and later appeared in plays of Ibsen, Bernstein, and Strindberg. After making her American stage debut in New York City in 1911, she gave some time to motion pictures and appeared in *The Daughter of Destiny*; *The Orchid Lady*; *Bridges Burned*, and *More Truth than Poetry*, written by herself. She herself wrote *The White Peacock* and *The Hurricane*, in which she starred.

PETRUNKEVITCH, ALEXANDER (1875-). A Russian-American zoologist, born at Pliskin in Russia, and educated at the University of Moscow and at Freiburg. He was lecturer in zoology at Harvard (1903-04); acting professor (1906) at the University of Indiana; honorary curator of arachnida at the American Museum of Natural History (1909-11); and professor of zoology (since 1917) at Yale. He published: *Gedanken uber Vererbung* (1903); *Free Will* (1905); *Index Catalogue of Spiders of North Central and South America* (1911); *Terrestrial Palaeozoic Arachnida of North America* (1913); and *Morphology of Invertebrate Types* (1916).

HELPS, WILLIAM LYON (1865-). An American literary critic and university professor (see Vol. XVII). Continuing his work as Lampson professor at Yale, Dr. Phelps has conducted in *Scribner's Magazine* a department reflecting his views on books and current topics under the title, "As I Like It." He is also the author of *The Advance of the English Novel* (1916); *The Advance of English Poetry* (1918); *Archibald Marshall* (1918); *The Twentieth Century Theatre* (1918); *Reading the Bible* (1919); *Essays on Modern Dramatists* (1920-21); *Human Nature in the Bible* (1922); *Some Makers of American Literature* (1923); *Essays on American Authors* (1924); *Human Nature and the Gospel* (1925); *Adventures and Confessions* (1926); *Happiness* (1926); and *Love* (1928).

PHILADELPHIA. The third city in size of the United States. The population rose from 1,549,008 in 1910 to 1,823,779 in 1920 and to 2,064,200 in 1928, by estimate of the U. S. Bureau of the Census. In 1920 the municipal government was reorganized and a new city charter adopted. The bicameral council of 144 members was replaced by a small council of 21 members; a budget system was adopted; and model civil-service reforms were introduced, including

provisions for a civil-service commission of three persons. A city purchasing agent and a city architect also were appointed, and radical changes were made affecting city contracts. A zoning plan was adopted, dividing the city into residential, commercial, industrial, and unrestricted use districts, five height districts, and five area districts.

Much has been done since 1914 to improve the port, which in 1929 consisted of 267 wharves, 41 railroad piers, and 8 municipal piers. In 1915 the two Southwark piers were completed by the city as the first units of a scheme to give Philadelphia a municipally-owned water front of more than a mile. The complete development of the plan involved the construction of a series of piers, each connected with the belt line on Delaware Avenue, giving access to all the industries along the river; the total cost was estimated at \$24,000,000. This development also included the dredging of the Delaware River to the sea to a depth of 35 feet. In 1916 the Navy Department began the construction of a concrete drydock, 1064 feet long by 212 5 feet wide, which was completed in 1921; the drydock may be divided so as to dock one ship 670 feet long and another 330 feet long. During the World War, Congress appropriated \$62,000,000 for the construction at the shipyards at Hog Island of 120 vessels of 7500 tons and 60 vessels of 8800 tons capacity. In 1927, 12,086 vessels of 41,290,482 gross tons entered and cleared the port. In that year, the exports of 3,752,939 tons were valued at \$90,366,209 and the imports of 2,703,185 tons at \$204,801,132.

Between 1914 and 1924, 11 miles of elevated railroad were built from the Market Street elevated north and northeast, roughly parallel with the course of the Delaware River. An effort was made to make the line as noiseless as possible, the steel supports being partly filled with concrete to minimize their vibration and the rails laid in a roadbed of broken stone. In 1915 a \$6,000,000 bond issue was voted for the construction of a new subway system, which was to run north and south under Broad Street, crossing beneath the older subway at City Hall, and was planned to cost some \$46,000,000. Increasing costs caused by war-time conditions, however, forced postponement of construction, and the work was not resumed until 1923. In September, 1928, two tracks of this subway north from City Hall to Grange Avenue, a distance of about 6 miles, were opened to traffic. The line was temporarily operated by the Philadelphia Rapid Transit Company, pending the conclusion of negotiations toward a permanent agreement. The section between City Hall and South Street was still under construction but was expected to be in operation by April, 1930. The total cost of the work was approximately \$95,000,000.

The Delaware River suspension bridge between Philadelphia and Camden, N. J., was constructed between 1921 and 1926, the total cost of \$28,871,000 being borne by the two cities and by the States of Pennsylvania and New Jersey. See CAMDEN. In 1923 a bascule bridge over the Schuylkill River was built by the city under the direction of the Bureau of Surveys. In 1929 the completion of the Tacony-Palmyra Bridge over the Delaware River provided a second highway-toll bridge connecting Philadelphia and points on the New Jersey side of the river. The bridge is 2324 feet long and 38 feet wide and was erected at a cost of \$4,692,000. Between 1926 and 1929,

a 4800-ft. dam and power house were built near the mouth of the Susquehanna River by the Susquehanna Power Company, a subsidiary of the Philadelphia Electric Company. A total of 378,000 horse power in seven 54,000-horse-power units was to be installed in the power house. In 1925 the Pennsylvania Railroad entered into an agreement with the city, in accordance with which a new line, largely subway, was to be constructed between 15th Street and the Schuylkill River to replace the elevated structure and a new terminal was to be erected in West Philadelphia, after which the Broad Street Station was to be abandoned and the viaduct along Market Street removed.

A cultural centre is being developed on the new Parkway, created through the demolition of hundreds of old buildings, so that the city's centre might be directly linked by a grand boulevard with Fairmount Park. Two important units of this centre have been completed, the Art Museum and the Free Library. The Art Museum, which stands at the head of the Parkway, is built in the style of classical Greek structures. The stone used is a pinkish dolomite and the roof and cornices, together with a portion of the interior, are of glazed terra cotta. There are two exhibition floors with a floor space of about 168,000 square feet. The inaugural exhibition was held in March, 1928, the galleries completed comprising 10 period rooms devoted to the English and American sections and nine galleries of European schools. The cost of construction was approximately \$11,000,000. The new main building of the Free Library of Philadelphia is situated halfway between the City Hall and the Art Museum, on the Parkway. Indiana limestone was used in the construction of the exterior and artificial stone in the interior. Its shelves have a capacity for 1,750,000 volumes. When completely equipped, it will represent a total cost of approximately \$7,000,000. It was dedicated on June 2, 1927. A bequest to the city by the late Jules E. Mastbaum has made possible the construction of a reproduction of the famous Rodin Museum at Meudon, France, in which works of the French sculptor are housed. Plans for the further development of the Parkway as a cultural centre include the construction of a new \$1,000,000 home for the Franklin Institute, which will also house a museum of science and industry, and the construction of a new headquarters building for the American Philosophical Society. The Philadelphia Grand Opera Company was organized in 1927, and the erection of a grand opera house was contemplated in 1929. A municipal stadium was erected in 1925, and the Philadelphia airport was established in 1927. In 1926 the Sesqui-centennial Exposition was held in the south of the city adjoining the Navy Yard. It was open from June to December, but failed to arouse wide interest and was not financially successful.

In 1928 the census prepared by the director of attendance showed that there were 344,684 children of school age in Philadelphia. Of these 234,257 were enrolled in the public schools, 82,316 in the parochial schools, and 8401 in private schools; in addition, 7418 were employed but were attending continuation school. There were 205 public elementary schools, 4 schools of practice, 1 demonstration school, 1 industrial arts school, 1 trade and continuation school, 2 continuation schools, 16 junior high schools, 13 senior high schools, 1 normal school, 1 residential school. Since the inception of a \$57,500,000

building programme in 1921, 81 new buildings have been constructed and 60 unfit buildings eliminated, raising the sanitary rating of the school plants from 81.2 to 90.7 per cent.

In 1927, according to the census of the Pennsylvania State Department of Internal Affairs, 242,240 persons were employed by 5035 industrial establishments in Philadelphia and received \$315,249,800 in wages; the value of products manufactured was \$1,683,524,200. Philadelphia leads in the production of leather and tanned goods, knit goods, carpets and rugs, cigars and cigarettes, hats, saws, and files and is second in the refining of sugar and manufacture of woolen and worsted goods, confectionery and ice cream, chemicals and druggists' supplies, millinery, lace, and in dyeing and finishing textiles. The financial institutions of Philadelphia play an important part in the industrial development of the city, bank clearings in 1928 being \$29,377,000,000. Philadelphia is also the home of the Federal Reserve Bank of the third district. About 25 per cent of the building and loan associations in the United States are located in Philadelphia, these institutions number 3358 in 1928 with 1,189,867 members and assets of \$818,000,000. In 1927, 11,004 building permits representing a value of \$117,221,245 were issued. The assessed valuation of property in 1927 was \$4,454,559,000; the net debt was \$381,583,000.

PHILIPPINES. The largest island group of the Malay Archipelago, a possession of the United States since 1899. The population of the Philippines increased from 7,635,426 in 1903 to 10,314,310 in 1918. The estimated population in 1928 was 11,921,600. The population per square mile was 67 in 1903 and 104.2 in 1928. The population designated as Christian numbered 6,987,686 in 1903 and 9,381,357 in 1918. The non-Christian population, 647,740 and 932,953. The population in 1903 as regards sex included 3,496,652 males and 3,491,034 females; in 1918, there were 5,177,568 males and 5,136,742 females. By races the brown race numbered 6,914,880 in 1903, 9,386,826 in 1918; the yellow, 42,097 in 1903, 50,826 in 1918; white, 14,271 in 1903, 12,390 in 1918; the Negro, 1019 in 1903, 7623 in 1918. In 1903, 6,931,548 persons had attained Filipino citizenship and in 1918 the number had increased to 9,428,291. By religions, there were 6,559,998 Roman Catholics in 1903 and 7,790,937 in 1918. The Protestants in 1918 numbered 124,575, the Mohammedans 443,038; pagans, 508,596; Buddhists, 24,263, and all others, 5454. There are no earlier figures for these last classifications. The largest cities, with their populations, are as follows: Manila, 219,938 in 1903, 285,306 in 1918, estimated in 1926 at 336,500; Cebu, 31,079 in 1903, 65,502 in 1918, estimated 83,980 in 1929; Legaspi, formerly Albay, 14,049 in 1903, 52,756 in 1918, estimated at 32,372 in 1929; Iloilo, 19,054 in 1903, 49,114 in 1918, estimated at 65,248 in 1929; Lepa, 37,934 in 1903, 46,577 in 1918; San Carlos, 9974 in 1903, 42,453 in 1918. Other cities having a population of over 35,000 in 1929 were Zamboanga, estimated at 45,567; Laoag, estimated at 40,625.

Agriculture. In 1927 there were 9,900,000 acres of cultivated land, 13,100,000 acres of grass and open land, and 46,500,000 acres of forests in the Philippines. In the period after 1913, as in the previous years of American administration, vigorous and unremitting efforts were made to encourage and extend agriculture, which is the principal source of welfare of the islands and the chief

occupation of the people. The results accomplished were nothing short of remarkable. They were brought about by improving communications on land and sea; lowering freight rates; furnishing expert professional advice; encouraging the building up of agricultural schools; urging the youths of the country to devote themselves to agriculture; by continued efforts to eradicate epidemic diseases among horses, cattle, and carabaos; by vigorous campaigns against locusts; by the enactment of health legislation, and in various other ways. During recent years, the Department of Agriculture also encouraged the raising of poultry and the breeding of hogs, cattle, and other animals with a view to increasing the food supply. It encourages the breeding of carabaos, cattle, and horses for work purposes. Under the supervision of the bureau, a careful study was made with a view to prevention and control of rinder pest, a disease which every year carries off many thousands of carabaos. Rigorous regulations were applied against the importation of cattle from countries affected with rinder pest and other cattle diseases. The agricultural crops are often affected by drought and other disadvantageous conditions. Following the successful rice crop of 1913, the crop of 1914 was damaged by a great drought, which resulted in a decrease of 25 per cent in the production. Rice remains the main food crop although the substitution of corn as a food product has gradually made considerable headway. Figures for the chief crops for the period 1913-28 are given in the accompanying table.

for horses, cattle, swine, and poultry. The Plant Industry Division exercises supervision over plant and seed selection, tests fertilizers, and conducts exploration and investigation into various subjects connected with plant industry.

Mineral Production. The islands of the Philippines have important mineral resources. Deposits of gold, coal, petroleum, quicksilver, copper, and platinum exist, especially in the departments of Mindanao and Sulu. What apparently was one of the largest available unexploited iron deposits in the world is located on the Pacific coast in the Province of Surigao and extends from tidewater to the interior, perhaps to the adjacent Province of Agusan. Subsequent to 1913, the Bureau of Science did valuable work in the examination of mineral resources in the islands and there was a considerable development in mining. Gold is the only mineral produced in appreciable commercial quantities, the output increasing from 42,000 troy ounces in 1913 to 107,000 in 1928. A small amount of silver and iron is mined. Chromite has been found in Zambales. The total value of mineral production in 1927 was \$4,578,000. The chief nonmetallic products are coal, lime, mineral waters, salt, sand and gravel, and stone.

Manufactures. While the manufacturing development in the Philippines has not kept pace with agriculture and commercial development, there has been considerable progress as is indicated by the fact that the number of establishments increased from 3259 in 1903 to 8354 in 1918. With the exception of 37 sugar mills,

Crop	CROPS AREA, PRODUCTION, AND YIELD PER ACRE

† Production of raw sugar for seasons ended following year.

Manguey, tea, pineapples, citrus fruits, quinine, and camphor are other important products. The area devoted to rubber cultivation is increasing yearly, especially in the southern provinces. The acreage planted in 1928 was 6350 acres. Coconut products led all others in value of production and export in 1928, accounting for approximately one-third of the total trade. Progress of the live-stock industry is indicated in the accompanying table.

	1913	1916	1920	1928
Cattle	418,114	567,456	760,920	1,220,000

The veterinary division of the Department of Agriculture and Natural Resources performs valuable services by inoculating cattle against rinder pest. During 1920 over 10,000 animals were immunized. Several experiment stations are maintained in the islands, as well as breeding stations

6 coconut-oil mills, 7 desiccated-coconut factories, and three large cigar and cigarette factories, all manufacturing was carried on in small plants in 1929. The manufacture of sugar is the most important industry. Its rapid development may be shown by the fact that the value of the product in 1903 was \$3,301,500 and in 1918, \$41,072,981. Exports of sugar in various stages of manufacture in 1928 were valued at \$47,543,000, or 85 per cent of the total product. Coconut-oil works rank second in value of product, and had a remarkably rapid development, the exports increasing from a value of \$1,146,000 in 1903 to \$23,490,000 in 1928. Rice mills increased the value of their product and the abaca, or hemp-pressing, industry is also important. The product of cigar and cigarette factories increased in value from \$4,370,258 in 1903 to \$13,311,687 in 1918. In 1928 the output of cigar factories was 332,000,000, or 5 per cent greater than for 1927. The 1913 output was 282,000,000. Cigarette production increased from 4,385,000,000 in 1913 to 5,110,000,000 in 1928. Other important industries are lumbering, rope making, tailoring, boat-building, lithography, printing, and bookbinding.

The total amount of lumber cut for 1928 was 536,000,000 board feet, an increase of 10 per cent over 1927. Twenty-one new sawmills began operation during the year. The 1913 cut was 117,456,000 board feet. The manufacture of copra is of increasing importance. The production for 1928 was 1,168,000,000 pounds, as compared with 258,000,000 in 1913.

Transportation. The length of the railway lines in the islands increased from 681 miles in 1913 to 791 in 1927. In the latter year, they carried 9908 passengers and 1,893,000 tons of freight, the gross receipts being \$6,426,000. In the city of Manila, there were about 80 miles of electric railways which carried over 36,000,000 persons annually. The number of automobiles in the islands increased greatly; in 1928 there were 20,547 automobiles, 5510 trucks, and 2753 busses. The mileage of telephone wire was 38,340 in 1928. There were 19,850 instruments in use. Telegraph wires stretched 9789 miles.

Education. The development of education in the islands has been one of the chief concerns of the Government since the establishment of American rule, and the efforts have been extraordinarily successful. From the establishment of the Bureau of Education in 1900, a great public-school system has been developed in the islands. This achievement has been made possible only through persistent struggles against adverse conditions. Buildings and equipment had to be renewed and teachers had to be trained. The people in general had to be educated to appreciate the value of the public schools and their interest in them and their readiness to support them are in distinct contrast to the apathy which existed at the time the system was founded. Their change of attitude is an indication of an intellectual awakening exceptional in its speed and inclusiveness. At the time the bureau was established, there were over 1,000,000 children of school age in the islands and it was the aim of the bureau to bring 800,000 of these into the public schools at the earliest possible date. In 1913-14, the annual enrollment for the school year was 621,000. In 1928, 1,111,509 were enrolled in the public schools and 84,813 in the private schools.

The problem of teachers was a very serious one; at first, a large portion of the instructors in the schools were American, but the training of Filipino teachers at the Philippine Normal School, the Philippine School of Arts and Trades, the provincial secondary schools, the intermediate schools, and the University of the Philippines later met the need. There were, in 1925-26, 25,268 teachers. The number of male American teachers decreased from 268 in 1917-18 to 134 in 1921-22, while the male Filipino teachers increased from 8421 to 14,417. The number of female American teachers rose from 138 in 1917-18 to 231 in 1921-22; Filipino female teachers in 1917-18 numbered 4400 and in 1921-22 there were 9253.

Special forms of education, such as physical, agricultural, and industrial instruction, were successful from the beginning. In 1920, there were over 250 agricultural schools; 15 of these were classed as agricultural schools, 14 as farm schools, and 222 as settlement-farm schools. The famous Central Luzon Agricultural School at Munoz is said to be the best institution of its kind in the Orient. Improvement in the quality and quantity of the industrial work done in the public schools was steady.

Records attained by students of the public schools of the Philippines in the carnival inter-scholastic games and Far Eastern meets show conclusively that physical education also has received the closest attention. Instruction in civics, hygiene, and sanitation is given in the first six grades of the public schools. The spread of education among the non-Christian tribes has been a difficult problem. The purpose of the Bureau of Education has been to bring these people to the cultural level of their Christian brethren and at the same time to strengthen the bond of union between them and their Christian kinsmen. To bring about this result, a large number of Christian Filipino teachers were assigned in the period starting with 1913 to these provinces. In 1920, there were 1728 of these teachers. The insular expenditures for public schools in 1927 were \$4,331,500, compared with \$3,132,389 in 1913. In 1921-22 there were 371 public vocational schools in the islands. Of these, 338 were schools of agriculture, 23 were trade schools, and 7 were normal schools.

The University of the Philippines at Manila steadily increased in influence and importance. It is composed of the colleges of agriculture, education, engineering, liberal arts, law, medicine and surgery, veterinary science, junior college of liberal arts, and schools of dentistry and pharmacy. Also connected with the university is the conservatory of music, school of fine arts, school of forestry, school of nursing, and university high school. The total attendance in 1927-28 was 7078, compared with an enrollment of 1398 in 1913.

Trade and Commerce. The development of the general import and export trade of the islands for the period 1913-28 and the quantity and value of the principal Philippine exports in 1913 and 1928 are shown in accompanying tables:

VALUE OF FOREIGN TRADE IN MERCHANDISE

Calendar year	Thousands of dollars	
	General imports	General exports
1913	53,313	47,773
1914	48,589	48,690
1915	49,312	53,813
1916	45,496	69,937
1917	65,797	95,604
1918	98,599	135,194
1919	118,639	113,118
1920	149,438	151,124
1921	115,839	88,115
1922	80,198	95,583
1923	87,500	120,753
1924	108,011	135,345
1925	119,733	148,877
1926	119,299	136,884
1927	115,851	155,574
1928	134,657	155,055

The foreign trade of the Philippine Islands during the fiscal year ended June 30, 1929, amounted to \$315,446,256, or an increase of approximately \$5,000,000 over the previous year. Imports amounted to \$146,326,859, or an increase of approximately \$20,000,000 over the corresponding period in 1927-28, and exports, to \$169,119,397, or an increase of approximately \$24,000,000 over 1927-28. These figures were of interest in view of the fact that the prices obtained for the leading commodities were lower than in the previous year; while the sugar shipments, which were somewhat less than one-third of the total trade of the islands in 1929, reached a total of \$50,214,099, this being a slight increase over the value of the shipments for the previous year. Approxi-

EXPORTS OF PRINCIPAL PHILIPPINE COMMODITIES

* Not shown. ^b Not included in totals.

mately 58 per cent of the import trade and more than 75 per cent of the export trade of the Philippine Islands was with the United States in 1928-29. In 1913 the United States took only one-third of the Philippine exports and supplied one-half of the imports. The principal imports of the islands are cotton and its manufactures, agricultural implements, machinery and other non and steel products, and petroleum products. Cotton manufactures imported were valued at \$28,135,000 in 1928, \$23,043,000 in 1927, and \$11,844,000 in 1913. The value of iron and steel imports rose from \$5,243,000 in 1913 to \$11,481,000 in 1928; of machinery and parts, from \$5,924,000 in 1926 to \$10,853,000 in 1928; and of petroleum products, from \$1,813,000 in 1913 to \$8,668,000 in 1928.

Finance. Financial conditions in the islands suffered subsequent to 1914 from the disturbances created in general by the World War and also by local conditions. The Philippine National Bank, the largest financial institution of the islands (see *Banking*, below), suffered during 1920 as a result of an extension of its loans for the development of the industrial and commercial resources of the islands. This had an unfavorable result on the finances of the Territory. The general progress of financial administration will be noted from the fact that the receipts for the fiscal year 1913 amounted to \$13,489,700 and the expenditures to \$14,804,041. In 1920 the receipts amounted to \$45,452,889 and the expenditures to \$37,755,572. In 1927 total revenues were \$41,751,500 and total expenditures, \$42,095,000. The 1928 budget called for receipts of \$36,222,000 and expenditures of \$36,170,000. Returns for the first 11 months showed that receipts increased by \$6,300,000 and expenditures by \$3,325,000 over the corresponding period for 1927. The total bonded indebtedness on Dec. 31, 1927, was \$88,975,000 and the net debt was \$69,703,500, or \$5.50 per capita. Currency and coins

in circulation amounted to 127,446,000 pesos, or \$63,723,000.

Health and Sanitation. Perhaps the greatest problem faced by the American government in the Philippines was the spreading of ideas of modern sanitation among the people. For the most part, the average Filipino is born, lives, and dies without medical attendance or nursing. There is also great lack of hospitals and dispensaries. Although great progress was made in sanitation after 1913, there was later an increase in the number of preventable diseases, especially typhoid, malaria, beriberi, and tuberculosis. The death rate per 1000 in the islands was 16.817 in 1913; 18.553 in 1914; 35.467 in 1918; 19.385 in 1921; and 18.1 in 1928. As a result of intensive general vaccination, smallpox almost entirely disappeared from the islands. Cholera, however, continued more or less prevalent. There was an outbreak of considerable intensity in 1916. Typhoid fever caused many deaths, and systematic anti-typhoid vaccination carried on by the health service contributed much to the gradual diminution of this disease. An active educational campaign was carried on year after year by public conferences, lectures, demonstrations, pamphlets, and other measures. Leprosy, which is common in the islands, was greatly reduced by the administration of various esters of chaulmoogra. A leper colony is maintained at Culion, where about 6000 patients were under treatment in 1927. The colony, till then maintained by the Philippine Health Department, received subscriptions in 1928 to a fund of \$2,000,000, solicited in the United States by Governor General Leonard Wood just before his death. A school for sanitary inspectors was instituted, which included a six months' intensive training course for nurses.

Banking. The resources of the banks in the Philippines increased from 63,745,929 pesos (\$31,872,964) in 1913 to 431,405,077 (\$215,702,538) in 1920. In 1927 they amounted to 508,744,000 pesos (\$254,372,000). The Filipino National Bank was established in 1916 and by law was made the depository of all provincial and municipal governments. As the result of inefficient management, the bank suffered a series of losses in 1920 which reached a total of \$22,500,000. The American government, becoming alarmed at the situation, secured the services of an experienced banker from the United States under whose guidance the bank was placed on a sounder footing. A large part of the assets, however, had been loaned to concerns which for many years would be unable to repay them. These were chiefly sugar centrals and coconut-oil factories. The bank also established branches and agencies throughout the islands in charge of which were placed untrained Filipinos, and these branches, without exception, were mismanaged. These losses seriously involved the Philippine government. Twelve commercial or savings banks in the islands reported in June, 1927, total resources of \$127,186,000. Bank notes in circulation in 1928 totaled 30,678,000 pesos (\$15,339,000).

Government. The insular government is divided into the legislative, executive, and judicial branches. At the head of the executive branch, since the passage of the Organic Act of 1916, is the Governor General, who is appointed by the President, by and with the advice and consent of the Senate. He is assisted in the performance of his duties by the departmental secretaries. All

these, with the exception of the secretary of public instruction, who is also vice Governor General and is appointed by the President, were Filipinos in 1924. These officers are appointed by the Governor General. The other officials of the government, appointed by the President, are the auditor, the deputy auditor, and the nine justices of the Supreme Court. As regards provincial government, the Philippines are divided into 48 provinces, 36 of which are known as regularly organized provinces and the remaining 12 as specially organized provinces.

The chief executive of a province is the provincial governor, who in a regularly organized province is an elected official. He, together with the other two elected members, forms the provincial board which constitutes the legislative branch of the provincial government. In some of the specially organized provinces, the provincial governors are elected and other officials are appointed. There are in the Philippines 890 municipalities. The executive of a municipality is called a municipal president. The municipal council, which is the legislative branch of the municipal government, consists of from 8 to 19 councilors, depending on the size of the municipality. The Legislature is made up of the Senate and the House of Representatives. Of the 24 senators, only two are appointed by the Governor General. All the others are elected by popular vote. The 93 representatives also are elected, with the exception of nine, who are appointed. In August, 1928, the Council of State was established by executive order to form a connecting link between the executive and the legislative branches of the insular government. It is composed of the Governor General, as president, the presidents of both Houses of the Legislature, the leaders of the majority parties in both Houses, and the six secretaries of the major governmental departments.

Judiciary. The administration of justice is entrusted to the Supreme Court, the courts of first instance, the municipal court of the city of Manila, and the courts of justices of the peace. The Supreme Court is made up of nine justices, one of whom is chief justice. Decisions of the Supreme Court may be appealed to the United States Supreme Court in certain cases. In 1928 the latter voided an act to create a Board of Control to take control of much public property out of the Governor General's hands.

Political Events. The period commencing with 1913 included some of the most important events since the American occupation. From 1913 to 1916, the period was marked by political changes which had a marked influence on the later political history of the Territory. From 1907 to 1913, under the influence of the Philippine Commission, many constructive measures were passed and special emphasis was placed upon the improvement of education and the construction of permanent improvements. From 1913 to 1916, the restraining influence of the Commission was withdrawn by the appointment of a majority of Filipinos in that body.

In September, 1913, Francis Burton Harrison was appointed Governor General, succeeding W. Cameron Forbes. In conformity with his policy, President Wilson nominated a majority of Filipinos as members of the commission. Since the membership of the Lower House of the Philippine Assembly was already composed entirely of elected Filipinos, this placed the majority vote of the Filipino Legislature in the hands of the Filipino people. In 1914 the Legislature

passed many important measures, especially relating to finances. Governor Harrison carried on the policies of the Federal administration by appointment of an increasing number of Filipino heads of the executive branches of the government. During 1914 there occurred the so-called Ricarte movement. A man of this name, from a refuge in Hongkong, attempted to create an uprising among the more ignorant classes of persons in Manila and elsewhere. This was quelled without serious trouble.

In 1915 the greater part of the legislative sessions was devoted to consideration of financial reform and the economic development of the islands. During this year, there were practically no disturbances requiring the attention of the constabulary in any part of the islands. The year 1916 was signalized by the passage in Congress of a new Organic Act which was approved by President Wilson on Aug. 29, 1916, and which did away with the Philippine Commission and established a governor general as executive head and in addition, executive, legislative, and judiciary departments. The first session of the Philippine Legislature created by the bill convened in Manila on Oct. 16, 1916. For the first time in the history of the islands, the non-Christian tribes were represented in the legislative assembly.

In 1917 Congress passed no measures directly affecting the Philippines. The Immigration Act passed in that year applied to the islands but only until superseded by an act of the Philippine Legislature on the subject. The first election for senators in the Philippines was held in October, 1916, and at the meeting of the Legislature on October 16 of that year, the Philippine Commission ceased to exist. The session of the Legislature held in 1917 created a new budget system which was approved by the President. A currency act provided for the reduction of the bullion value of Philippine coins, when circumstances required, and made other provisions in relation to the currency.

The year 1919 was one of political activity and economic disturbance in the islands, as a result of conditions brought about by the end of the World War. The statements of the Allied leaders during and after the War in regard to the rights and liberties of small nationalities had been widely spread in the Philippines and led to a demand on the part of a strong political element for immediate independence. Immediately after the signing of the Armistice, the Filipino Legislature appointed a commission to the United States ostensibly for the purpose of establishing improved economic relations, but before its departure for the United States, the commission was instructed to present the case for immediate independence. The agitation for independence, while it continued much later, was less active after 1924. By 1920 all the branches of the government, except the Supreme Court, had been Filipinized.

Following the election of President Harding in 1921, Governor General Harrison resigned and was succeeded on October 15 of that year by General Leonard Wood, who, with W. Cameron Forbes, former Governor General, had been appointed as a special commissioner to the Philippines to examine the political and economic conditions. The commission arrived in Manila on May 4, 1921, and at once undertook a general survey of the government and conditions of the islands. Following General Wood's service as chairman of the commission, he was appointed,

in October, 1921, Governor General of the islands. General Wood and Mr. Forbes, in their report on the work of the commission, recommended that the present general status of the Philippines continue until the people had had time to absorb and thoroughly master the power already in their hands. They recommended also that the Governor General have authority commensurate with the responsibilities of his position. The report concluded as follows: "We recommend that under no circumstances should the American government permit to be established in the Philippine Islands a situation which will leave the United States in a position of responsibility without authority."

At the very outset of his administration, Governor General Wood found himself bitterly opposed by the aggressive advocates of independence. Controversy over appointments and other details of administration in 1922 resulted in a demand on the part of political leaders for Governor Wood's recall. The Legislature of 1921-22 provided for the issuance of bonds in the amount of \$5,000,000 for the purpose of protecting the financial interests of the government. Two parties, the Collectivista or Coalition Party, headed by Manuel Quezon and Señor Osmena, the two most powerful politicians in the islands, and the so-called Democratic Party, were the most important political organizations in the islands. The Collectivistas carried on, from 1921 onward, an aggressive campaign for independence and against the administration of General Wood. The Democratic Party took the more moderate position. The Collectivistas refused to cooperate with Governor General Wood. The Philippine Independence Commission, in November, 1923, appointed Manuel Roxas, speaker of the insular House of Representatives, commissioner to visit Washington and explain the Filipino side in the controversies with the Governor General.

A resolution introduced in Congress for an investigation of the administration of General Wood failed of passage. The Filipino Independence Commission, in January, 1924, presented to Congress a memorial denouncing the administration of General Wood and asking for the immediate independence of the islands. In March, 1924, Señor Roxas made a plea for independence to President Coolidge, who replied adversely.

Governor General Wood remained in office until his death in 1927, but was persistently opposed by the majority element in the Legislature. This opposition tended to hinder opportune legislation that might otherwise have passed without affecting the independence issue. A legislative measure to remove from the Governor General's control public property of a reported total value of \$70,000,000 and place it with a native Board of Control was voided by the United States Supreme Court. An issue was made of the American aides of the Governor General, whom the majority declared to be out of sympathy with Filipino views. An election of members of the Legislature, June 2, 1925, somewhat reduced the representation and standing of the Nationalist-Consolidated majority party. In 1926 President Coolidge sent Col. Carmi A. Thompson to the islands to report on conditions. Colonel Thompson, in his report, recommended that the granting of independence be postponed and that further autonomy be granted as circumstances might warrant. An act of the Philippine Legislature calling for a plebiscite on the issue of independence was vetoed by President Coolidge Apr. 6,

1927. In December, 1927, Henry L. Stimson was appointed Governor General, and undertook a conciliatory course with the legislative element. The Council of State, established in August, 1928, to form a connecting link between the executive and the legislative branches of the insular government, resulted in greater cooperation in the conduct of insular affairs. In March, 1929, Governor General Stimson resigned to become Secretary of State in President Hoover's cabinet and was succeeded by Dwight F. Davis, former Secretary of War, who continued the conciliatory policy. On Oct. 9 and 10, 1929, the United States Senate voted down two amendments to the Hawley tariff measure which would have granted immediate independence to the Philippines. The first was introduced by Senator King of Utah. The second, introduced by Senator Broussard of Louisiana, proposed an international conference to guarantee the independence of the islands and included a declaration that "the Government of the United States proposes to grant independence to the Philippines in the immediate future." The Senate also rejected Senator Broussard's proposal for duties on produce brought into the United States from the Philippines. While many Senators objected to the linking of Philippine independence with the tariff and voted against the two amendments on that ground, it was nevertheless felt that the vote indicated a majority sentiment adverse to the granting of immediate independence. The Broussard amendment was rejected by a vote of 63 to 19.

PHILLIPS, CHARLES (1880-). An American poet and playwright, born at New Richmond, Wis., and educated there and in Toronto. He had much experience as an editor. During the World War, he served overseas. Since 1924 he has been professor of English literature at the University of Notre Dame, Ind. Among his best books are *Back Home—An Old-Fashioned Poem* (5th ed., 1913); *The Divine Friend*, a poetic drama produced by Margaret Anglin in 1915; *Tarcisus*, a drama (1917); *A Buccaneer of Christ* (1918); *A Saint for Soldiers* (1918); *The New Poland* (London, 1923); *The Teachers' Year* (1924); *The Doctor's Wooing*, a novel (1926); *High in Her Tower*, verse (1927).

PHILLIPS, ULRICH BONNELL (1877-). An American historian and university professor, who was born at La Grange, Ga., and graduated at the University of Georgia. He held a fellowship in history at Columbia (Ph.D., 1902) and then for six years was instructor and assistant professor at the University of Wisconsin. He was professor of history and political science at Tulane University (1908-11) and since 1911 has held the chair of American history at the University of Michigan. In the World War, he served as captain, U. S. Army, Military Intelligence Division. In 1901 he received the Justin Winsor Prize of the American Historical Association. He is the author of *Georgia and State Rights* (1902); *History of Transportation in the Eastern Cotton Belt* (1908); *Life of Robert Tombs* (1913); *American Negro Slavery* (1918); and *Life and Labor in the Old South* (\$2500 prize for the best work on American history, 1928).

PHILLIPS, WILLIAM (1878-) An American diplomat, born at Beverley, Mass., and educated at Johns Hopkins University and the Harvard Law School. He was private secretary to the Ambassador to Great Britain from 1903 to 1905 and served in various capacities in the

State Department until 1908. He was appointed chief of the division of Far Eastern Affairs and then became first secretary of the American Embassy in London. He served again in the State Department and from 1917 to 1920 was Assistant Secretary of State. From the latter year to 1922, he was minister to the Netherlands and was appointed Under-Secretary of State in 1922. In 1924-27 he served as Minister to Belgium. During 1927-29 he served as U. S. Minister to Canada (the first to hold that office).

PHILLIPS UNIVERSITY. An institution of higher learning for men and women at University Station, Enid, Okla., founded in 1907. The student enrollment increased from 583 in the autumn term of 1923 to 879 in the autumn of 1928, the freshmen admission being limited to 270. The faculty during the same time was increased from 34 to 39; the productive funds from \$532,870 to \$548,830, and an endowment campaign completed in 1928 pledged \$1,252,184 for equipment. The library was increased from 10,000 to 16,537 volumes, exclusive of public documents. President, Isaac Newton McCash, A.M., D.D., LL.D.

PHILLPOTTS, EDEN (1862-). A British novelist and dramatist (see Vol. XVIII). His later novels include *The Judge's Chair* (1914); *The Girl and the Faun* (1916); *A Shadow Passes* (1918); *Orphan Dinah* (1920); *The Bronze Venus* (1921); *Redcliff* (1924); *Cyrc's Island* (1925); *The Jury* (1927); *Arachne* (1928); and *Tryphena* (1929). He also wrote the plays: *The Farmer's Wife* (1917), *St George and the Dragons* (1919), *Yellow Sands*, with Adelaide Eden Phillpotts (1926), *The Blue Comet* (1927), and *Three Short Plays* (1928); and the poems: *Plain Song*, *As the Wind Blows*, *Pixies' Plot*, *A Harvesting Man*, and *Brother Beast*.

PHILOLOGY, CLASSICAL. The World War, 1914-18, grievously interrupted the publication of periodicals and books, especially the former. Even in 1924, conditions in the book trade abroad were still unbalanced. It was hard to find out what was being published abroad, and far harder to obtain copies of books. The greatly increased prices of foreign books, especially of books published in Germany, made it difficult still in 1928-29, not only for individuals but also for libraries, to keep abreast even of the more important foreign publications.

In *The Nation* (New York), May 11, 1911, Prof. Paul Shorey, of the University of Chicago, in a paper entitled "American Scholarship" (reprinted in *The Classical Weekly*, vol. iv, pp. 226-230), supplied adequate proof that American classical scholarship need not fear comparison with the classical scholarship of Germany or England. At the semicentennial of the American Philological Association, in December, 1919, Professor Shorey returned to the subject, in a paper entitled "Fifty Years of Classical Studies in America." At the same meeting, Prof. F. G. Moore, of Columbia University, traced the history of the American Philological Association, and Prof. M. Bloomfield, of Johns Hopkins University, considered "Fifty Years of Comparative Philology in America." For these three papers, see *Transactions of the American Philological Association* (vol. I, pp. 5-83).

American classical scholarship has suffered grievous losses through the deaths of the following scholars (the name of the university with which the scholar was connected at the zenith of his career is given in parenthesis):

Frank Frost Abbott (Princeton), Charles E. Bennett (Cornell), Maurice Bloomfield (Johns Hopkins), John M. Burnam (Cincinnati), Basil Lanneau Gildersleeve (Johns Hopkins), William Gardner Hale (Chicago), Thomas D. Goodell (Yale), Francis W. Kelsey (Michigan), Tracy Peck (Yale), Bernadotte Perrin (Yale), Samuel Ball Platner (Western Reserve), Moses S. Slaughter (Wisconsin), Kirby Flower Smith (Johns Hopkins), James Rignall Wheeler (Columbia), and John Williams White (Harvard).

Professor Gildersleeve, whose death occurred on Jan. 9, 1924, was for 40 years editor of *The American Journal of Philology*. In the *New International Year Book* for 1921, p. 553, reference was made to the fact that vol. xl, no. 4, of that journal appeared on Oct. 3, 1921, the ninetyeth anniversary of the birth of Professor Gildersleeve, and that the whole volume was dedicated to him. The number mentioned contains the "Index Scoliodromicus," of 13 pages, which lists Professor Gildersleeve's extrasyntactical contributions to *The American Journal of Philology* and supplements the "Indiculus Syntacticus" (vol. xxvi, 1917), a bibliography of Professor Gildersleeve's long array of very valuable notes in the sphere of syntax, all published in the same periodical.

One of the most interesting developments since 1900 is to be seen in the efforts made, especially in England, America, and Germany, to bring a knowledge of the contents of classical works and their value to a wider array of readers. Of prime importance here is the *Loeb Classical Library*, whose aim is to present all the more important classical authors, Greek and Latin, with the ancient text on one page and an English translation opposite. Over 200 volumes of the *Library* have been issued. For general observations on the *Library*, see *The Classical Weekly* (vols. v and vi); for detailed discussions (by C. Knapp) of various volumes of the *Library*, see *The Classical Weekly* (vols. vii, xii, xiii, xv-xix, xxi, and xxii (1929)).

Another important movement in this field is represented by the series of volumes entitled *Our Debt to Greece and Rome*, published under the general editorship of Prof. G. D. Hadzsits, of the University of Pennsylvania, and Prof. D. M. Robinson, of The Johns Hopkins University. For the plan and the scope of the series, see *New International Year Book* for 1922 and 1923.

In Germany, a series of volumes whose purpose is to popularize the classics is *Das Erbe der Alten*. More scholarly, but still of interest to the general reader, are such works as *Einleitung in die Altertumswissenschaft*, under the general editorship of A. Geicke and E. Norden; *Die Hellenische Kultur* and *Die Hellenistische-Romische Kultur*, both edited by F. Baumgarten, F. Poland, and K. Wagner; and *Die Griechische und Lateinische Literatur und Sprache*.

Germany has long had an authoritative series of texts of the classical authors, both Greek and Latin—the famous *Teubner Series*. In the course of 30 years, by 1924, the Oxford University Press, in the *Oxford Classical Text Series*, had presented a fair array of texts of authors, Greek and Latin, edited by competent scholars, in most cases English. A very notable event is the establishment of several new series of classical texts. During the World War, 1914-18, Paravia & Co., Italian publishers, began a series entitled *Corpus Scriptorum Classicorum Paravi-*

anum (see *The Classical Weekly*, vols. xi, and xv; *New International Year Book*, 1918, p. 493). The *Corpus Paravianum* aims to show the manuscript text, with emendation only where the manuscript tradition gives no sense; otherwise, conjectural alterations proposed or accepted in other editions are not even to be mentioned.

About 1917 or 1918, French scholars began the publication of a series of texts of authors, Greek and Latin, under the patronage of the Association Guillaume Budé, which derives its name from Guillaume Budé, the great humanist of the French Renaissance, the founder of the Collège de France. In each instance, the text, with a brief critical apparatus, and a translation, in French, are given. Editions (with translations) of many authors, Greek and Latin, have been published. Under the head of "Literary and Historical Studies," the Association has published many works, such as *Histoire de la Littérature Latine Chrétienne*, by P. De Labriolle; *Introduction à L'Odysée*, by V. Bérard (see *The Classical Weekly*, vol. xix); and *Sénèque Prosauteur. Études Littéraires et Grammaticales sur la Prose de Sénèque le Philosophe*, M. A. Bourguery. The association has also published the first volume of a very important work, *Dix Années de Bibliographie Classique: Bibliographie Critique et Analytique de l'Antiquité Gréco-Latine pour la Période (1914-24)*; see *New International Year Book*, 1927, p. 635; 1928, p. 587.

In 1923 there was begun at Barcelona in Spain, under the auspices of the Fundació Bernat Metge, the publication of another series of this sort. It is known as *Col·lecció Catalana dels Clàssics Grecs i Latins* and gives new editions of the texts of classical authors, Greek and Latin, with translations in Catalanian. For a brief account of the series, by C. Knapp, see *The Classical Weekly*, vol. xix, pp. 151-152.

In Germany, certain monumental works had long been under way before 1914, whose aim was to make accessible what was known (or conjectured) in various fields of classical philology. The most ambitious efforts of this sort were the *Handbuch der Classischen Altertumswissenschaft*, and the classical encyclopedia known by the abbreviation, "Pauly-Wissowa." The *Handbuch* was begun under the editorship of Iwan von Müller. Since 1922 a thorough revision, under the direction of W. Otto, has been in progress. In the 50 years that had elapsed from the time the publication of the *Handbuch* was begun, the horizon of the classical scholar had been greatly widened, particularly through the discoveries connected with the so-called Minoan civilization. This extension of knowledge took scholars several millennia back of the point at which, six decades ago, classical civilization was supposed to begin. Scholars have gained also a far better understanding of the relation of the historic classical civilization to the civilization that preceded it, in the Mediterranean Basin, on the European side, in Egypt, and in Asia. Hence, in the revision of the *Handbuch*, new topics are being included, such as "Grundriss der Politischen Geschichte des Alten Orients," and "Kulturgeschichte des Alten Orients," to each of which a volume is to be devoted. The full title of the *Handbuch*, in view of this wider range of its subjects, has been altered to *Handbuch der Altertumswissenschaft*.

Pauly's *Real-Encyclopädie der Classischen Altertumswissenschaft* was begun so long ago as 1830 (see an article by C. Knapp, *The Classical*

Weekly, vol. xxi, pp. 216-217). A revision was begun in 1890, by G. Wissowa; the first part of this appeared in 1894. In 1924 the work was under the direction of W. Kroll and W. Witte. Between 1913 and 1924, four enormous volumes, viii-vi, carrying the first part of the encyclopedia forward from "Helikon" to "Kynegoi," were published. During 1925 volumes xii-xiii, and half of volume xiv appeared, these contain the articles "Kynesioi" to "Mantike." To facilitate the progress of the work, what is called a "Zweite Reihe" was begun in 1920. Three and a half volumes of this, covering the articles "Ra" to "Sparsus," have been issued. In 1918 appeared also *Supplementband III*, dealing with "Aachen" to "Ad Luglandem"; *Supplementband IV*, dealing with "Abacus" to "Ledon," with a "Nachtrag" entitled "Delphoi," was issued in 1924.

Another notable German undertaking, *Ausführliches Lexikon der Griechischen und Römischen Mythologie*, begun by W. H. Roscher, with the cooperation of many scholars, has been completed. The great *Thesaurus Linguae Latinae*, the most comprehensive and authoritative of all Latin lexicons, has been advanced; six volumes, carrying the work through the article "Frustum," were issued by the end of 1928. A further part appeared in 1929. In France, the *Dictionnaire des Antiquités Grecques et Romaines*, by Daremberg and Saglio, was completed.

A very notable event was the publication, by the Oxford University Press, of four installments (out of 10) of a new edition (ninth) of the great Greek-English Lexicon, compiled by Henry George Liddell and Robert Scott (8th ed., 1897). The work on the ninth edition was in charge of Henry Stuart Jones and Roderick McKenzie. It is, as the preface says, "the work of many hands and represents a great sacrifice of leisure and an earnest devotion to Greek learning on the part of the present generation of scholars, and that not in this country [England] alone." The preface gives an extraordinarily interesting account of the development of this edition, of the methods by which it was prepared, and of the participation by various scholars in its preparation. The Oxford University Press deserves the grateful thanks of all lovers of true learning for its daring courage and its generosity in undertaking, in this practical world, a project so exacting and so costly, not merely in money, but in human devotion and effort.

A significant movement in the United States is the attention paid to the classical element in English literature. Important studies here are *The Relation of Latin and English as Living Languages in England During the Age of Milton*, W. P. Myers; *The Influence of Horace on the Chief English Poets of the Nineteenth Century*, Mary R. Thayer; *Horace in the English Literature of the Eighteenth Century*, Caroline Goad; *Vergil and the English Poets*, Elizabeth Nitchie; *The Classical Mythology in Milton's English Poems*, C. G. Osgood; *Classical Mythology in Shakespeare*, R. K. Root; *Ovid and the Renaissance in Spain*, R. Schevill; *The Tradition of European Literature from Homer to Dante*, Barrett Wendell. For discussion of these works, see *The Classical Weekly* (vols. xii, xiv, and xvi). Many of the volumes in the series entitled *Our Debt to Greece and Rome*, mentioned above in this article, contain materials on this topic.

About 1918 steps were taken in America to concentrate support for a project that had been

under way for a long time in Europe. This movement sought to further the study of mediæval Latin by pointing out the indebtedness of the mediæval languages and mediæval culture to the language and the culture of ancient Rome. The European sponsors of the movement have undertaken a revision of Du Cange, *Glossarium Manuale ad Scriptores Mediæ et Infimæ Latinitatis*, a work which, though several times revised and enlarged since the death of its author, is still sadly defective. Since it is, however, the only work of value within its field, its revision and enlargement are conditions precedent to the successful prosecution of fully fruitful studies in mediæval Latin. Under stress of necessity, the authorities in charge of the revision of Du Cange have, most reluctantly, decided to restrict the revision to the collection of the requisite lexicographical materials from the Latin writings of 500 to 1000 A.D.

A Committee on Mediæval Latin Studies has been organized, under the jurisdiction of the American Council of Learned Societies, with representatives from associations dealing with classics, history, modern languages, and philosophy. A report of the committee was printed in *Modern Philology*, xxi (February, 1924). Prof. J. F. Willard, of the University of Colorado, has issued seven bulletins (1923-29) on the *Progress of Mediæval Studies in the United States of America*. Several volumes of selections from mediæval Latin writers, issued by American scholars, have done something to make instruction in mediæval Latin a little less difficult than it was; but well-annotated editions of whole works in this field are sorely needed.

In May, 1925, the Mediæval Academy of America was organized. It has published four volumes of its journal, *Speculum*, *A Journal of Mediæval Studies*. Further interesting illustrations of the results that may be expected from the impulse given to studies in mediæval Latin may be seen in such works as the translation of Walter Map, *De Nugis Curialium, or Courtiers' Trifles* (see *New International Year Book*, 1924, p. 578) and the translation of the complete *Chronicle, or the History of the Two Cities*, by Bishop Otto of Freising. This version, by C. C. Mierow (see *New International Year Book*, 1928, p. 587) is the first translation of the whole *Chronicle*.

Increasing attention has been paid to the papyri discovered from time to time, especially in Egypt. These have been studied for the light they throw on works of classical writers already known, by giving recensions of the ancient text hundreds of years older, in some instances, than the earliest manuscripts. They have been examined also for additions to the store of classical texts. Illustrations of the profits of such study are to be seen, for example, in these volumes: *Oxyrhynchus Papyri*, edited by the English scholars, Grenfell and Hunt (see, for instance, *The Classical Weekly*, vol. xiv, pp. 14-16; *Classical Review*, vol. xxiv, pp. 67, 179, *South Atlantic Quarterly*, April, 1914), and in such a book as *New Chapters in the History of Greek Literature, Recent Discoveries in Greek Poetry and Prose in the Fourth and Following Centuries B.C.*, by J. U. Powell and E. A. Barber.

A striking illustration of the value of the papyri in yet a third field, the study of Greek and of Roman life, is afforded by an important volume, "A Large Estate in Egypt in the Third Century B. C., A Study in Economic History," by

M. Rostovtzeff, published as *University of Wisconsin Studies in the Social Sciences and History*, No. 6. The author undertook to assemble into a complete picture the 350 papyri, or more, that give the correspondence of a Carian Greek named Zenon, manager of a great estate, of land originally unimproved, which Ptolemy II (Philadelphus) turned over to his Treasurer of Finance, a Greek named Apollonius. For a review of this book, by Prof. W. L. Westermann, of Columbia University, see *The Classical Weekly*, vol. xvi, pp. 110-112.

Through efforts organized by Prof. F. W. Kelsey, of the University of Michigan, various American universities have come into possession of papyrus documents. These have been studied by various scholars. In the *Transactions of the American Philological Association*, vol. liii (1922), are two articles, "Some Literary Papyri in the University of Michigan Collection," by Prof. J. G. Winter, of the University of Michigan, and "A Papyrus of Dioscurides in the University of Michigan Collection," by Prof. C. Bonner, of the same university. The latter gives part of a work entitled *De Materia Medica*, by Dioscurides of Anazarba. At the meeting of the American Philological Association at which these two papers were read, Prof. A. G. Laird, of the University of Wisconsin, presented a paper, "The Wisconsin Papyri," and Prof. A. E. R. Boak, of the University of Michigan, discussed "The Record Office of Tebtunis and Ceresuchon Oros." The last-named paper dealt with a register of contracts for a period of four months, Apr. 28 to Aug. 28, 42 A.D. In 1926 appeared the volume, *Greek Papyri in the Library of Cornell University*, edited, with translation, by W. L. Westermann and C. J. Kraemer, Jr. For a review of this work, by M. Rostovtzeff, see *The Classical Weekly*, vol. xxii (1929). It may be noted here that increasing use is being made of the papyri in the study of Egypt under the Greeks, that is, under the Ptolemies. Thus, a genuine history of the so-called Hellenistic world is finally becoming possible.

Prof. B. W. Bacon, of Yale University, writing in *The Classical Weekly* (vol. vi, pp. 213-214), declared "Until very recently, no manuscripts of first-rate critical importance had come into American hands." Later, however, classical manuscripts of importance found a resting place in the Morgan Library in New York City. One of these, a fragment of a manuscript of Pliny's *Letters*, has been decidedly in evidence since 1922. It had been bought by the late J. Pierpont Morgan in 1910. Dr. E. A. Lowe, a leading authority on classical palæography, and Prof. E. K. Rand, of Harvard University, published the fragment, in 1922, in a sumptuous monograph, well illustrated by plates, entitled, *A Sixth-Century Fragment of the Letters of Pliny the Younger, A Study of Six Leaves of the Uncial Manuscript Preserved in the Pierpont Morgan Library in New York*. Dr. Lowe believes that the fragment is a genuine relic of antiquity, and that it was written in Italy, about 500 A.D. Professor Rand believes that it is a part of a codex used by Aldus Manutius, in the preparation of his printed edition of Pliny's *Letters*. This codex, the *Codex Parisinus*, is now lost. In his views of the fragment, and of Aldus's edition of Pliny, Professor Rand is in sharp collision with Prof. E. T. Merrill, formerly of the University of Chicago, who, in 1922, published a critical edition of the text of Pliny's *Letters*. For reviews of the monograph by

Messrs. Lowe and Rand, see *Classical Journal*, vol. xviii; *Philologische Wochenschrift*, vol. xliii; *The American Journal of Philology*, vol. xlv; *Classical Review*, vol. xxxvii; *The Classical Weekly*, vol. xviii. Professor Merrill, in a paper entitled "The Morgan Fragment of Pliny's Letters," in *Classical Philology*, vol. xviii, takes issue with the views of Professor Rand. Professor Rand made an elaborate reply, in "A New Approach to the Text of Pliny's Letters," published in three parts, *Harvard Studies in Classical Philology*, vols. xxxiv (1923), xxxv (1924), and xxxvi (1925). For other articles inspired by this controversy, see, e.g., "On the 1508 Aldine Pliny," by Blanche B. Boyer and A. P. Dornjahn, *Classical Philology*, vol. xx; "Impressions of the 1508 Aldine Pliny," by F. E. Robbins, *Classical Philology*, vol. xxiii (1928); and "Another 1508 Aldine Pliny," by B. L. Ullman, *Classical Philology*, vol. xxiii.

On Dec. 19, 1906, Mr. Charles L. Freer, of Detroit, Mich., bought of an Arab dealer in Gizeh, near Cairo, four Biblical manuscripts. These were carefully studied by Prof. H. A. Sanders, of the University of Michigan. The results appear in the following volumes: "Old Testament Manuscripts in the Freer Collection, Part I, The Washington Manuscript of Deuteronomy and Joshua"; "The New Testament Manuscripts in the Freer Collection, Part I, The Washington Manuscript of the Four Gospels"; "The Old Testament Manuscripts in the Freer Collection, Part II, The Washington Manuscript of the Psalms"; "The Minor Prophets in the Freer Collection and the Berlin Fragment of Genesis," by H. A. Sanders and C. Schmidt, of the University of Berlin, published in 1910, 1912, 1917, and 1927, as parts of the *University of Michigan Studies, Humanistic Series*. For the importance of the manuscripts, see *The Classical Weekly*, vol. vi, p. 214.

In the field of palaeography, we must mention E. A. Lowe, *The Beneventan Script, A History of the South Italian Minuscule* (1914), a book which C. U. Clark, in a review in *The American Journal of Philology* (vol. xxv, pp. 340-343), described as "the most important recent palaeographic investigation in any language." A book on a kindred subject is *Roman Cursive Writing*, by H. B. Van Hoesen (1915).

The most important contributions made by American classical scholars in Greek and Latin literature, Greek and Roman history, Greek and Roman life, linguistics, and grammar appear in various periodicals. Books within this field include a very important volume by the late Prof. John Williams White, *The Scholia on the Aves of Aristophanes, with an Introduction on the Origin, Development, Transmission, and Extant Sources of the Old Greek Commentary on his Comedies* (1914). Professor White, of Harvard University, undertook to make a collation of all Aristophanic manuscripts. One outcome of the study was this volume of nearly 400 pages. For an elaborate review of the book, by G. E. Howes, see *The Classical Weekly*, vol. x, pp. 90-95. As a preliminary to that volume, Professor White, who died in 1917, had published *The Verse of Greek Comedy* (1912), reviewed by M. W. Humphreys (*The Classical Weekly*, vol. ix, pp. 141-144). In *Harvard Studies in Classical Philology*, vols. xxix, xxx (1918, 1919), there appeared two articles, "Collation of the Manuscripts of Aristophanes' *Aves*" and "Collation of the Manuscripts of Aristophanes' *Vespæ*," by J. W. White and E. Cary.

At least three American scholars have won distinction by their articles on Homer, published in various periodicals—G. M. Bolling, of Ohio State University; S. E. Bassett, of the University of Vermont; and J. A. Scott, of Northwestern University. Professor Scott has published two books on Homer, *The Unity of Homer* (1921) and *Homer and His Influence* (1925). Professor Bolling has issued *The External Evidence for Interpolation in Homer* (1926). For information on the general progress in Homeric studies, see the *New International Year Book*, 1921, p. 558.

Mr. Paul Elmer More, formerly literary editor of *The Nation* (New York), has published three volumes on Plato: *Platonism* (1917), *The Religion of Plato* (1921), and *Hellenistic Philosophies* (1923).

Works more general in character are *Athenian Tragedy, A Study in Popular Art*, by T. D. Goodell (1920), and *The Greek Theater and Its Drama*, by R. C. Flickinger (in three editions, 1916, 1922, 1926). Professor Flickinger's book is of prime importance in its field; for a notice of it, see *The Classical Weekly*, vol. xvii, p. 197. An important annotated edition of Cicero, "De Divinatione," the first published in the United States, by A. S. Pease, was published in the *University of Illinois Studies in Language and Literature*, vols. vi, viii (1920, 1923). Two biographies of Cicero by classical scholars appeared *Cicero of Arpinum, A Political and Literary Biography, Being a Contribution to the History of Ancient Civilization and a Guide to the Study of Cicero's Writings*, by E. G. Sihler (1914); *Cicero, a Biography*, by T. Peterson (1919).

Of great service to the student of Horace is *A Concordance to the Works of Horace*, by L. Cooper (1916). Professor Cooper has published also *A Concordance to Boethius* (1928) and, in conjunction with A. Gudeman, *A Bibliography of the Poetics of Aristotle* (1928). Prof. G. C. Piske, in *Lucilius and Horace, A Study in the Classical Theory of Imitation* (1920), examined again the whole question of the relation of Horace to Lucilius, his predecessor in satire. Prof. W. A. Merrill published many studies on Lucretius, dealing with his versification, imitations of his expressions by Vergil and other poets, etc. In 1918 he issued an edition of the text of Lucretius, complete (see *New International Year Book*, 1918, p. 492). Prof. Kirby Flower Smith, of The Johns Hopkins University, edited, with introduction and notes, the *Elegies of Tibullus*.

To Vergil, scholars of all countries have been giving much attention. In America, two biographies of Vergil appeared *Vergil, a Biography*, by Tenney Frank, of The Johns Hopkins University, and *Vergil's Biographical Literature*, by Norman W. DeWitt, University of Toronto (1923). Both authors assume that the poems of the so-called *Appendix Vergiliana* were practically all written by Vergil himself, in his youth, and that we may, therefore, confidently rely on them for important information concerning Vergil's earlier years. Both books abound with interesting and stimulating suggestions on individual points, but as wholes they are to be used only with great caution, especially since there is, as yet, nothing like agreement among scholars concerning the authorship of the pieces in the *Appendix Vergiliana*. At the close of the nineteenth cen-

tury, few scholars believed in their Vergilian authorship. F. Skutsch, however, in his *Aus Virgils Frühzeit* (1901, 1906), set the pendulum swinging, for a while, in the opposite direction. The tendency to accept one or more of the poems in the *Appendix* as Vergilian, as work of Vergil's youth, is seen in the following articles, or books: Miss E. S. Jackson, "The Authorship of the *Culex*," *Classical Quarterly*, vol. v; Th. Birt, *Jugendverse und Heimatpoesie Vergils, Erklärung des Catalepton* (1910: for reviews by N. W. De Witt and H. W. Prescott, see *The American Journal of Philology*, vol. xxxii, *Classical Philology*, vol. v); J. W. Mackail, "Virgil and Virgilianism, A Study of the Minor Poems Attributed to Virgil," *Classical Review*, vol. xlii, W. G. D. Butcher, "The Cæsura in Virgil and its Bearing on the Authenticity of the Pseudo-Virgiliana," *Classical Quarterly*, vol. viii; R. S. Conway, *The Youth of Vergil* (1915); J. S. Phillimore, "The Text of the *Culex*," *Classical Philology*, vol. v; T. Frank, "Vergil's Apprenticeship," *Classical Philology*, vol. xv; E. K. Rand, "Young Virgil's Poetry," *Harvard Studies in Classical Philology*, vol. xxx (1919); A. R. Bellinger, "Catullus and the *Ciris*," *Transactions of the American Philological Association*, vol. liii (1923).

Latterly, however, the view of those who would accept the pieces in the *Appendix* as Vergilian has been sharply challenged. Especially suggestive here is the work of R. S. Radford: "The Juvenile Works of Ovid and the Spondaic Period of his Art," *Transactions of the American Philological Association*, vol. li (1920); "The Priapeia and the Vergilian Appendix," *Transactions of the American Philological Association*, vol. lii (1921); "Tibullus and Ovid," *The American Journal of Philology*, vol. xlii (1923). Professor Radford believes that the whole Vergilian Appendix is the youthful work of Ovid, "composed by him in the period extending from 27 to 8 B.C." In the *Transactions of the American Philological Association*, vol. liii (1923), Prof. H. R. Fanclough, of Stanford University, in a paper entitled "The Poems of the *Appendix Vergiliana*," after study of the vocabulary of the poems in the *Appendix*, maintained that "probably not a single one of these poems has been correctly assigned to Vergil."

More general works in the field of Latin literature are E. G. Sihler, *From Augustus to Augustine, Essays and Studies Dealing with the Contact and Conflict of Classic Paganism and Christianity* (1923), and E. T. Merrill, *Essays in Early Christian History* (1924).

In the field of Greek history, we may note, first, G. W. Botsford and E. G. Sihler, *Hellenic Civilization* (see *New International Year Book*, 1915, p. 497). C. W. Blegen wrote *Korakou, A Prehistoric Settlement Near Corinth* (1921), published by the American School of Classical Studies at Athens. The civilization unearthed by excavations at Korakou, a hillock 3 kilometers west of the site of ancient Corinth, is of the type known as "Helladic," a term (see under ARCHAEOLOGY) devised to distinguish the prehistoric civilization of the Greek mainland from the prehistoric civilization found in the Cyclades Islands ("Cycladic") and in Crete ("Minoan"). Mr. Blegen's book deals with remains dating from 2500 to 1100 B.C. Important are works by M. Rostovtzeff, *Iranians and Greeks in South Russia* (1922), *The Ancient World*, vol. i, "The Orient and Greece" (1924).

Of *The Cambridge Ancient History* (see *New International Year Book*, 1923, p. 587), seven volumes of text and two volumes of plates have thus far appeared. Vol. iv (1926) deals with "The Persian Empire and the West," vol. v (1927) with "Athens, 478-401 B.C.," vol. vi (1927) with "Macedon, 401-301 B.C.," vol. vii with "Rome, Early Periods." See *The Classical Weekly*, vol. xxii, pp. 137-141.

Works on Roman history are the following: F. F. Abbott and A. C. Johnson, *Municipal Administration in the Roman Empire*; A. E. R. Boak, *A History of Rome to 565 A. D.*, (2d ed., 1929); T. Frank, *Roman Imperialism* (1914), *An Economic History of Rome to the End of the Republic* (2d ed., 1927) and *A History of Rome* (1923); Ida Thallon Hill, *Rome of the Kings*, Louise C. Holland, *The Faliscans in Prehistoric Times*; T. S. Jerome, *Aspects of the Study of Roman History* (1923), A. D. Randall-Mac Iver, *Villanovans and Early Etruscans* (1924), *The Etruscans* (1927), and *The Iron Age in Italy* (1927); M. Rostovtzeff, *The Ancient World*, vol. ii, "Rome" (1927), and *A Social and Economic History of the Roman Empire* (1926), G. Showerman, *Eternal Rome, The City and Its People From the Earliest Times to the Present Day* (1924).

In the field of Greek and Roman life, we can mention only W. S. Fox, *The Mythology of the Greeks and Romans* (1916, 1928), W. C. Greene, *The Achievement of Greece* (1923), W. W. Hyde, *Olympic Victor Monuments and Greek Athletic Art* (1921), reviewed by G. H. Chase, *The Classical Journal*, vol. xix, and D. M. Robinson, *The Classical Weekly*, vol. xvi, C. H. Moore, *The Religious Thought of the Greeks* (1916) and *Pagan Ideas of Immortality During the Early Roman Empire* (1918), E. Tavenner, *Studies in Magic from Latin Literature* (1916); L. Van Hook, *Greek Life and Thought* (1923).

In the field of Greek grammar, two important books are by H. W. Smyth, of Harvard University. *A Greek Grammar for Schools and Colleges*, (1916), and *A Greek Grammar for Colleges* (1920). The latter book is well worthy of a place beside the Greek Grammar of W. W. Goodwin, long the favorite Greek Grammar of Greek scholars and teachers in the United States and in England. Of prime authority in its field is A. T. Robertson, *A Grammar of the Greek New Testament in the Light of Historical Research*.

In the field of Latin grammar, quite the most impressive achievement in America since 1900 is the work of Prof. C. E. Bennett, *The Syntax of Early Latin*, vol. i, "The Verb" (1910), vol. ii, "The Cases" (1914). This work supersedes all previous discussions of the syntax of early Latin. For reviews by C. Knapp, see *The American Journal of Philology*, vols. xxxii, xxxv.

In linguistics, three American scholars are doing excellent work—L. Bloomfield, R. G. Kent, and E. H. Sturtevant. The work of all three is to be found largely in the periodicals. Professor Bloomfield has published a book, *An Introduction to the Study of Language*, Professor Kent a work entitled *Language and Philology*, and Professor Sturtevant two books, *Linguistic Change* and *The Pronunciation of Greek and Latin*.

In 1925 the Linguistic Society of America was formed; and in that year it began to issue a quarterly journal entitled *Language*.

In lexicography, foremost is the monumental work, *Lexicon Plautinum*, by Prof. G. Lodge, of Columbia University. Of this work, which has

been in course of publication since 1901, fifteen parts, totaling nearly 1400 large pages, have been issued: these carry the work into the article *Quidem*. Prof. M. N. Wetmore, of Williams College, published two important works, *Index Verborum Vergilianus* and *Index Verborum Catullianus*. For reviews of them, see *The Classical Weekly*, vol. vi. Professors W. A. Oldfather, A. S. Pease and H. V. Canter, of the University of Illinois, published "Index Verborum Quae in Senecae Fabulis Necnon in Octavia Prætexta Reperiuntur," in *University of Illinois Studies in Language and Literature*, vol. iv (1918). Professors A. A. Howard and C. N. Jackson, of Harvard University, published *Index Verborum C. Suetonii Tranquilli Stilique Proprietatum Nonnullarum* (1922).

PHILOLOGY, MODERN. In making this brief sketch of the progress of philology since 1914, it behooves us to stress, first of all, a few of the salient tendencies characterized by the vast volume of production in this ever-growing field of research. Thereafter, the most important languages, as viewed from the vantage point of intensity and originality of investigation, will claim our attention. To attempt to go further into detail is well-nigh impossible, considering space limitations. There shall even be no endeavor to list all the chief contributions made during this period, for such a classification would perforce be tentative and subject to the criticism of divergent opinion. It is necessary, therefore, that the selection be limited mainly to such technical works as indicate the direction in which investigations are being carried on. Hence, all titles in archaeology, anthropology, religion, literature, architecture, art, history, etc., are omitted notwithstanding the great value of many of these contributions to the growth and development of the study of modern philology.

The World War, which interrupted the period to which we are to devote our attention, had, from the philological point of view, two important consequences. On the one hand, it served to check, though not entirely, the outworn methods of investigation which had attained the zenith of their effectiveness before the close of the nineteenth century, while on the other, it made obvious to students of philology the vast possibilities that lay within their reach.

It was already noted in the pages of the 1914 *New International Year Book* that the study of philology was undergoing a process of transformation. The self-styled "back to nature" school, founded in the early nineties by German scholars under the leadership of Schuchardt, believed that they could arrive at general laws, applicable to all possible cases, by means of the study of dialects. Their preferred method, so aptly designed *Sprachmischung*, or the mutual penetration of dialects, failed to satisfy expectations, because of the numerous historical factors and variable accessory circumstances which must always be taken into consideration. The new French school, with Meillet at its head, hastened to reject entirely the esoteric philology which isolates linguistic facts from all contact with life, and began to interpret linguistics by the social movements of civilization—in a word, to seek in the development of languages the result of political and social actions.

Toward the close of the year 1915, there appeared the two-volume epitome entitled *La Science Française* issued under the auspices of the International Exposition at San Francisco. In

the second volume is to be found the very suggestive survey of linguistics by Antoine Meillet. According to this scholar, while there have been numerous German schools of philology, there has never been a French school for the mere reason that *savants* of that nationality have always drawn their conclusions from data, and have refrained from accepting any theory that was not entirely in harmony with facts. At the outset, French philologists sought to approach the subject from every angle in order to bring all possible light to bear upon it.

It is this, above all, which has led to the introduction of new fields of investigation, such as semantics, dialectology, phonetics, and kindred subjects. The results of these methods were not only the monumental *Atlas Linguistique de la France*, by Gillieron and Edmont—of which, according to Gaston Paris, French scholarship may well be proud—the *Sémantique* of Bréal, in which are laid the foundations of the science of the development of meanings of words, and the *Dissimilation Consonantique*, by Grammont, a work so original that further investigations were required to grasp its full significance, but also the *Histoire de la Langue Française*, by Brunot—which, says Jeanroy, has no equivalent in any other country—the great impulse given to experimental phonetics by the researches of Abbé Rousselot and others, the development along characteristic lines of the school of Celtic philology, and finally, the rehabilitation of the spoken language made by Meillet himself in his suggestive contributions to the study of Armenian, Slavic, and Greek. It is thus not so much by *des recherches de détail* (which, however, have their importance), as by the *introduction de vucs neuves et de directions originales* that comparative philology has received new vigor from French thought.

Following the lead of Meillet, one of the editors of the comprehensive *Atlas Linguistique de la France*, J. Gillieron, published a series of lectures entitled *La Paille de l'Étymologie Phonétique*, in which he opened the attack from a new quarter. As the title indicates, the learned author admits the inadequacy of the antiquated methods in vogue to cope with present-day problems.

The most striking feature of the year 1921 was the great revival of interest in the study of language and its attendant problems. It seems that many Europeans sought solace from the disillusionments of war in the inspiration furnished by President Wilson's theory of self-determination according to linguistic and racial unity. This has been a most vital and stirring problem with all of these peoples more or less from almost time immemorial.

Encouraged no doubt by this general tendency, Meillet returned to the investigation of fundamental problems of comparative linguistics. In a volume of essays entitled *Linguistique Historique et Linguistique Générale*, published in 1921, this scholar laid definitely the basic principles for the reconstitution of the methodology of this subject. In his opinion, all languages show common tendencies, determined, on the one hand, by the structure of the vocal organs and the limited number of phonetic possibilities that they offer, and, on the other, by the laws of general psychology. These tendencies are obvious in such universal changes as the weakening of intervocalic consonants, vowel-breaking, or in the normalization of para-

digs through the principle of analogy. "*Le changement linguistique*," says Meillet, "*est lié à des faits de civilisation et à l'état des sociétés qui emploient les langues considérées.*" In so far as it is a means of communication between the members of a same clan or of a same nation, language tends either to become infinitely differentiated or to fuse its divergent dialects into a common speech, according to the inclination to division or unification of the groups or peoples that speak it. The progress of language is inseparably bound up with the progress of society.

It is thus in extending our grasp of the great problem of linguistics that we are approaching more closely an understanding of the race, as well as the individual. However imperfect language may be as an expression of our thought, it nevertheless serves in its limited way to reveal our mental attitude. As a consequence of Meillet's investigations, the term philology now signifies much more than a mere juggling with forms: it is rather, to use the words of H. C. Wyld in his address, *English Philology in English Universities* (Oxford, 1921), "the study of human speech modified, altered, enriched at every stage by influences both literary and historical."

If we now turn to a more specific aspect of linguistics, i.e., grammar, we find that the same conditions obtain. In 1914 we noted that in regard to grammar there was a reaction against the study of the history of languages in favor of the general principles of the theory of language. O. Jespersen, *Modern English Grammar on Historical Principles* (Heidelberg, 1914), represents to a certain extent an effort to revive the teaching of grammar which, it may be said, had only slightly shown the effects of the progress of linguistics in the nineteenth century.

It was while making efforts to broaden and improve their methods in accordance with modern scientific research that scholars became aware that, like philosophy, theology, and medicine, the study of language was impeded on all sides by tradition and intolerance. From the more or less remote past, we have inherited a rigid methodology applicable to dead synthetic languages but totally inadequate to solve the problem of living analytic tongues and their relationship with a dynamic life teeming with new ideas. So, just as science was obliged to engage in open warfare with theology, modern philology entered the lists against its most redoubtable opponent, which is our antiquated, though universally accepted, conception of grammar and its laws.

Consequently, *La Pensée et la Langue*, by Ferdinand Brunot (Paris, 1922), dean of the University of Paris, is in many respects an epoch-making work. Bearing as a sub-title *Méthode, principes et plan d'une théorie nouvelle du langage appliqués au français*, this manifesto purports to be a "methodical statement of facts derived from thought and interpreted and classified in its relation to language, and of the means of expression corresponding to them." After showing how every innovation in linguistic methodology has sooner or later been thwarted by a heritage of mediæval grammatical concepts and nomenclature—even comparative philology was obliged to surrender many of its revolutionary doctrines when confronted by a glowing and tyrannical tradition—Brunot observes that, thanks to the efforts

of our "grammatical commissioners of police," the study of language today—like theology—is "a drudgery, the pet aversion of both pupils and teachers." Not even does orthographical reform escape the inquisition. Brunot, then, passes in review many gross blunders that the high priests of grammar dole out to the young as established facts, such as a tense which they interpret as a mood, a future-perfect disguised as a conditional, theories built upon misconstructions, etc. He adds, therefore, that it is high time to prepare a *Manual of Wrong Rules* as a pedagogical breviary which should protect the young against the "fundamentalism" of misguided dogmatists. Therefore, the object of Brunot's work is "the practical study of grammar with a view to enable the student to understand and express everything."

As a consequence of the rapid development of motion pictures, aviation, and radio, which are rendering geographical boundary an anachronism and are ameliorating international communication and good will, more widespread attention is rightly being devoted to comparative philology. Though only a century old, its influence in the cause of international understanding has been far-reaching. In past ages, each country had the utmost contempt for foreigners unable to speak its own tongue. To the ancient Hindus, such persons were *mlecchas* (Prakrit, *mlecchu*, Pāli, *mlakkhu*, barbarians, incomprehensibles, to the Jews, *gojim*, infidels, to the Arabs, *abscham*, babblers; to the Turks, *gacous* (Turkish *jawr*, *gawur*; Persian, *gaur*, another form of *gabr*, *guber*, infidels), unbelievers, miscreants, to the Greeks, *barbarophonto* or *barbaroi*, stammerers, and later uncultured, or barbarians. Even today, the French *charabia*, gibberish (Spanish, *algarabía*, the "Arabic language"), or *baragoun*, jaigon (Breton, *bara*, bread, and *goun* wine, offered to the French invaders of Brittany) or the Mexican, *gringo* (Spanish *gringo*, Greek), applied especially to the inhabitants of the United States, or the North American *wop* (Spanish *guapo*, handsome), or *dago* (Spanish-Portuguese, *Diego*, James, a term of address) have all now assumed a pejorative connotation and betoken the same spirit of contempt for the foreigner. But when comparative philology began to reveal that the so-called Indo-European languages were offshoots of the same parent stock, the alien tongue was no longer despised as the product of an inferior civilization. The finest compliment ever paid to a somewhat abstruse subject of research were the numerous efforts during the War to explain acts of aggression as a moral obligation to preserve continuity or relationship of speech.

The writer has often felt that the present period of the world's history will be designated in future times as the "dictionary epoch." In fact, never has such interest been shown in living foreign tongues. The vast number of dictionaries or vocabularies issued in the past fifteen years furnishes striking testimony to the desire of most nations to avoid cultural or commercial isolation. Likewise, the study of phonetics, which during the first half of its 40 years of history passed almost unnoticed, is now arousing widespread interest. In response to this great demand on the part of our public, several of our largest educational institutions are offering courses in this subject, as well as opportunities for research; and it may be added that the 10 distinguished foreign scholars, representing

France, Spain, and Italy, who lectured or taught in Columbia University in the summer of 1923, stressed the culture, civilization, and language of their respective countries. A final indication of the awakening of the spirit of international fraternization may be gathered from the recognition of the need of a universal tongue, which, since the decline of Latin in the seventeenth century, has been a mooted question with scholars. Now, the very urgent necessity of a common "radio language" is obvious to everyone and requires no further discussion here.

On Dec. 28, 1924, the Linguistic Society of America held its organization meeting in the Museum of Natural History in New York. Since its creation, this Society has been the guiding force in linguistic and philological thought in America. Among its numerous activities are the founding of a journal, *Language*, the publication of several monographs, and the inauguration of the first summer sessions devoted solely to the study of philology and its attendant problems, which were held at Yale University in 1928 and 1929 under the supervision of Professor E. H. Sturtevant.

A. Meillet and Marcel Cohen's *Les Langues du Monde* (Paris), which also appeared at the end of the year 1924, differs from the German *grundriss* type of work in that it does not consist of a collection of separate articles replete with philological minutiae and technical terminology. On the contrary, within the compass of less than 850 pages are condensed in non-technical language all of the essential facts pertaining to the numerous groups of languages of the world. That such a comprehensive work would contain lacunae was a foregone conclusion—such as, e.g., the omission of the Andaman group of languages, Katt, Zandawe, etc.—but aside from these defects, this volume can be recommended as without doubt the most comprehensive and, at the same time, succinct work on this vast and important subject which has yet been published.

The founding of the Medieval Academy of America at Harvard University in January, 1926, is also of significance to students of philology, because it aims to promote research in the literature and languages of the Middle Ages.

Finally, the completion in April, 1928, of Dr. J. A. H. Murray's *New English Dictionary on Historical Principles*, popularly known as the *Oxford English Dictionary*, marks the close of an important lexicographical epoch. Begun in 1857 by a committee of the Philological Society, which was appointed to list all words not to be found in existing dictionaries, this stupendous undertaking belongs, then, to the period when Littré and Hatzfeld and Darmesteter were issuing their monumental works in France, and the Grimm and other exhaustive lexicographies were either being planned or developed in Germany. In the *Oxford Dictionary*, one can, therefore, trace the progress of methodology in a phase of philology which has undergone much transformation in the past half-century or more.

The main tendency of philology at the present time (1929) is rather toward the investigation of concrete facts than toward general compilations which have been characteristic of the past. There is little doubt that the progress of this science will depend more and more on the evidence adduced from exhaustive and accurate interpretations of such phenomena. General

theories built upon insufficient data, such, e.g., as we behold in the works of modern anthropologists, are being gradually discarded. As a consequence, contributions of the type of Karl Vossler's *Geist und Kultur in der Sprache* (Heidelberg, 1925), admittedly a very stimulating philosophical interpretation derived from Crocean hypotheses, passed almost unnoticed.

Another interesting tendency is the eagerness with which philologists are availing themselves of the contributions of anthropology, archæology, and kindred sciences. Until recent years, each one of the above groups of scientists seemed to resent any coöperation from others in solving its special problems. It is therefore to be expected that many plausible theories evolved in the past are doomed, if not to utter annihilation, at least to considerable modification. See INTERNATIONAL LANGUAGE.

Bibliography. For further information, see the series of articles entitled "Philology, Modern," appearing in the *New International Year Book* from 1910 on.

Groth, *Kulturwandel und Bedeutungsandel* (Rudolstadt, 1926); R. G. Kent, *Textual Criticism of Inscriptions* (Phila., 1927); G. B. Sansom, *Historical Grammar of Japanese* (New York, 1928); M. Heepe, *Lautzeichen und Ihre Anwendung in Verschiedenen Sprachgebieten* (Berlin, 1928).

Indo-European.—Works on the language of the primitive Indo-Europeans are devoted mainly to phonology and morphology. Among the more important are H. Hirt, *Fragen des Vokalismus und der Stammbildung in Indogermanischen* (Strasbourg, 1914); K. Brugmann and B. Delbrück, *Grundriss der Vergleichenden Grammatik der Indogermanischen Sprachen* (2d ed., Strasbourg, 1916); O. Schrader, *Reallexikon der Indogermanischen Altertumskunde* (2d ed., ib., 1917); H. Guntert, *Indogermanische Ablautprobleme* (ib., 1916); W. Streitberg, *Erforschung der Indogermanischen Sprachen* (Stras-

bourg, 1916); S. Feist, *Indogermanen und Germanen* (3d ed., Halle, 1925); C. Bartholomae, *Zur Etymologie und Wortbildung der Indogermanischen Sprachen* (Heidelberg, 1919); H. Hirt, *Indogermanische Grammatik* (Pt. II, Heidelberg, 1921); H. H. Bender, *The Home of the Indo-Europeans* (Princeton, 1922); A. Meillet, *Les Origines Indo-Européennes des Mètres Grecs* (Paris, 1923); K. Brugmann, *Die Syntax des Einfachen Satzes in Indogermanischen* (Berlin, 1925); F. Ewald, *Die Entwicklung des K-Suffixes in den Indogermanischen Sprachen* (Heidelberg, 1924); E. Schwegler, *Die Primären Interjektionen in den indogermanischen Sprachen* (ib., 1925); C. Antran, *Sumérien et Indo-Européen* (Paris, 1926); C. S. Baldwin, *Medieval Rhetoric and Poetic (to 1500)* (New York, 1928).

Indo-Iranian.—Contributions to this field were less numerous. They consist principally of translations and grammatical and syntactical studies of texts. Somewhat out of the ordinary are Jouveau-Dubreuil, *Archéologie du Sud de l'Inde* (2 vols., Paris, 1914); C. Bartholomae, *Zur Kenntnis der Mitteliranischen Mundarten* (Heidelberg, 1917); H. Oldenberg, *Zur Geschichte der Altindischen Prosa* (Berlin, 1917); Sir G. A. Grierson, *Linguistic Survey of India* (vol. x, Calcutta, 1921) containing specimens of languages of the Iranian family; A. Carnoy, *Grammaire Élémentaire de la langue sanscrite* (Paris, 1925); A. B. Keith, *The Religion and Philosophy of the Veda and Upanishads* (2 vols., Cambridge, Mass., 1926); A. A. MacDonell, *India's Past* (New York, 1927); C. Huart, *Ancient Persia and Iranian Civilization* (ib.); and A. V. Williams Jackson, *Zoroastrian Studies* (New York, 1928).

Slavic.—Among the numerous contributions, we may note Berneker, *Slavisches Etymologisches Wörterbuch* (Heidelberg); Vondrák, *Altarchaislavische Grammatik* (2d ed., Berlin, 1914); J. Herzer, *Bohmisch-deutsches Wörterbuch* (Prague); R. J. Kerner, *Slavic Europe* (Cambridge, Mass., 1918), a bibliography; H. H. Bender, *Lithuanian Etymological Index* (Princeton, 1922); L. Nièderlé, *Manuel de l'Antiquité Slave* (Paris, 1923); and L. Teisnière, *Les Formes du Duel en Slovène* (Paris, 1925). Other studies include Slovenian, Ruthenian-Ukrainian, Russian, Czech (see *New International Year Book*, 1916, 1918, 1919, etc., eg.); Baltic (1915, p. 499; 1920, p. 537; 1922, p. 563); Serbo-Croatian (1918, p. 495; 1915, p. 499); Serbian (1916, p. 537); Polish (1918, p. 495, 1916, p. 537); Ukrainian (1917, p. 537; 1918, p. 495); Lithuanian (1918, p. 495; 1920, p. 537; 1922, p. 563); Old Prussian (1918); Bulgarian (1919).

Celtic.—Studies in Irish, Manx, Scotch, Welsh, Cornish, and Breton, as well as Gaulish and Pre-Celtic, have appeared more or less every year. Among the more important are C. Julhan, *Histoire de la Gaule* (4th vol., Paris, 1914); G. Dottin, *Manuel pour Servir à l'Étude de l'Antiquité Celtique* (Paris, 1915); John Strachan and J. G. O'Keeffe's edition of the *Táin Bó Cuáingne* (Dublin, 1916); *Catalogue of the Bradshaw Collection of Irish Books in the University Library of Cambridge*, 3 vols. (1916); K. Meyer, *Zur Keltischen Wortkunde* (Berlin, 1917-19); E. Cartailhac, *Dictionnaire Archéologique de la Gaule* (vol. ii, Paris, 1919); G. Dottin, *La Langue Gauloise* (ib., 1920); J. Loth, *Remarques et Additions à la Grammaire*

Galloise Historique et Comparée de John Morris Jones (Paris, 1920); E. Le Blant, *Inscriptions Chrésiennes de la Gaule* (2 vols., Paris, 1923); J. D. Bruce, *The Evolution of Arthurian Romance from the Beginnings Down to the Year 1800* (Baltimore, 1923); S. H. O'Grady, *Catalogue of Irish Manuscripts in the British Museum* (London, 1926); A. H. Krappe, *Balor with the Evil Eye* (New York, 1927); Sir J. Wilson, *The Dialects of Central Scotland* (New York, 1927); J. Baudiš, *Grammar of Early Welsh* (London, 1927); R. S. Loomis, *Celtic Myth and Arthurian Romance* (New York, 1927); T. M. Chotzen, *Recherches sur la Poésie de Dafydd ab Iwilym* (Paris, 1927); and W. B. Johnson, *Folk Tales of Brittany* (New York, 1928).

Germanic.—Contributions to the Germanic languages also are numerous. Among them are J. Hoops, *Reallexikon der Germanischen Altertumskunde* (Berlin, 1915-19); Grimm's *Deutsches Wörterbuch* (Leipzig); H. Fischer, *Schwabisches Wörterbuch* (Tübingen); Jellinghaus-Forstemann, *Aldeutsches Namenbuch* (Bonn); the *Schweizerisches Idiotikon, Wörterbuch der Schweizer-deutschen Sprache* (Frauenfeld); J. Zupitza, *Einführung in das Studium des Mittelhochdeutschen* (Chemnitz, 1916); J. Schatz, *Altbaurische Grammatik* (Göttingen, 1915); A. Meillet, *Caractères Généraux des Langues Germaniques* (Paris, 1917); B. Delbrück, *Germanische Syntax* (Leipzig, 1916-19); H. Paul, *Deutsche Grammatik* (4 vols., Halle, 1916-20); E. Sievers, *Metrische Studien* (Leipzig, 1919); S. Feist, *Etymologisches Wörterbuch der Gotischen Sprache* (Halle, 1920); H. Hirt, *Geschichte der Deutschen Sprache* (Munich, 2d ed., 1926); F. Kluge, *Deutsche Sprachgeschichte* (Leipzig, 1925); O. Behaghel, *Deutsche Syntax* (Heidelberg, 1923); A. Pinloche, *Etymologisches Wörterbuch der Deutschen Sprache* (Paris, 1923); and W. Schulze, *Die reduplizierten Präterita des Tocharischen und des Germanischen* (Berlin, 1924); J. Feldman, *Ortsnamen* (Halle, 1925); H. Jellinghaus, *Geschichte der Mittel-niederdeutschen Literatur* (3d ed., Berlin, 1926); E. Oechs, *Bairisches Wörterbuch* (Lahr, 1926); J. Müller, *Rheinisches Wörterbuch* (Bonn, 1926-); O. Mensing, *Schleswig-holsteinisches Wörterbuch* (Neumünster, 1926-); W. Stormfels, *Etymologisches Lexikon Deutscher und Fremdländischer Ortsnamen* (Berlin, 1926); A. Heintze and P. Cascorbi, *Die deutschen Familiennamen* (6th ed., Halle, 1926); F. W. J. Heuser and H. G. Wendt, *American Bibliography of Germanic Languages and Literatures* (cf. *Germanic Review*, New York, 1927).

Scandinavian.—This group of scholars made useful contributions to Old Norse, Icelandic, Swedish, Danish, Norwegian, etc., such as the Swedish Academy's *Ordbok öfver svenska Språket* (Lund); Egilsson and Jónsson, *Lexicon Poeticum Antiquae Linguae Septentrionalis* (Copenhagen); A. Torp, *Nynorsk Etymologisk Ordbok* (Christiania); Klara Stroebe, *Nordische Volksmärchen*, edited by F. von der Leyen and P. Zaunert (2 vols., Jena, 1915); W. A. Craigie, *The Icelandic Sagas* (New York, 1915); A. Kock, *Svensk Ljudhistoria* (Lund); O. Oestergren, *Nusvensk Ordbok* (Stockholm); E. Hellquist, *Svensk Etymologisk Ordbok* (Lund); H. Hermannson, *Bibliography of the Eddas* (Ithaca, 1920); V. Dahlerup, *Det Danske Sprogshistorie* (Copenhagen, 1921); J. Jakobsen, *Etymologisk Ordbok over det Norrone Sprog pa*

Shetland (4 vols., Copenhagen, 1908-21); V. Dahlerup, *Ordbog over det Danske Sprog* (vol. vi, Copenhagen, 1925); E. Sievers, *Die Edda Lieder* (Leipzig, 1923); J. Sahlgren, *Nordiska Ortnam i språklig och saklig belysning* (Lund, 1925); S. Blöndel, *Islandsdansk Ordbog* (Copenhagen, 1925); P. A. Munch and M. Olsen, *Norse Mythology* (New York, 1927); and E. V. Gordon, *Introduction to Old Norse* (ib.).

English.—As no selected list of works could do justice to such an extensive field of research, we will limit our attention to Dr. Murray's *New English Dictionary* (Oxford); H. Harrison, *Surnames of the United Kingdom* (London); H. L. Mencken, *The American Language* (New York, 1919); P. G. Thomas, *Introduction to the History of the English Language* (London, 1920); H. C. Wyld, *History of Modern Colloquial English* (ib., 1920); K. Luick, *Historische Grammatik der Englischen Sprache* (Leipzig); E. Weekley, *Etymological Dictionary of Modern English* (London, 1921); T. N. Toller, *Anglo-Saxon Dictionary* (Oxford, 1922); R. Huchon, *Histoire de la Langue Anglaise* (Paris, 1923); A. C. Paves, *Annual Bibliography of English Language and Literature* (Cambridge); S. Lee, F. S. Boas, and C. H. Heiford, *The Year's Work in English Studies* (Oxford, and London, 1925-1928); B. Borowski, *Lautdubletten im Altenglischen* (Halle, 1924); R. Jordan, *Handbuch der mittelhochdeutschen Grammatik* (Heidelberg, 1925); G. P. Krapp, *The English Language in America* (New Haven, Conn., 1926); J. and E. N. Wright, *Old English Grammar* (London, 1926); O. Barfield, *History in English Words* (New York, 1926); E. Weekley, *Words Ancient and Modern* (ib.); A. G. Kennedy, *Bibliography of Writings on the English Language* (New Haven, Conn., 1927); W. A. Craigie, *The Study of American English* (New York, 1927); H. C. Wyld, *Short History of English* (New York, 1928); G. H. McKnight, *Modern English in the Making* (ib.); O. Jespersen, *Modern English Grammar* (London, 1928); Margaret P. McLean, *Good American Speech* (New York, 1928); M. H. Wesen, *Crowell's Dictionary of English Grammar* (ib.); W. W. Lawrence, *Beowulf, an Epic Tradition* (Cambridge, Mass., 1928).

Romance.—The continued activity of scholars in this domain bespeaks the immense wealth of material at the disposal of the philologist. As examples may be cited Meyer-Lübke, *Romanisches Etymologisches Wörterbuch* (Heidelberg); and J. Bédier's *Légendes Épiques* (Paris, 2d ed., 1922). Other works are G. Nicholson, *Recherches Étymologiques Romanes* (Paris, 1921); E. Bourciez, *Éléments de Linguistique Romane* (ib., 1923); G. Millardet, *Linguistique et Dialectologie Romanes* (ib., 1923); D. S. Blondheim, *Les Parlers judéoromans et la "Vetus Latina"* (Paris, 1925); Pauline Taylor, *Romance Linguistics in 1925, 1926, 1927* (cf. *Romance Review*, New York, xvii, 175-188; xviii, 278-291; 366-380; xix, 366-378, etc.); A. Zauner, *Romanische Sprachwissenschaft* (Berlin, 1926); R. M. Merrill, *List of American Doctoral Dissertations in the Romance Field, 1876-1926* (New York, 1927); W. Meyer-Lübke, *Introducción a la Linguística Románica* (Madrid, 1928).

French.—K. Nyrop, *Grammaire Historique de la Langue Française* (3d ed., Copenhagen, 1925); A. Tobler, *Altfranzösisches Wörterbuch*, edited by E. Lommatzsch (Berlin); A. Haase, *Syntaxe Française du Dix-septième Siècle* (trans. by M. Obert, Paris, 1916); F. Brunot,

Histoire de la Langue Française des Origines à 1900 (vol. vii, Paris, 1926); K. Vossler, *Fransösische Philologie* (Gotha, 1919); L. Gauchat, J. Jeanjaquet, E. Tappolet, E. Muret, *Glossaire des Patois de la Suisse Romande* (vol. ii, 1920); J. Gilléron, *Étude de Géographie Linguistique* and supplement to vol. i of the *Atlas Linguistique de la France* (Paris, 1921); A. Longnon, *Les Noms de Lieux de la France* (Paris, 1920-25); P. Barbier, *English Influence in the French Vocabulary* (New York, 1922); W. von Wartburg, *Französisches Etymologisches Wörterbuch* (Bonn, 1925); J. Vising, *Anglo-Norman Language and Literature* (Oxford, 1923); P. Désormaux, *Bibliographie Méthodique des Parlers de Savoie* (Paris, 1923); L. Sainéan, *Les Sources indigènes de l'étymologie française* (2 vols., Paris, 1925); K. Voretzsch, *Einführung in das Studium der altfranzösischen Literatur* (Halle, 1925); E. Huguet, *Dictionnaire de la langue française du seizième siècle* (Paris, 1925); M. Frey, *Les Transformations du vocabulaire français à l'époque de la Révolution (1789-1800)* (Paris, 1925); J. Waslet, *Vocabulaire Wallon-français* (Sedan, 1925); C. Bally, *Le Langage et la vie* (Paris, 1926); E. Gamillscheg, *Französisches etymologisches Wörterbuch* (Halle, 1926-); K. Voretzsch, *Einführung in das Studium der altfranzösischen Literatur* (Halle, 1926); J. Bédier, *La Chanson de Roland* (Paris, 1927); H. Bauche, *Le Langage populaire* (Paris, 1928); H. Langlaid, *La Liaison dans le français* (ib.); H. Sensitive, *L'Emploi des temps dans le français* (2d ed., ib.).

Italian.—Dialectology and lexicography have held the attention of Italian scholars. Among these works are G. Berton, *Italia Dialectale* (Milan, 1916); E. Monaci, *Studi Romanzi* (Rome, 1917); L. Spitzer, *Italienische Umgangssprache* (Bonn, 1925); G. Saccà, *La Lingua Italiana e la sua Evoluzione* (Catania, 1923); T. Labaude-Jeanroy, *La Question de la langue en Italie* (Strasbourg, 1925); R. R. Bezzola, *Abbozzo di una storia dei gallicismi italiani nei primi secoli (750-1300)* (Heidelberg, 1925); G. Berton and M. G. Bertoli, *Breviario di neologismica* (Modena, 1926); V. Uaiagi, *Fonologia sarda logudorese e campidanese* (Palermo, 1926); F. Cocola, *Vocabolario dialettale biscegliese-italiano* (Trani, 1926); C. H. Grandgent, *From Latin to Italian* (Cambridge, Mass., 1927); *Studi di Filologia italiana* (Florence, 1927); and L. Valli, *Il linguaggio segreto di Dante e dei "Fideli d'Amore"* (Rome, 1928).

Spanish.—The numerous dialects spoken over the vast territory once forming the colonial possessions of Spain afford an inexhaustible subject for the philologist. Among the contributions are the 15th edition of the *Diccionario de la Lengua Castellana*, by the Spanish Royal Academy (Madrid, 1925); *Diccionario Gallego Castellano* by the Royal Galician Academy (Coruña); Spanish Royal Academy's *Gramática de la Lengua Castellana* (Madrid, 1917); M. A. Roman, *Diccionario de Chilenismos y de Otras Locuciones Viciosas* (5th vol., Santiago de Chile, 1916-18); R. Foulché-Delbos and L. B. Dihigo, *Manuel de l'Hispanisant* (vol. i, New York, 1920); A. Zauner, *Altspanisches Elementarbuch* (Heidelberg, 1921); R. Menéndez Pidal, *Documentos Lingüísticos de España* (Madrid, 1923); Nebrija, *Gramática de la lengua castellana*, Salamanca, 1492 (London, 1926); R. K. Spaulding, *History and Syntax of the Progressive Constructions in Spanish* (Berkeley, Calif., 1926);

R. Grossmann, *Das ausländische Sprachgut im Spanischen des Río de la Plata* (Hamburg, 1928); Covarrubias, *Tesoro de la lengua castellana* ("micro" ed., New York, 1927); R. Menéndez Pidal, *Orígenes del español* (Madrid, 1926); and T. Navarro Tomás, *Compendio de ortología española* (Madrid, 1927); *Homenaje ofrecido a Menéndez Pidal* (3 vols., Madrid, 1928); cf. *Bibliografía Hispanoamericana in Revista de Estudios Hispánicos* (I-II, New York, 1928-29).

Catalan and Provençal.—W. Meyer-Lübke, *Das Katalanische* (Heidelberg, 1925); A. Griaer, *Atlas linguistique de Catalogne* (Montserratt, 1923); and W. P. Shepard, *The Oxford Provençal Chansonier* (Princeton, N. J., 1927).

Rumanian.—A. Scriban, *Gramatica limbii românești* (Jassy, 1926); G. Pascu, *La Philologie roumaine dans les pays germaniques et en France, 1774-1922* (Leipzig, 1927).

Phonetics.—J. Forchhammer, *Die Grundzüge der Phonetik* (Heidelberg, 1924); A. Trombetti, *Elementi di glottologia* (Bologna, 1924); K. Nyrop, *Manuel du français parlé* (Paris, 1925); T. Navarro Tomás, *Manual de pronunciación española* (Madrid, 1927); W. A. Craigie, *English Vowel Sounds* (New York, 1927); and Margaret P. McLean, *Good American Speech* (New York, 1928).

Dictionaries.—Cabrol and Leclercq, *Dictionnaire d'archéologie chrétienne et de liturgie* (Paris, 1925); H. W. Fowler, *Dictionary of Modern English Usage* (London, 1926); Lebrun and Toison, *Dictionnaire étymologique de la langue française* (Paris, 1926); P. Desfeuilles, *Dictionnaire de rimes* (Paris, 1926); A. A. Moll, *Spanish-English Medical Dictionary* (Chicago, 1926); G. M. Vergara, *Cuatro mil palabras no incluidas en el Diccionario de la Real Academia Española* (Madrid, 1926); H. E. Palmer, J. V. Martin, and F. G. Blandford, *Dictionary of English Pronunciation with American Variants* (New York, 1927); L. P. Smith, *Treasury of English Aphorisms* (Boston, 1928); H. B. English, *Students' Dictionary of Psychological Terms* (Yellow Springs, Ohio, 1928); J. Spiegel, *International Business Dictionary* (New York, 1928); L. Herendi, *Complete Dictionary of Banking Terms in Three Languages* (ib.).

PHILOSOPHY. The developments of greatest philosophical significance in the field of natural science were incidental to the attempt of the scientists to find a way of passing from one supposedly discrete science to another. The attempt to bridge the gulf between mathematics and physics issued in the theory of relativity; similarly, the attempted transition from physics to chemistry resulted in the statement of the problem of the structure of the atom and the quantum theory as a tentative answer. Less was done to articulate biology with its foregrounding sciences because the questions in that region are still manifold, but the controversy over vitalism and mechanism and the investigation of colloidal substances is significant. Psychology, at least in the English-speaking world, was in great danger of being subsumed under the other sciences such as physics, biology, and physiology, rather than being recognized as sufficiently independent to warrant the assignment of a special place and function in the scientific field, though the work of Wertheimer, Koffka, and Kohler in Gestalt theory tended to concentrate and establish the diverse experimental and theoretical findings on an independent

basis which was not wholly divorced from the European tradition.

However, this tendency to integrate the sciences did not exactly follow the lines of development laid down by Comte. Neo-positivism accounted for scientific thought in terms of mathematical correlation. Its chief spokesman reduced scientific hypothesis to the level of mathematical equation; the entity hypothesis was excluded as far as possible; the terms in these equations were merely convenient expressions substituted for observations and thus made amenable to mathematical treatment. This intellectual asceticism was justified by the facility it contributed to the scientific treatment of experience. It also enabled the scientist to appeal to mathematical presuppositions instead of outworn metaphysics when he was hard pressed to give some further account of his theories.

This need for interpretation, especially with regard to scientific formulas which involve non-Euclidean geometry, led to the further development of postulate theory and mathematical logic. So when, in 1919, it appeared that at least one of Einstein's predictions, which were based largely on non-Euclidean geometry and rather unconventional postulates, had been verified, greater importance was attached to the work of Peano, Frege, Cantor, Dedekind, Whitehead and Russell in mathematical theory. Here was observational evidence not only for Einstein's theory of relativity, but a naive philosophical mind was tempted to conclude that the mathematical presuppositions were also verified. Some not so well trained in mathematical theory were tempted to claim verification for their own special brand of metaphysics on the same ground. The discovery of the displacement of Mercury at perihelion was like Thales' discovery of the marvelous uses of the waters of the Nile and the subsequent founding of the Ionian school of nature philosophies: water, fluid, ice, steam, mathematics, non-Euclidean geometry, postulates, mathematical logic. We now had a scientific method in philosophy.

The more cautiously minded mathematicians and scientists disowned any such extrapolation, and rejoiced over the great advantages afforded by the theory of relativity for scientific method. The more philosophically minded saw the problem of rendering such an enormous system intelligible not so much for science as for human culture.

The problem arose from technical specializations and the complicated symbolisms that they employ. Symbolic logic is merely one of a host of such devices which dehumanize subject matters, and mystify the lay person. Following H. G. Wells's *Outline of History*, there was an avalanche of popularized knowledge. These were, in most cases, amateur attempts to expound the meaning of opaque symbols, and merely succeeded in confusing the settled knowledge of the ordinary mind. A problem in philosophical interpretation had been thrown to the mob and thus made more acute.

European continental philosophers had for a long time been fulfilling their interpretative functions, exercising both critical acumen and metaphysical insight in the assimilation of the new technical knowledge. England and America were far behind, but certain British philosophers and scientists came to fill the breach, Whitehead and Russell were conversant with the new physical theories and had become familiar

with the problems of symbolism. Whitehead himself had an alternative theory of relativity and proceeded to introduce an organic model for scientific objects more adequate to the new mathematical usages than the old mechanical model. Russell decoded physics and chemistry and reexpressed them in fine imaginatively clear pictures. Finally, Eddington, the astrophysicist, added his daring imaginative exposition to the interpretive process, and Haldane did likewise for biochemistry. In each case, some special brand of historical metaphysics was called into service as a basis for the summary and criticism of scientific knowledge. In America, Burt made a survey of historical metaphysical doctrines underlying physics, and Bridgman gave an account of physics in terms of scientific instruments and their operations.

The popular interpretation of scientific knowledge also had its recoil on the laboratory, and philosophers came to the aid of the scientist himself. There were specialized works on the problems of measurement, probability, induction, and verification, giving rise to new theories of sense perception, instrumental controls, and statistical mathematics.

The other natural sciences present problems like these, though less clearly formulated. The best scientific mind uses imagination and mathematics, the best philosophical mind criticizes and sets the results in consistent order; but it should be remembered that this is science, with philosophy as handmaiden. The scientist discovers and classifies, calling for philosophical criticism only to render his material intelligible, when no further progress can be made without such insight. Insight or wisdom performing this function is intellect domesticated or enslaved, mathematics and logistics take the place of logic, ethics, aesthetics, and metaphysics are ignored. Yet one sees in this commandeering of the philosophic insight and intuition the start of a return to the greater tradition in philosophy. The reference of scientific findings to an intellectually grasped or constructed system is not a new trick. One remembers that Plato found a function for hypothesis in his ascent to the ideas. Also, one must not forget that the modern procedure is not accidentally Platonic. The earlier Russell did not despise Platonism, and the latest Santayana embraces it with true aesthetic enthusiasm. What matters it that system or essence is substituted for the idea?

The rivals of this positivistic naturalism are the modern humanists. One would like here to review the so-called realistic and psychological novel and compare it with the Greek tragedy as the objectification of opinions on fundamentally philosophical themes. Or, on another level one might sift behavioristic and Freudian psychology for nuggets of wisdom, but here again we find the professional philosopher buying and using the novelist's and scientist's knowledge. The rationale of his doctrines is the biologist's or the sociologist's dogmas. The most obvious illustration of this is the pragmatic tradition in America. James, Freud, and Watson have sold their functional psychologies to both the professionals and the guildsmen of humanistic sciences. Their psychologies are ultimately physiological, biological, or sociological, and the philosophizing which one finds is the reference of this or that particular fact to one of these systems. Humanism means then that man the

organism, man the psyche, man the citizen of a commonwealth is the measure of all things. Glands, unit characteristics, instincts, conditioned responses, complexes, survival value, adaptation, social expediency are terms to conjure with. They are the inner Fates and Nemesis of our human existence. Yet the relativism of these concepts is admitted in the writings of Dewey, Pound, and McDougall. Man's creative intelligence measures and moves on.

In France, Durkheim and Lévy-Bruhl and in England Westermarck and Hobbhouse set up the science of anthropology as a system of reference. Aesthetics, logic, ethics, all have a genesis and *raison d'être* in man's social experience. Mores, taboos, and ritual supply the necessity of man's life and knowledge. But there was a more sophisticated European tradition which had not only appropriated but assimilated the concepts of biology and anthropology. It not only avoided but condemned what it called psychologism. It reduced scientific classification and subordination to the level of arbitrarily specialized categories and asserted the superiority and finality of the intuitive comprehension of experience. It drew upon Spinoza, Kant, and Hegel. It placed the aesthetic at the foundation of knowledge and the ethical at the top and demanded the integration of this or that bit of knowledge in the light of the immediately given whole. However, that it paid for its sophistication is evident from the difficulties it encountered. More often than not an attempt was made to characterize its ultimates in terms of its most hated scientific disreputables. Bergson never escaped the biologism of his *élan vital*, Croce fell into the Hegelian fiasco of identifying spirit with human history; Brunschvicg fell short of Spinozistic substance and was content with the onward march of man through his flux of experience. Humanism had its usual limitations. Santayana's Realm of Spirit illumines, enchants, and dies away.

In general, recent philosophy has taken its critical duties more seriously, particularly with regard to science, and thus has brought about a shift in its own emphases. Specialization in the sciences is reflected in the many methods of philosophic speculation. This methodological pluralism has in turn revived an interest in dialectic and the versatile use of its many forms.

The most widely accepted dialectical doctrine is called creative or emergent evolution. Its fundamental intent was foreshadowed in Spencer's *Synthetic Philosophy*, but it remained for Bergson to provide it with a more sophisticated formula. He took his cues from Schelling, Schopenhauer, and Aristotle and succeeded in splitting the various scientific analyses off from the immediate data of consciousness, and stating the philosophical problem in terms of abstraction and intuition. Alexander paid more attention to the abstractions. He arranged them in a series ascending from space and time to God, bridging the gaps by a creative synthesis which he renamed "emergence." This has become, in the hands of his followers, a metaphysics in the grand manner; it is essentially a reversal of the neo-Platonic theory of "emanations." Deity reveals itself through an emergent evolution in time.

The greater part of the philosophy of science distributes itself around this theme in truly dialectical fashion. Empirical data are referred

to this or that level of a hierarchy in which any higher stage is a synthesis of the lower stages. Abstractions are particularized and find concrete embodiment in the temporal process.

However, creation and emergence are taken as problems by logicians, and are usually rejected by philosophers who have logical scruples. They rather maintain an abstract discreteness and look for logical devices for passing from one universe of discourse to another. In some cases, this is achieved by mathematical transformations like those used in Einstein's relativity, or in some neo-Hegelian form of idealism. For the most part, there is a return to a Platonic theory of ideas, and there have been many signs of a return to the old metaphysical themes of ancient Greek, mediæval scholastic, or seventeenth-century rationalism. Taylor's work on Plato with reference to the mathematics and physics of Eddington, Whitehead, and Russell; new editions, translations, or critical studies of Scotus Erigena, Thomas Aquinas, Roger Bacon, and Duns Scotus; and scholarly expositions of the systems and methods of Descartes, Spinoza, and Leibniz have been brought to bear on the dialectical problems. Original modern work in science and logic has reached a point where long forgotten subtleties of the past reappear and historical forms of thought can again be appreciated.

In all this, the fundamental problem is Platonic, the relevance and significance of ideas in their relations with things. Slowly, the whole field of philosophy is gaining the Platonic orientation and rigorous formulation.

In general, Platonic method proceeds from observed particulars through hypotheses to principles. Modern science and historical studies aid in this process. Perhaps the most promising of these dialectical philosophies is being constructed by Husserl. Hypotheses are disregarded and the "ground principles" are caught in the immediate forms of experience. Husserl avoids the method of mathematical logic and scientific symbolism and invents his own terminology. His own writings are difficult and his work is yet incomplete, so that an estimate is very difficult to make at present. The attention of professional philosophers, however, is turned in that direction and expectation is high. If the expectation is fulfilled, a great deal of lyrical impressionism and empty professional ritual in philosophy can be dispensed with in the near future. It is time for philosophy to break through the confining authority of the scientific movement.

PHOSPHATE ROCK. The abundant supplies of phosphate found in the United States offset the utter deficiency of nitrates and potash. These three materials are essential fertilizing substances for agriculture and where not available must be imported. In 1920, the world's production of phosphate rock was estimated at 6,725,215 long tons, of which the United States produced 4,170,056 long tons. This, of course, was a record production, there being subsequently a marked decline. The phosphate deposits of Florida furnish from 75 to 85 per cent of the annual American output, and are followed by Tennessee and Kentucky. The two main types of phosphate rock are hard rock and pebble. The Florida deposits are mainly land-pebble rock, while the Tennessee deposits are of various types. In the western United States, phosphate rock has been discovered chiefly in Idaho, Wyoming, and Utah, where they occur near the base of the Carboniferous. In 1924, the United States had two extensive phosphate reserves, one in Florida and one in the Western States, and there was no anxiety regarding future needs. In fact, high-grade superphosphate had been produced by a copper-mining company from material mined in one of the Rocky Mountain States.

Though the production of rock phosphate in the United States has consistently remained below the 4,170,056-long-ton record set in 1920,

the world output has steadily increased, reaching 9,386,288 long tons in 1926, and not far from 10,000,000 in 1928. The most important phosphate-producing countries in 1926, in the order of tonnage produced, were: United States, Tunis, Morocco, Algeria, Ocean and Nauru Islands, France, Egypt, Gilbert and Ellice Islands, Christmas Island, and Makatea Island. Before the World War, the domestic production was about equally divided between the United States and Europe, but the bulk of the native output is now consumed in the United States. Not only does the growing demand for fertilizers assure an increase in the production of phosphate rock, regardless of the export trade, but the use of phosphate acid and phosphate compounds for other purposes is always expanding.

The gradual exhaustion of higher grade deposits of phosphate rock has not only brought about an increase in the production of phosphoric acid using lower grades of rock at source but has stimulated research in various methods of using lower grades of phosphates in the production of phosphoric acid or conversion to concentrated fertilizers. The U. S. Bureau of Soils is engaged in investigating pyrolytic or heat methods, as well as wet methods, for the manufacture of phosphoric acid. The U. S. Bureau of Mines is engaged in research in the concentration of the low-grade phosphate rocks for the production of a high-grade phosphate product. See FERTILIZERS

PHOSPHATES. See FERTILIZERS.

PHOTOCHEMISTRY. See CHEMISTRY.

PHOTOGRAPHY. The photographic industry, that is, the organized manufacture of sensitized materials and apparatus, began about 1876 and since that date has expanded very rapidly. One of its offsprings, the motion-picture industry, has in the last two decades so far overshadowed its parent that it now is to be recognized as the world's fourth largest industry. This rapid expansion unfortunately was not accompanied by a corresponding increase in an understanding of the scientific laws underlying the photographic process. Emulsion making continued to be largely a practical art. About 1908, however, hopeful signs of a new regime appeared as photographic manufacturers started to organize research staffs. The Kodak Company established a research department at Rochester, N. Y., in 1912, which grew from a nucleus of 15 to over 175 scientists and assistants during the succeeding decade and a half. Laboratories were established also by other firms in England, France, and Germany. The British Photographic Research Association was founded in 1918. It was supported largely by the Government and contributions of photographic manufacturers. A research laboratory was established in 1928 by Kodak, Ltd., Harlow, England. As a result of this changed attitude, theoretical research advanced so rapidly during the period covered by this report that it outdistanced practice. During that interval, photography passed through a transition period, and the future holds much promise for a more precise science when the knowledge gained will be applied to control emulsion technique and development practice.

Photographic Organizations. Interest in photography is fostered by about one thousand camera clubs and associations in various parts of the world, England leading with over four hundred societies chief among which is the

Royal Photographic Society. This association sponsored the Seventh International Congress of Photography held in London in July, 1928. The Sixth Congress met in Paris in 1925 under the auspices of the Société Française de Photographie. These meetings were great clearing houses of information and much was accomplished toward international standardization of methods and apparatus used in photographic research.

Military Photography. The World War, 1914-1918, had an important effect on increasing national appreciation of the value of photography. Hundreds of thousands of photographic records of cities and towns, terrain conditions and troop movements were made, and millions of feet of motion-picture film were exposed. The art of camouflage was analyzed and studied by means of photography.¹ Aerial photography was developed from an almost unknown application into a valuable ally of the armies.² Special cameras and film were manufactured to suit its exacting requirements. In more recent years, aerial photography has been used extensively in connection with surveying, map making, studying unexplored territories, revealing hidden shoals under water, surveying traffic in large cities, etc. The use of the photographic film and plate as a recording medium for X-rays was developed extensively during the War. The majority of modern hospitals later were equipped with X-ray apparatus, dentists utilized the X-ray in diagnosis; and most of the large manufacturing plants considered its installation a valuable and necessary part of their medical departments.

These applications and other uses of photography were probably an underlying cause for the present position of photography as a "key industry."

Theoretical Progress. Significant among the achievements of theoretical interest which formed the groundwork for future practice were (1) the study of the cause of sensitiveness of photographic emulsions (the name commonly applied to a suspension of finely divided particles of silver salts in gelatin), (2) the progress made toward a better understanding of those physico-chemical reactions which form the basis of emulsion making, and (3) the investigation of the laws underlying the use of photographic materials, that is, the fidelity with which the tones of the original subject are reproduced in the final photographic print. Valuable contributions to all these subjects have been published by investigators in the United States, England, France, Germany, Sweden, Austria, Italy, and Russia.

Besides the reported progress in many fields, the literature of photography was enhanced by the following new publications: *Le Photographe*, 1913; *Abridged Scientific Publications of the Kodak Research Laboratories*, issued since 1914; *Monthly Abstract Bulletin*, issued since 1915 by the Kodak Research Laboratories; *Transactions, Society Motion Picture Engineers*, 1916; *Nordisk Tidskrift for Fotografi* (Swedish), 1917; *Svensk Fotografisk Tidskrift* (Swedish), 1917; *Die Kinetik*, 1919; *Revue française de Photographie*, 1920; *American Cinematographer*, 1920; *The Camera* (Ireland), 1921; *Photofrond*, 1921; *Photographic Abstracts*, initiated in 1921 by the Royal Photographic Society; *Camera* (Swiss), published first in 1922; *Educational Screen*, 1922; *New Photographer* (English),

1923-28 combined in 1928 with *Amateur Photographer* (English); *Filmtechnik*, 1925; *Movie Makers*, 1926; *Soviet Foto* (Russian), 1926; *Fotograf* (Russian), 1926; *Ciné Miniature*, 1927; *Bulletin of the Academy of Motion Picture Arts and Sciences*, 1927.

Applications of Photography. One of the notable applications of photography has been its use in photomechanical processes. The extensive and continually increasing use of illustrations in books, magazines, and newspapers for the most part can be attributed to photography. Rotary photogravure has come to be a common addition to magazines, pictorial news weeklies, and Sunday supplements, being printed about 1927 in two and more colors. The tremendous increase in the use of color in advertising is closely related to developments in three-color lithography. Photo-composing machines were developed to replace mechanical typesetters, and also the wet collodion plate used for over a half-century began to be displaced in 1928 by the use of a gelatin-coated stripping paper.³ Pictorial telegraphy found increasing use in illustrated journalism about 1926 and radio and wireless transmission of photographs also showed promise.

Motion Pictures. Motion-picture photography has developed considerably since 1914, contributing not only to the world's amusement but also to its education and instruction. Reliable estimates made in 1928 stated that there were over 57,000 film theatres throughout the world. In the United States alone, there were 20,500 theatres and some two billion dollars was invested in the industry, which used a billion and a quarter feet of film yearly. There were approximately 235,000 persons engaged actively in furthering motion-picture production and exhibition. Leading production centres were Hollywood, Calif., and New York City in the United States, Elstree in England, Berlin in Germany, and Paris in France.

In the earlier years of the industry, motion

pictures were all taken either out of doors or in large glass studios resembling huge greenhouses. With the development of suitable apparatus, artificial lighting came into use, and made film production independent of weather conditions. Arc lights and mercury vapor units for lighting interior sets were used almost exclusively until about 1927, when panchromatic (all-color sensitive) film came into great favor and incandescent lamps were commonly employed. The carbon arc manufacturers then developed panchromatic carbons which were cored with rare earth metals giving a wide range of spectral illumination. A combination lamp suitable for exposing panchromatic film was also introduced in the form of a mercury-vapor-neon-gas lamp.

Modern studios established for this growing industry soon constituted small cities where many branches of activity were in progress as represented by the carpenters, machinists, masons, plumbers, painters, decorators, artists, sculptors, etc., each group contributing its share to create sets for the director to populate and the cameramen to reproduce on miles of film "ribbons."

In 1928, studio routine was greatly changed by the introduction of methods of reproducing sound in conjunction with pictures. The silent actors now acquired voices or stepped aside for those who could speak as well as act, and directors had to develop a new technique. Special recording studios were built having one or more silent "stages," where the action took place. Electrical, acoustic, and mechanical engineers became associated with the industry as the delicate recording and reproducing equipment and conditions for its use required scientific control. This development was made possible only by the increased understanding of the properties of photographic emulsions and a greater knowledge of the theory of tone reproduction.

Distribution of motion pictures to the theatres grew into a business-like though rather complex trade by 1920.

The motion picture has had a profound effect on American architecture. Previous to 1918, most pictures were shown in rejuvenated vaudeville houses. New buildings then began to appear incorporating many beautiful designs of ancient and modern art, Chinese, Spanish, Gothic, and even the early Mayan civilization of Central America being represented. The largest of these theatres was the Roxy, which has been called the "Cathedral of the Motion Picture." It seats 6000 persons and was opened in 1926 in New York City.

Research in motion pictures is fostered by the Society of Motion Picture Engineers organized in 1916. The *Transactions* of this society contains accounts of much of the significant research done in this important field throughout the world, as papers are solicited from foreign countries as well as from the United States. Two other societies which exert an important influence on the trend of the industry's affairs are the Motion Picture Producers and Distributors of America, Inc. and the Academy of Motion Picture Arts and Sciences, representing the writers, technicians, actors, directors, and producers.

Well-organized programmes for the production and distribution of films for classroom use were under way in 1928 in connection with geography, general science, and medicine. Universities were awakening to the need of cultural, as well as instructional, courses in motion-picture photography.

A successful, practical method of amateur cinematography⁴ was introduced in 1923. It grew rapidly until in 1928 there were about 100,000 users of such equipment. The success of this process depended upon (1) the introduction of a special, fine-grained emulsion, (2) the use of a small-sized safety film of 16-mm. width (compared with 35-mm. width used for standard film) having 40 pictures to the foot instead of the usual 16 pictures; (3) the conversion by a special developing process of the original negative into the projection positive (Fig. 1); and (4) a general lowering of costs. Many designs of cameras, projectors, and accessories were introduced, film libraries were formed, and amateur cinema clubs organized to produce pictures.

Color Photography. Since 1914 there have been witnessed many courageous attempts to realize the ultimate in photographic perfection—photographs in natural colors.⁵ Natural-color processes fall into two broad classes, *additive* and *subtractive* methods. All processes of both types having any commercial success thus far have utilized some form of color filter when taking the pictures. In the additive type, the positive record is nearly always a black-and-white transparency and is examined by placing suitable color filters in the optical path of the light transmitted by the image. Examples of the additive method are the Zochrom process of color motion pictures demonstrated by C. H. Friese-Greene in 1925 and J. Szczepank's continuous camera and projector for the three-color motion pictures which was exploited in 1924-25.

The Agfa color plate originally announced in 1916 and introduced in 1923 also met with considerable favor. This is a screen-plate process in which the three-color screen in near contact with the emulsion is composed of dyed particles of gum arabic rolled out in collodion. It represents the most successful screen-plate process since the Lumière Autochrome was introduced

in 1907. Color-screen methods were first applied with some commercial success to roll film and film packs by the Lignose Company in 1927.

The subtractive method appeared to find greater favor, perhaps because the final image is actually colored and usually requires less complicated apparatus for examination. Print processes usually embody the subtractive principle. In 1923 H. J. C. Deeks announced his Raylo process in which three negatives were exposed simultaneously through primary filters in a special camera. Prints were made from them by projection on to specially sensitized tissues and the separate tissues were then brought in to register under water. Several years later, this same inventor introduced specially sensitized color sheets for use with any set of three-color negatives. Two other print processes deserve mention, namely, the wash-off Jos-Pe method introduced about 1924 and the Lage process announced in 1927. Two-color subtractive processes having certain features in common were Kodachrome based on the patents of J. G. Capstaff and Technicolor founded on the Comstock patents. The latter was used more extensively in commercial motion-picture production than any other color process devised up to 1928.

Natural color motion pictures for the amateur⁶ became available in 1928 when Kodacolor film was announced for use in 16-mm. equipment distributed by the Kodak Company⁶ (Fig. 2 on the accompanying Plate I). This is a three-color additive process which realizes the principles of a line-screen method without the added difficulty of ruling a screen on the film support. The secret of the process is based on a means of impressing a parallel series of microscopic cylindrical lenses into and along the length of the support side of panchromatic film. A banded three-color filter is fitted into a support in front of the lens of the camera and projector. The film is threaded into the camera with the emulsion side away from the lens so that the light passing through the filter must be transmitted by the tiny embossed lenses each one of which thus images the bands of the color filter on the film.

X-ray photography found extensive use in conjunction with commercial work,⁷ besides its employment in connection with clinical diagnosis. A few of the many uses are examination of welds in steel, detection of decayed areas in living trees (Fig. 1 on Plate II) inspection of the quality of false teeth, revealing changes in paintings, etc. An English firm inspected over 2000 articles per day with one X-ray outfit.

Photography has come to be used very extensively for recording scientific data. Astronomers have found it an indispensable ally for many years in the determination of the size, composition, color, and location of stars, planets, and nebulae. Without its aid, one of the most valuable checks on the Einstein theory could never have been obtained; this was the deflection of light from stars near the sun which was verified during the eclipse of May 29, 1919. See Physics.

The photographic emulsion offers the only means of accurately recording many reactions invisible to the eye. Rapid physical and chemical changes may be recorded quickly for later examination with more deliberation. A review⁸ containing over 150 references to papers on applications of photography was published in 1927. Examples described dealt with uses in

chemistry, physics, geology, psychology, astronomy, engineering, and medicine, besides numerous miscellaneous applications.

Physical Measurements. A quantitative method for expressing the characteristics of photographic emulsions was first worked out by F. Hurter and V. C. Driffield in 1890. They studied systematically the relation between exposure, development, and the silver deposit produced in the photographic process.⁹ Subsequent investigators confirmed their results and the fundamental method devised by them is essentially that used today.

Since 1918 great progress has been made in the design of precision instruments¹⁰ for controlling exposure, processing the sensitive material, and interpreting the result. Instruments for impressing a series of known exposures on a sensitive material are called *sensitometers* and the method of exposure and recording the results, *sensitometry*. Instruments for measuring the opacity or reflection of silver deposits are known as *densitometers*. These two types of instruments have been used extensively in connection with most all precision work in photography.

For many years there has been an organized effort made to reach definite international standards in regard to the methods of measuring the properties of photographic emulsions and expressing the results, so that experimenters in various parts of the world would be able to conduct their investigations on a comparable basis.¹¹ Two problems of utmost importance have been examined extensively, namely (1) the quality of the light source used for sensitometric work, and (2) the intensity level used in making photographic exposures. The latter is called the *reciprocity* effect and expresses the relation between time and intensity in the resulting photographic density. The Congresses of Photography and the national physical and optical societies have assisted greatly in bringing about international agreement on many of these problems.

A question of fundamental importance in all photographic work is that of tone reproduction. According to Mees,¹² this has been summarized as follows: "When a photograph of a natural object is made, the form can be represented only by differences in brightness. The accuracy with which the form is represented depends upon the precision with which the tones of the original subject are reproduced." Although much progress had been made on this problem previous to 1913, it was not until that year that an intensive attack was organized by the newly formed Research Laboratory of the Kodak Company. The effort was centred mainly on the behavior of printing materials, which had been studied only slightly. A series of papers was published dealing with the properties of printing papers, the sensitiveness of the eye under different illumination conditions, and a graphic solution of the theory of tone reproduction. Workers in Germany and England also published a great deal on the same subject. It may reasonably be stated that a fairly complete solution for the problem is now known.¹³

There has been considerable inconsistency in the methods used by various manufacturers for specifying sensitiveness or "speed" numbers for photographic films and plates. A method which gives a value conforming more nearly

to the usage of modern emulsions was worked out and instruments which simulate conditions like those existing in the camera were described.

The extensive employment of photography as a working tool in almost all branches of physics, spectroscopy, astronomy, atomic structure, studies on electrons, etc., indicates the importance of adequate knowledge of the advantages and limitations of the photographic emulsion as a recording medium. Valuable work was done toward this end¹⁴ relating to the formation of details of images, resolving power of photographic materials, and distortion of images.

Other important physical measurements¹⁵ on which work was done dealt with methods of measuring the color sensitivity of photographic materials, the spectral transmission of filters, and the reflecting power of colored objects.

Manufacture of Sensitized Materials. Two broad classes of sensitized materials are known, namely, (1) those in which the silver halide is formed in the presence of excess silver salt, examples of which are wet collodion, and most printing-out-emulsions, and (2) those in which the silver halide is formed in the presence of excess soluble halide, which includes positive and negative emulsions requiring chemical development. The former types though still used to some extent in photomechanical processes, are rapidly losing favor for general photographic work and have been replaced largely by the latter group.

Negative emulsions usually contain a small quantity of soluble iodide comprising about 5 per cent of the total silver halide. Positive emulsions normally consist of nearly pure silver bromide, or chlorobromide, or of pure silver chloride. Precipitation of the silver halides in all emulsions is a very critical operation. Some emulsions are "ripened" by heating the emulsion above the temperature of the melting point of the gelatin, which introduces certain changes in the size of the particles and affects their sensitiveness.

Glass, nitrocellulose, acetocellulose, and paper have been used as supports for coating emulsions. Although glass has certain advantages such as rigidity and non-flammability, it is heavy, easily broken, and bulky and has been replaced to a great extent by nitrate and acetate film. The properties of nitrocellulose have been studied very thoroughly since it was first used by Eastman as a film support in 1889. The patent literature was amplified considerably by individuals and manufacturers who disclosed various cellulosic compositions. Numerous patents were also taken out in relation to the use of anti-fogging agents, non-halation chemicals, and anti-static compounds, as well as methods of laminating film. The properties of papers for photographic use and materials for coating substratum have been examined very thoroughly.

With the introduction of amateur ciné equipment in 1923, and even previous to that, acetate film was used to some extent; in fact, its use was compulsory in certain European countries. A survey of patents taken out since 1923 indicated a definite trend toward a wider adoption of the so-called "safety base." Its difficulty of manufacture and tendency toward brittleness no doubt retarded earlier adoption.

The technic of coating film support in sheets continues to be one of the secrets of the film

manufacturer, although descriptions of the machinery and methods used have been published.¹⁶

Physical properties of gelatin, choice of gelatins for photographic use, and changes in gelatin during processing were investigated critically during the last fourteen years. Instruments for measuring swelling, viscosity, resistance to scratching, and other properties of gelatins were devised.¹⁷

For many years, emulsion makers knew that certain gelatins were satisfactory and others were unsatisfactory for photographic use. In 1925, Sheppard¹⁸ announced the discovery of the presence in gelatin of a definite chemical substance known as allyl thiocarbimide. Its presence in minute concentrations of one part in 1,000,000 to one part in 300,000 was shown to be the cause of the suitability of certain gelatin samples for use in photographic emulsions. During the emulsion-making process, this substance is converted over by a series of chemical reactions into silver sulphide which was shown to be present as extremely small specks or *nuclei* on

16-mm. safety base was made available for the ciné amateur in 1928. The difficulty of making duplicate negatives of valuable original motion-picture negatives was greatly lessened by the introduction of a special film emulsion for this purpose in 1927.

The spectral sensitivity of photographic emulsions has greatly extended since 1914 mainly as a result of the discovery of additional sensitizing dyes¹⁹ (Fig 2). Spurred on by the shortage of dyes during the World War, the bulk of which had been made previously in Germany, English scientists, especially Mills and his collaborators, studied and elucidated the structure of the sensitizing dyes. Experimenters in America discovered new sensitizers Kryptocyanine was announced in 1919 and neocyanine in 1925, each of which sensitized well into the infra-red region, the latter to wave-length 1000. Plates sensitized with such dyes found valuable application in astronomy in connection with the photography of Mars and other planets and films so sensitized were used to reproduce "night effects"

FIG 2. PROGRESS IN COLOR SENSITIZING OF PHOTOGRAPHIC EMULSIONS

the crystals of silver halide. The presence of these nuclei was proven to be necessary in order to make the grains developable after exposure. Other investigators subsequently corroborated many phases of Sheppard's discovery, which was regarded as the most valuable advance made in photographic science in the last 25 years.

A number of papers and patents dealing with emulsion making have been published by various authors throughout the world. One important series, whose publication was encouraging to note, represented investigations by scientists at the U. S. Bureau of Standards.

Panchromatic film was introduced about 1914 and although much less sensitive than the orthochromatic film, the speed was increased until in 1927, it was rated about 20 per cent faster than the usual portrait emulsions. Its use for motion-picture work became very general about that same year and by 1928 the major portion of all ciné negatives were being made on panchromatic film. Panchromatic reversal film on

by daylight exposure. Methods of hypersensitizing emulsions were worked out whereby the white light, as well as the color sensitiveness, could be enhanced by bathing the films in certain solutions after manufacture.

Various types of X-ray intensifying screens were devised incorporating calcium tungstate which fluoresced under ultra-violet radiation. These were placed in contact with dupli-tized X-ray film (coated on both sides with emulsion) in order to reduce the effective X-ray exposure and thus decrease the danger to the patient.

Several papers and a great many patents described light-sensitive diazo compounds and allied substances.²⁰ Papers coated with these compounds and a coupling agent are used as substitutes for blue-print paper. Inclusion of a weak organic acid prevents the two chemicals from reacting to form a dye, but if this acid is neutralized by treating the paper with ammonia gas, the diazo compound is decomposed and no dye is produced by the ammonia treatment.

The process is therefore a method of producing positive images directly. Ozaphane motion-picture film consisting of a diazo compound coated on an extremely thin viscose layer was used commercially in Europe about 1928.

Photographic Apparatus. Studio cameras have not changed appreciably during the last quarter century, though notable improvements have been made in accessories for them such as lenses, shutters, and film and plate holders. Anastigmat lenses were introduced and faster emulsions permitted much shorter exposures. Home portraiture particularly of children was thus made possible and a marked improvement in naturalness of expression was noted. Perhaps the greatest advance in amateur camera design was the introduction of small lenses of wide aperture. Several manufacturers and the United States government did considerable research on methods of making optical glass during and after the World War, until a product of high quality was produced.²¹ Anastigmats working at a maximum stop of $f/1.5$ were used in a few small cameras, and lenses of $f/4.5$ and $f/6.3$ were quite common. Professional motion-picture cameras were regularly equipped with $f/1.9$ lenses. Used in conjunction with the fast panchromatic film, such lenses made possible exposures of street scenes at night, such as lighted store windows and electrical advertising displays. Several types of precision shutters were introduced and various exposure meters designed. The era of color in merchandise invaded the camera field and several firms marketed cameras in colored leathers in 1928.

Artificial light was very popular in portrait and commercial studios beginning about 1925. Incandescent lamps, arc lights, and mercury vapor units were employed.

Printing methods were somewhat revolutionized by the introduction of projection printers about 1920. These devices were automatically focussing, used bromide or chloro-bromide papers, and enabled very rapid changes to be made in the size of the enlargement. Contact printers working more rapidly than earlier models also found considerable favor.

The modern professional motion-picture camera was a marvel of precision workmanship and cost several thousand dollars. Motor-driven cameras replaced hand-cranked cameras almost entirely for professional work. For "trick" photography, special devices for cameras, backgrounds, and printers were worked out. Several portable cameras taking 35-mm film were adopted. Cameras for exposing pictures at definite time intervals for subsequent projection at a normal rate were developed as well as a camera which operated at speeds as high as 5000 pictures per second. A special exposing device developed by Tokio Imperial University made records at the inconceivable speed of 20,000 pictures per second.

Sound motion pictures resulted in fundamental changes in camera and projector design. In several processes, the sound record was printed along one edge of the film²² either as a variable density or a variable width record. In another method, it was recorded separately on wax discs like those used for phonographic recording.²³ (See Fig 1, Plate 1). Elaborate devices in certain of these systems were used for keeping the picture and the sound in synchronism. Special portable recording units were fitted on auto trucks for use by the cameraman recording news events.

Arc lamps were used in most theatres as the projector illuminant. Mirror arcs were introduced about 1923 and on test these showed a higher screen illumination for a given amperage than the more common triple-condenser arc. Improvement in carbon manufacture also produced more efficient lighting units. Extensive improvements in ease and uniformity of operation of projectors were noted, relating to methods of voltage control, automatic carbon feeds, safety shutters for fire projection, etc. Intermittent mechanisms were used universally, but a few projectors showed promise which utilized optical principles permitting continuous projection.

Many devices for realizing stereoscopic relief in motion pictures were described and patented, but none had sufficient merit to cause their commercial adoption.

Nearly all amateur ciné cameras were spring-driven and a large number of different models were placed on the market after amateur motion pictures came into use about 1923. The bulk of these cameras used 16-mm. film but a few were designed for use with 35-28-, and 9.5-mm. films, respectively. Amateur projectors were very compact, motor driven, and projected pictures on screens ranging from $16\frac{1}{2}$ by 22 inches, as used for amateur natural color films, to sizes as large as $4\frac{1}{2}$ x 6 feet. Almost as many attachments for cameras, projectors, and other purposes were made available for the amateur as were used by the professional.

Automatic processing machines began to be used about 1927 in plants which developed and printed amateur roll films. This work, which was originally done for years by the amateurs themselves, was segregated about 1920 in finishing plants. These expanded so rapidly that by 1927 about 90 per cent of amateur films were handled by such establishments. Rapid delivery service was featured, made possible by the use of special printing machinery, capable of turning out 2000 prints daily from each unit when handled by experienced operators. Drying devices were used that simultaneously imparted a gloss to the print surface.

Automatic machinery was patented for processing amateur ciné reversal film. A unique feature of these machines was an exposure device which measured the heat transmitted by the silver image and thereby regulated the exposure for the second or positive image.²⁴

The processing of motion-picture film was done for many years on reels or racks on which the film was wound before immersing it in the solutions. Negative film used in the camera for taking the pictures was much more sensitive and required more careful handling than the positive film used for printing and theatre projection. As the industry expanded, automatic developing machinery was devised, first for the positive film and later for the negative. These machines automatically developed, fixed, washed, dried, and wound the film again into rolls. With the introduction of sound pictures, greater care was necessary in the processing, and scientific control of development²⁵ was introduced in 1928.

Coin-actuated automatic cameras were brought out in 1926-27 which exposed, developed, fixed, washed, dried, and delivered a series of portraits. Accounting by photographic methods virtually was inaugurated in 1928 with the installation by several New York and Philadelphia banks of a unique camera which photographed the checks passing each day through the bank. Eight

thousand checks could be recorded on 100 feet of 16-mm. film.

The Photographic Process. Previous to the World War, many developing agents were manufactured in Germany and certain of these, particularly metol, were supplied exclusively by a German manufacturer. With imports cut off, chemists in England, France, and America began to study methods of preparing developing substances. By 1916, fairly satisfactory substitutes were in use and in 1917, metol and p-aminophenol were being produced in England and the United States. A great many other developers were marketed, but most of them were open to one or more objections and their use was only temporary. The chief developers in use in 1928 were pyrogallol, hydroquinone, methyl-p-aminophenol (elon) and to a more limited extent, amidol, glycin, pyrocatechin, and p-aminophenol.

The chemistry of development was still only vaguely understood though much valuable progress had been made. Types of fog were classified and a theory proposed as to their probable cause.²⁰ Other subjects discussed were: staining properties of developers, the reducing power of various developing agents; the effect of age on development properties, effect of agitation on the rate of development; the cause of rack marks and air-bell spots; the action of solutions on containers, the function of various developer ingredients, etc. A constituent of metol causing skin poisoning was isolated. A motion picture made by Tuttle and Trivelli of the actual development of silver bromide grains represented a very fine example of photomicrographic technique. See Plate, II, Fig. 3.

A group of dyes called *desensitizers* were found to be very useful in connection with development technique. The first of the series, phenosafranine²⁷ was announced by Luppocramer in 1920. Very dilute water solutions of these dyes (1:500,000 to 1:10,000) were used as a preliminary bath or actually added to the developer. After about one minute's immersion, the film could be developed before a much brighter safelight than was normally used. The chemistry of desensitizers was investigated and theories proposed as to the mechanism of their action.²⁸

Methods for handling film under adverse conditions such as exist in the tropics or arctic regions were described. The causes and prevention of static electricity markings were treated.

The chemistry of fixing baths was studied²⁹ and valuable suggestions advanced relative to methods of recovery of silver from used hypo solutions.³⁰ A series of important articles were published on the mechanics and chemistry of washing films and papers.³¹ The sensitometry and use of intensifiers and reducers was studied. Toning of silver images with sulphide and hypo-alum mixtures continued to be popular, but newer methods utilizing palladium, selenium, tellurium, tin salts, copper salts, and various dye solutions found limited favor. In this connection, the introduction of positive motion-picture film coated on various colored supports largely displaced and made unnecessary the use of dye-tinting solutions.

The subject of methods of treating photographic materials to insure preservation on long-time storage was being seriously investigated in 1927-28. Film samples containing silver images prepared 30 years before were known to be in excellent condition, but other cases

where complete decomposition had occurred in a few years were all too frequent. A committee of the Royal Photographic Society prepared a valuable report on the subject of sensitive material preservation.³²

Photo-Theory. The study of the fundamental theory of the photographic process has been in progress for many years. Individual workers have done and are continuing to do research of the first order, but the greatest strides toward the solution of some of these complex problems have been made as a result of organized research supported by governments and by large industrial concerns. This work has been directed largely along two main channels, namely (1) the determination of the cause of sensitiveness of photographic emulsions, and (2) the explanation of the mechanism of the formation of the latent image, or the invisible image resulting from exposure.

Although photographic images are homogeneous in appearance, their heterogeneous composition is readily seen upon examining them under a high-power-microscope. See Plate II, Fig. 2. This instrument has proven an invaluable tool in studying the characteristics of the structure of the image. A statistical microscopic study of the properties of single grains was started in 1921 by the Swedish chemist, Svedberg.³³ Very thin films were coated on glass plates so that the sensitive grains were practically in a single layer following the method devised by Bellach in 1903 and later used by Sheppard and Mees. Svedberg found by actually classifying individual grains into sizes and counting the number in each class, that for any given exposure, the number of developed grains increased with increasing grain size. He also found that the number of developed grains for a given size increased with the exposure increase.

Besides these important researches, another series of investigations of equal value dealt with a statistical study of methods employed in the preparation of emulsions and the photographic properties of the material obtained.³⁴ Single-layer coatings were made in various ways, magnified 10,000 times, and the size-distribution of the individual grains determined. This work is still in progress but evidence up to 1928 indicated that there were very close connections between the grain size-distribution and photographic properties of emulsions.

Both chemical as well as physical theories of the nature of the latent image have been proposed. With print-out emulsions, actual amounts of liberated halogen have been weighed and other observable facts made known. With developing-out emulsions, where no visible change is produced by light, the extent of the change cannot be detected by any known method of weighing, and it is only by treatment with certain developing chemicals that any effect can be revealed.

Extensive studies were made of the action of various oxidizing agents such as chromic acid on the latent image. It was shown also that sodium arsenite and hydrogen peroxide produced effects similar to light action when emulsions were treated under certain conditions with these chemicals. Although there was other valuable work being done on the chemical side of this problem, space available for its discussion is limited and the original papers should be consulted for further details.

For many years it has been suggested by vari-

ous investigators that the latent image consists of a reduction product of silver halide, and very probably, according to Lippincott-Cramer,³⁵ of colloidal silver. Investigations by Svedberg, Toy, Trivelli, and others showed that, in spite of the enormous number of silver halide grains in an emulsion (as high as one billion to the square centimeter), the individual grains act independently unless two or more are in actual intimate contact. A more or less critical minimum exposure was found necessary to make a grain developable in a given time, in a given developer, and at a definite concentration and temperature; below this amount of exposure, the grain is undevelopable under the given conditions; above this amount, it is capable of being developed completely and as a rule does develop completely. All grains are not equally sensitive but in general for the most part it has been shown that for a particular emulsion, larger grains are on the average more sensitive than smaller ones.

In 1917 Hodgson³⁶ observed that there were preferred points on silver halide grains where development started initially. (See Plate II, Fig. 4.) These "sensitive centres" were shown later to be scattered haphazardly on grain surfaces. A theory of photographic sensitivity was proposed by Silberstein in 1922 which explained the developability of the grains as due to haphazard action on them of light which Einstein had previously conceived to be transmitted as discrete particles or "bundles" instead of continuous waves. Silberstein gave the name "light darts" to these light particles. Subsequent investigations³⁷ by Toy, Svedberg, Sheppard, Trivelli, and Loveland, discredited the idea of light creating one developable spot by the absorption of one "light dart" and showed fairly conclusively that there were sensitive nuclei preexistent to light action and whose presence was necessary for a high degree of sensitivity.* Since then Silberstein³⁸ has put in mathematical form a new theory which is independent of the nature of the light and depends upon the nature of, and change in, the sensitivity speck during exposure and development. This is based on the views of Toy, Sheppard, Trivelli and others that sensitiveness varies with the size and distribution of the specks preexistent to exposure.

Sheppard showed in 1925 (previously noted under *Manufacture*) that these nuclei were actual specks of silver sulphide resulting from the decomposition, during manufacture, of sulphur compounds in the gelatin. He also found that these compounds were not the only substances capable of forming sensitivity specks; in fact, he described similar effects rising from tellurium and selenium compounds. Various patents on these substances were taken out during 1927-28 by the Kodak Company and on other substances by German manufacturers indicating the practical significance of this discovery.

In 1925, Sheppard, Trivelli, and Loveland³⁹ suggested that light falling anywhere on the silver halide grain had its energy transferred to the nearest sulphide centre. In 1927 Trivelli⁴⁰ proposed a theory which provided a specific mechanism for this effect based on the knowledge that light causes silver halides to conduct electricity and that a potential difference exists

between silver bromide crystals and many foreign specks that might be contained in them. The theory assumes that the sensitive specks consist of both silver sulphide and silver which would act as the two electrodes of a battery. When exposed to light, the surrounding silver bromide acted as an electrolyte, decomposing so that the quantity of silver increased in size until sufficiently large to induce developability. Subsequently Toy,⁴¹ and later Kirillov,⁴² published experimental data which were in agreement with the theory.

Some progress has been made also in the study of the theory of development, the microchemistry of the action of various developers on the shape of the silver grains, the chemical nature of organic developers, and allied theoretical problems.⁴³

Bibliography. General reviews of photographic progress are published annually by the Society of Chemical Industry (British) under the title *Applied Chemistry Reports*, by the *British Journal of Photography* in their *Almanac*, and by the American Photographic Publishing Company in their year book called *The American Annual of Photography*. The more notable photographic books published since 1914 have been classified as follows:
History—*Quellen-Schriften zu den frühesten Anfängen der Photographie bis zum XVIII. Jahrhundert*, J. M. Eder (Halle, 1913); *Histoire de la Découverte de la Photographie* by G. Pontonnière, P. Montel (Paris, 1925); *Histoire du Cinématographie* by M. Coissac (Paris, 1925); *Centenaire de L'invention de la Photographie* (Paris, 1926); *A Million and One Nights—The History of the Motion Picture*, by T. Ramsay (New York, 1926).
General Photography—*Jahrbuch für Photographie*, J. M. Eder (Halle), Vol. 28 (1914), Vol. 29 (1915-20), Vol. 30 (1921-27), Paris I and II, *American Annual of Photography*, P. Y. Howe (New York), issued yearly 1914-26. Edited since 1927 by F. R. Frapprie (Boston, Mass.), *Agenda Lumière* (Paris). Issued yearly by the firm of Lumière, Paris, *Photo Miniature*, Tennant and Ward, New York. Issued at irregular intervals, usually several times yearly. Each issue complete about a specific subject. Nos. 129-202 incl. issued 1914-1928, *The Soviet Photographic Almanac*, edited by Soviet Photo Review (Moscow, 1928) Vol. 1, *The Fundamentals of Photography* by C. E. K. Mees (1920 4th ed. 1928, Rochester, N. Y.), *Photographic Facts and Formulas* by E. J. Wall (Boston, 1924), *The Dictionary of Photography* by E. J. Wall, edited by F. J. Mortimer, (11th ed. 1926, London), *VI Congrès International de Photographie (Proceedings)* (Paris, 1926), *Ausführliches Handbuch der Photographie* by J. M. Eder (Halle) vol. 1, 1925, 4th ed., vol. II, Pt. I, 1927, *La Technique Photographique* by L. P. Clerc (Paris, 1926), *Photography, Principles and Practice* by C. B. Neblette (New York, 1927); *Rezepte, Tabellen und Arbeitsvorschriften* by J. M. Eder (Halle, 1927); *The Complete Photographer* by R. O. Bayley (London, 9th ed. 1926), *The Production Process in the Photographic Paper and Plate Industry* by W. Dickfach (Stuttgart, 1927), *Photography* by A. Watkins, (London, 3d ed. 1927).
Development and Printing—*Le Négatif en Photographie* by A. Seyewetz (Paris 2d ed. 1922), *Die*

Standentwicklung by R. Renger-Patzsch (Leipzig, 1920), *Modern Development*, by F. R. Frapprie, (Boston, 1923); *Practical Printing Processes* by F. R. Frapprie, Boston, 1923), *Print Perfection* by B. T. J. Glover, (Liverpool, 1924); *Étude Pratique du Développement Lent* by H. Bourée (Paris, 1925), *Die Fehler im Negativ und im Entwicklungsdruck* by P. V. Neugebauer (Berlin, 1926), *Die Kopierverfahren* by E. Stenger (Berlin, 1926); *Perfect Negatives* by B. T. J. Glover (Liverpool, 2d ed. 1926); *Les Différentes Méthodes de Développement* by C. Duviol (Brussels, 1926).

Commercial and Studio Photography—*How to Make a Studio Pay* by F. Farrington (New York, 1914), *Theoria e Practica della Coloritura delle Fotografie* by R. Namias (Milan, 1914); *L'Art de Retoucher les Négatifs Photographiques* by C. Klary (Paris 1918), *Die Retusche von Photographie* by J. Grasshoff and F. Loescher (Berlin, 1918), *The Photography of Colored Objects* by C. E. K. Mees, E. K. Co (Rochester, N. Y., 9th ed., 1928), *The Commercial Photographer* by L. G. Rose (Philadelphia, 1920), *The Air-Brush in Photography* by G. F. Stine (Cleveland, Ohio, 1920), *Retouching and Finishing for Photographers* by J. S. Adamson (London, 1925), *Towles Portrait Lightings* by W. H. Towles (Philadelphia, 1925), *Photography as a Business* by A. G. Willis (London, 1928).

Photographic Chemistry—*Chimie Photographique* by H. Barbier and J. Paris (Paris, 1915), *Les Produits Chimiques Pours en Photographie* by C. Poulem (Paris, 1922), *Photographic Chemicals and Chemistry* by J. Southworth and T. L. J. Bentley (London, 1927), *Elementary Photographic Chemistry*, Eastman Kodak Company (Rochester, 1928).

Pictorial Photography—*Die Photographische Kunst* (Halle), an illustrated yearbook, *Camera Work*, Alfred Stieglitz (New York), an annual review of pictorial work, discontinued about 1920, *Pictorial Photography in America*, by the Association of Pictorial Photographers of America (New York), *Luci ed Ombre*, Il Corriere Fotografico (Turin), yearbook of Italian photography, *The Pictorial Annual of the Royal Photographic Society of Great Britain*, edited by F. O. Tilney (London), *Deutscher Kamera Almanach* (Berlin), review of pictorial work in Germany, *Photofreund Jahrbuch* W. Frerk (Berlin), *The A. K. S. Annual for Photographers*, edited by K. Takakura and K. Nakazima (Tokyo) *Japan Photographic Annual*, edited by K. Narusawa (Tokyo), *Photograms of the Year*, edited by F. J. Mortimer (London, reproductions of outstanding pictorial work, *The Appeal of the Picture*, F. O. Tilney (London, 1915), *The Fine Art of Photography* by P. L. Anderson (Philadelphia, Pa. and London, England, 1920), *Pictorial Composition in Photography* by Arthur Hammond (Boston, 1920), *Pictorial Landscape Photography* by the Photo Pictorialists of Buffalo (Boston, 1921), *How to Hunt with a Camera* by W. Nesbit (New York, 1926).

Optics—*Optics for Photographers* by H. Harting, (Boston, 1918), *A Simplified Method of Tracing Rays Through any Optical System*, L. Silberstein (London, 1918), *Optical Projection* by R. S. Wright, London, 6th Ed., 1920), *Optic Projection* by S. H. Gage and H. P. Gage (Ithaca, 1921); *Camera Lenses* by A. Lockett, (London, 1925).

Physical Measurements—*The Photographic Researches of Ferdinand Hurter and Vera O. Driffield* by W. B. Ferguson (London, 1920), *The Physics of the Developed Photographic Image* by F. E. Ross (New York, 1924), *Der Aufbau der Photographischen Bilden* by E. Goldberg (Halle, 1922). French translation (Paris, 1926), *Photographisch Photometrische Untersuchungen* by G. Eberhard (Potsdam, 1926), *Photographic Photometry* by G. M. B. Dobson, I. O. Griffith, and D. N. Harrison (Oxford Univ. Press, 1926); *Photometry* by J. W. T. Walsh (London, 1926), *La Sensométrie Photographique et ses Applications* by G. Moreau (Paris, 1928).

Photo Theory—*Photo Chemistry*, S. E. Sheppard (London, 1914), *Kolloidchemie und Photographie* by Lüppe-Cramer (Dresden, 1921); *The Silver Bromide Grain of Photographic Emulsions* by A. P. H. PHYSICS. Recent years have been eventful in physics, as the leading topics suggest: relativity, confirmed by crucial tests, partly supplementing Euclid and Newton; cosmic rays coming to earth from everywhere, with wave lengths, of great significance, atomic structure and its infra-cosmogony, crystal lattices—the newly found geometry of matter the wave atom and the wave election; the photo-electric cell—Aladdin lamp of science; super-voltage; the closing up of the 62-octave gamut of electromagnetic waves; the discovered rhythmic variation in the rotation period of the earth; the talking film and television; the synthesis of the methane series; positive ray spectiograph for weighing atoms; the beta-ray spectra measuring nuclear energies, the boiling of carbon and the freezing of helium; all three states are now attainable for all chemical elements, the production and recording of radio-echoes from the Kennelly-Heaviside layer of the atmosphere and long-period echoes suggested as coming from far beyond the atmosphere; these and other recent achievements are of epoch-making importance.

The discovery of X-rays, of the inert elements, the radioactive elements and the electron, the quantum, and relativity, inaugurated an unprecedented advance in physical science during the first quarter of the twentieth century. Any attempt prior to this epoch to supplement Newton's laws and Euclidian geometry with laws of superior rigor would have been deemed heresy. The quantum of Planck and the relativity equations of Einstein have won their way steadily to a commanding position, the one by the beauty with which it fits observed phenomena, and the other by the accuracy with which it predicts quantitatively phenomena contrary to those of classical mechanics. The one began as an empirical necessity, the other as a logical necessity both have been astonishingly successful in their agreement with certain observed phenomena of nature.

Relativity. The year 1915 was notable for the publication of Einstein's short but epoch-making paper on his generalized theory of relativity. This, with his paper published in 1905 on the special theory of relativity, has wrought the most profound advance in physics since Newton. The finitude of the material universe, the non-objectivity of time and space, the meaninglessness of absolute motion, the effect of gravitation fields on light and other radiant energy, the equivalent of mass and energy, the acceptance of time as a fourth coordinate, the introduction of the relativity effect of the finite velocity of light into physical equations—all these were so new to the physicist who had not followed the course of philosophical or mathematical theory that skepticism, even ridicule, greeted the new theory set forth by Einstein.

To demonstrate his theory, Einstein selected

three necessary results of his theory which might be tested by observation, each of them contrary to the classical laws of mechanics and inexplicable under classic physics. He even predicted these results quantitatively by the simple use of his relativity equations unmodified by special assumptions. The three predictions have now been confirmed by observations of unquestioned precision. The agreement is within about 1 per cent or better. Classic physics, based on Euclid's geometry and Newton's laws, was shown to have failed in crucial tests.

Testing the Relativity Theory. The first test of the relativity theory was the mathematical determination by relativity equations of the full value of the precession of the perihelion of the planet Mercury. The rotation is in the direction of motion of the planet and was inexplicable according to Newton's laws by an amount equal to 43 seconds of arc per century. The Newtonian failure was notable, small as it was. Using relativity equations without special assumptions, Einstein computed the true rate of rotation of the perihelion of Mercury to within one second of arc per century. His success was astonishing and furnished the first confirmation of his theory. The relativity effect on the apsis of Venus is too small to observe on account of its slight orbital eccentricity. The relativity effect of like character has been observed for the planet Mars, but observational confirmation of the exact amount must await fuller data.

A second triumph, even more spectacular, was the confirmation of Einstein's prediction that gravity affects light and that starlight passing the sun's disk at grazing incidence would be deflected on his theory by an amount twice the value to be looked for from classical theory. Maxwell long before had shown that light waves should exert pressure. Years later, experiment confirmed the prediction. It was only at a total eclipse that the stars could be photographed to test the theory that a gravitational field produces a curvature of space which gives a corresponding curvature to the path of a ray of light. If the photographic images of stars near the eclipsed sun during totality showed an apparent displacement away from the sun equal to that predicted by Einstein—double that called for by classical mechanics—it would be strong evidence for the relativity theory; but if the amount was one-half that predicted by Einstein, then Newtonian laws might account for the displacement as a simple effect of gravity on light.

Decisive success came on May 29, 1919, when at Principe light from near-by stars was found deflected $1.72'' \pm 0.11''$ by the sun, almost exactly equal to that predicted. In 1922, in the most careful eclipse observations yet made, Campbell found his observations, as finally adjusted, agreed within about one-half of 1 per cent of the Einstein prediction. The mass of Jupiter is great enough to produce a perceptible deflection and an occultation of a star by this planet may yet be a favored method of studying this phenomenon. Einstein's predicted deflection of light by the gravitational field of the sun was quantitatively confirmed by measurements just completed of the apparent positions of the stars photographed during the total solar eclipse of 1926. Einstein had said that a hundred experiments might support his theory, but that one proven adverse result would destroy it.

The third relativity prediction to be verified was that, in the gravitational field of the sun,

light waves would be lengthened—for example, about 0.008 angstrom unit for the blue light of wave length 4000 Å. The lengthening varies with the wave length. Grebe and Bachem, however, in 1920 reported that they had detected a lengthening equal to the recession of the light source 0.56 kilometers per second. A light wave in the sun was thus shown to vibrate at a slower rate than a similar atom on the earth.

Other observers found effects of the same order which made the determination difficult by masking the relativity shift. St. John found close agreement between predicted and observed shifts when such factors were carefully considered. For iron rays from the centre of the sun's disk, above the photosphere, the mean observed shift is .009, while .0091 angstrom is the computed Einstein shift for that position. Adams found an astounding shift in the spectrum of the companion of Sirius, many times that of the sun. On the basis of the known mass of that star, Eddington computed its size and density. The density reported was 50,000 times that of water, more than 2000 times heavier than the heaviest substance theretofore known. Adams in this astounding announcement confirms the last of the trio of the crucial quantitative predictions upon which Einstein was willing to rest the acceptability of his theory.

Chazy, in his *Le Théorie de la Relativité et la Mécanique*, issued in 1920, gives the evidence for accepting 42.9 seconds per century as the perihelion advance of Mercury, and 1.74 angular seconds for the deviation of light passing the sun at grazing incidence, both quantitatively predicted by Einstein.

Adams found that one remote nebula, 100 million light years away, showed an apparent radial recession of 2500 miles per second, nearly double that of any hitherto measured speed. The "crumpling of space," as deduced from general relativity, is the possible cause assigned by Adams for this "spurious velocity of recession." Shapley reports a proportionate effect predicted by relativity on nearer galaxies at 10,000,000 light years, about a tenth of the distance of the nebula reported on by Adams. Relativity thus seems to have additional confirmation in phenomena unknown until recent years.

Relativity was conceived because absolute motion could not be detected nor measured; that is, we have no means of telling in what direction we are moving, nor how fast. The ether-drift experiment is therefore crucial. Early experiments gave negative results. After a carefully planned research at Mt. Wilson, D. C. Miller reported that his results showed a relative motion of the earth and the ether at Mt. Wilson observatory, equal to nine kilometers per second, about one-third of the earth's orbital velocity. Tomasehek, at heights from 120 to 3457 meters from observations which would have detected an ether-to-earth relative velocity of 20 meters per second, obtained only negative results. Meinur found that the ether-drag calls for a density gradient of 5 to 1 for the ether-from-earth to the point where the drag is zero, and concluded this to be unlikely. Lodge regarded the partial drift as a minute residual, and doubtful. Miller replied that the effect is always present and cannot depend upon the instruments or their surroundings.

Thirring denied the cosmic cause and attributed the displacements to local disturbances. The matter reached a more settled stage when Michel-

son himself announced the negative results of his extended series of experiments at Mt. Wilson for detecting the ether drift. Even with highly sensitive apparatus, the results showed no displacement as large as 2 per cent of that expected if, as Miller suggested, the solar system moves through space 300 kilometers per second. The result is profoundly significant for the tenability of the relativity theory. Michelson announced that while he accepted Einstein's relativity, he still believes the existence of the ether is necessary for light-wave phenomena.

The abstract mathematics used to enunciate Einstein's theory were such that few physicists could follow the reasoning. The verification, however, of three predictions contrary to classic mechanics could be comprehended by all but could be ignored by none.

Whittaker holds that relativity requires the entire rewriting of electromagnetics, even though such essays as Weyl and others have made must be modified or abandoned. Einstein himself objected to his own 1915 field equations of gravitation, since a solution was possible with an empty universe. His "cosmological term" introduced to avoid this proved to have a solution in the so-called "De Sitter world" in which all minor irregularities are smoothed out resulting in a manifold of constant curvature, the simplest example of which is the surface of a sphere. Einstein has developed equations for electricity and gravitation identical in form, which may indicate a remarkable unification in the direction aimed at by Weyl.

The actual dimensions of the universe are derived from star measurements, interpreted by the implication that the lines of the spectrum of a very distant star are displaced proportionally to the ratio of the distance of the star to the constant radius of curvature of the universe.

In the words of Planck, Einstein's theory "surpasses in boldness everything previously suggested in speculative philosophy and even in the philosophical theories of knowledge" and that "the revolution introduced into the physical conceptions of the world is only to be compared in extent and depth with that brought about by the introduction of the Copernican system of the universe."

Heyl confirmed the isotropy of crystals with respect to a gravitational field. With highly accurate weighings, he found no variation as much as one-billionth part in the weight of crystals weighed in various orientations. This confirms the correlation of gravitation with inertia which Einstein suggested. Heyl's determination of the constant of gravitation is now nearly completed. From the observations already computed, the provisional value is 6.664×10^{-8} .

Cosmic Physics. Confirmation continues to come in as to the effects of solar cycles of the sun-spot period upon terrestrial conditions. Koppen proves that the temperature of the earth's atmosphere in the tropics is 1.1°F . warmer when the sun-spots are most frequent. This temperature rise increases the evaporation and lowers the level of the tropical lakes in Africa. How the effect works out is not fully known, but the fact is undoubted. The work of Douglass in correlating the tree-ring growth with the climatic cycles and the sun-spot cycles adds further proof. So well advanced is this correlation that the particular years in which a tree was planted and cut down can often be deciphered from the characteristic pattern of the curves of ring-growth sequence. Petrified forests may yet dis-

close prehistoric weather cycles and tell much regarding solar radiation in geologic times. The subject is fascinating. Every lumber camp becomes a potential solar and terrestrial weather observatory, and every tree has its tale to tell of the sequence of weather changes through which it grew.

Douglass describes observations of cloud formations taken from an airplane including record of temperature within the cloud and the surrounding air and the dimensions of the cloud formation. A new field is now open for airplane work in collecting data with suitable autographic instruments.

Jeffrys accepts the tidal theory of the origin of the solar system, showing that mere condensation could not produce the system. His results agree well with the age of the earth as determined by its radioactive constituents. He also shows that no satellite less than 1000 kilometers could have been gaseous, since the mass could not hold itself together in gaseous form. He assumes that the asteroids were formed from a primitive planet broken up by the tidal action of Jupiter.

Solar physics is the object of particular study among other things, on account of the correlation which Abbott and others are establishing between solar variations and terrestrial meteorological phenomena. Angenheister finds the sun hotter at sun-spot maxima. These show strong vertical movements, cooler layers sinking, hot masses rising, increasing the radiation. Jupiter and Encke's comet vary in brightness with the sun-spot cycle, the maxima coinciding. Evidently, factors other than temperature at spot maxima cause the striking 11-year cycle in tree-ring growth. Mean air temperatures are at least one-half degree lower at spot maxima. The influx of cool air from higher latitudes is greatest at spot maxima, as shown by the records of the winds at Samoa. Trade winds at that point appear to be 10 per cent more frequent. The frequency of cirrus clouds also parallels the spot cycle. The air at spot maxima absorbs 0.05 calorie per square centimeter less per minute and the mean temperature of the earth drops a fraction of a degree. Abbott, Fowle, and Aldrich give 1.94 calories per square centimeter per minute as the solar constant, based on 20 years' observations.

The variable rotation of the earth was the startling headline of the announcement by Boss that the systematic errors in right ascension are attributable to a secular change in the rate of rotation of the earth. The change appears to be periodic with a period of 80 years and a cumulative total drift of 40 seconds in this time. The rhythms are diurnal, monthly, annual, duplicating the three chief tidal forces acting upon the body of the earth. That a gradual shortening of the mundane day is occurring has long been believed, but that the day rhythmically lengthens and shortens in turn is a surprise. The significance is that our unit of time is changing and that it may be necessary to find a clock more constant than the changing earth, perhaps in the frequency rate of cadmium-red radiation.

Brown reports a correlation between the frequency of British earthquakes and the differences between Greenwich observation and occultation times, and he attributed the change in the length of the day to internal causes, equivalent to radial variation of five inches if the whole earth is involved, or of 12 feet if a crust of only 60 miles thickness is concerned.

Boss attributed the measured variation in the

day to the swelling and shrinking of the earth and correlates the change with variations in the rotation rate and earthquake frequency. *Nature* reports that tidal friction has increased the terrestrial day .0025 second per century during the past three centuries. The tidal drag on the earth is computed to be equal to a billion and a half horse power. A rhythmic increase and decrease about the mean value also occur, not, however, exceeding .0036 second deviation from the mean.

The earthquake of June 25-26, 1924, with origin 500 miles south of Australia, was perhaps the most fruitful in seismological history, for it proved that the iron ball (about 4000 miles in diameter) which forms the heart of the earth has a sharply defined spherical surface.

The age of the earth has been determined by the ratio of radioactivity end-product lead to the uranium content in uraninite, yielding a value of between one billion and one billion, three hundred million years since the ocean beds were formed. The result is found by using the rate of lead formation from uranium to measure the length of time the uranium has been disintegrating.

It is characteristic that unsuspected indicators of phenomena are found in this interchange of scientific thought. Estimates of the age of the earth are based upon the atomic lead and its percentage in uranium ores. Knowing the rate per year at which the lead is accumulating from the final stage in the disintegration of uranium atoms, the age of the ore is readily computed. The figures check with good concordance with the age of the earth as estimated by six other methods. Apart from its unique interest, the method is capable of effective use in geological theory.

That the mass of radiation which causes its pressure is not a mere abstraction of academic interest only is seen in the theory of giant stars and the powerful rôle which radiation pressure plays in the architecture of stellar evolution and especially in limiting the growth of mass to approximately 10^{35} grams, the mass at which radiation pressure begins far to exceed the inward pull of gravitation. Practically all the visible stars are between 10^{35} and 10^{34} grams, where ether pressure of the soft X-rays just begins to dominate the situation. Knowing the mass, it becomes possible to tell what stage of its evolution it has reached.

In the days of Laplace, gravitation was assumed as the only building force of the cosmos. About the middle of the nineteenth century, the pressure of light was postulated from theory and later confirmed. In the heart of a star, the pressure of light is now known to sustain most of the vast weight of the star's mass.

During the eclipse of 1922, it was found that the sun's atmosphere was being driven away from the sun with a speed that increased steadily. Such an increase could be due only to an accelerating force constantly at work. This force was promptly recognized as light pressure. The same effect was observed when Halley's comet was seen to disrupt, a small portion of the head breaking off. The power momentum and smaller size of the detached particles caused them to be driven away from the sun relative to the head of the comet. Gravitation and the pressure of radiation are now recognized as jointly determining the architecture of stars and stellar systems.

Eddington estimates the density of interstellar matter at 10 hydrogen atoms, or 1.66×10^{-23} gram, per cubic centimeter as the upper limit.

This gives a mean free path (assuming ions with average atomic weight 20) of 10^8 kilometers, with a year interval between collisions, and for electrons 5.2×10^8 kilometers with collision intervals of 10 days. This gives a Maxwellian distribution. The black-body temperature of a body in equilibrium with starlight is only 3.2° absolute. At $10,000^\circ$, condensation of matter begins to form a nebula, rise in density and temperature drop cause high opacity which holds the heat formed; at a certain stage, the density becomes high enough to enable radiation from sub-atomic processes to be scattered and this makes a further source of heat.

Michelson has obtained the first measure of the diameter of a star—alpha Orionis—the bright-red star, Betelgeuse, of magnitude 0.7 in the constellation of Orion. The result is startling, for it gives a diameter 300 times that of the sun, or a volume 27,000,000 greater. He later found that alpha Scorpionis—Antares—had a diameter 500 times that of the sun or a volume 125,000,000 times greater. The principle is to admit the starlight by two parallel slits in the field of the telescope. The diffraction pattern formed depends upon the distance apart of the slits. For each size of star disc, there is a definite distance apart for the disc at which the diffraction pattern disappears owing to the optical interference effect in the waves forming the two sets of diffraction fringes. By adjusting the slits until this occurs and measuring the distance apart, the angular diameter of the star disc is computed simply by multiplying the wave length used by 1.22 and dividing the distance apart of the slits.

"Invisible sun-spots" were studied by Hale and Ellerman. Beginning with the theory that the normal type is the "twin bipolar," 970 spots showed the percentage of bipolar spots to be 61 per cent. In seeking companions for single spots, local magnetic fields were discovered near the spots. The first such field discovered had the polarity and position usual for the following component of a regular bipolar pair. In several cases, invisible fields gave rise to spots and, in cases where spots had disappeared, traces of magnetic field were still detected. If the vortices of a bipolar group penetrate deep enough, they must certainly unite to form a half-ring.

Astronomy and Physics. Astronomy in turn has gained, as well as given, in its contact with physics. Belot holds that of the forces which dominate attraction in the architecture of the universe, gravitation blends all into one mass. The dispersive forces prevent agglomeration, such as molecular attraction, gas pressure, radiation pressure, electrical and electromagnetic forces. Crystalline growth operates against gravity, as do many other forces of growth, but attraction does not produce the primitive dispersive impulse. Attraction ensures stability, but the architecture is the resultant of all the incident forces.

A large-scale example of light pressure observed by Bell is shown in Saturn's rings. These rings are thin strata of bodies of meteoric size, surrounded and permeated by dust invisible except through deep layers. This dust is wind driven by gravitation and the pressure of radiation which moves the particles back and forth through the sunlit side and may be seen below when light filters through. The acceleration due to solar radiation is, for particles of micron size, nearly 350 kilometers a day, a demonstration of Maxwell's theorem on a colossal scale. According to modern physics, the mass of all stars rests

upon radiation pressure. For example, 95 per cent of the mass of sun is supported by the radiation pressure of the intense X-rays generated in the heart of the sun under gigantic gravitational pressures.

Solar Physics. Jeans computed that the sun loses 3.8×10^{33} ergs per second, losing mass at the rate of 4.2×10^{12} grams per second, such mass becoming radiant solar energy. It has been estimated, on this basis, that the sun's total radiant energy would give, at one cent per kilowatt hour for the sun's power output, a value of a billion dollars each billionth of a second. Words are rare to find as eloquent as those of Jeans before the meeting of the International Astronomical Union. Speaking of the physics of the sky he said, "We are realizing more and more that what the astronomer is really doing, to a large extent, is the carrying out of the study of physics and chemistry on an heroic scale. His laboratory is the open vault of heaven with dimensions to be measured in millions of light years. Hung up in that vault are millions of crucibles in which matter is maintained at temperatures ranging from a few thousands to many millions of degrees. In those crucibles, the solution of the problem of the ultimate structure of matter is demonstrated innumerable millions of times every second. There the dream of the alchemist comes true and the elements are transmuted one into another. Nature provides the apparatus and the materials and carries out the experiments; all we have to do is to record and interpret."

Structure of Matter. In 1919 an event of truly strategic importance in physics was Rutherford's success in breaking down the positive nucleus of the lighter atoms. Using the alpha particle (helium) from radium C, Rutherford had a projectile with a velocity of 19,000 kilometers per second; 20,000 times that of a rifle bullet. He had available in a single particle a stress-producing energy of 5 kilograms of weight at the closest approach to the nuclei encountered. The momentum at the high velocities is such that a gram of helium at such velocity would have a striking energy equal to that of a 300-ton projectile at a velocity of a kilometer a second.

With this projectile, he bombarded hydrogen atoms, and in some encounters between the alpha particles and the hydrogen, a head-on collision occurred, in which the momentum of the former was transferred to the latter, giving it a range four times that of the alpha particle. This was quite in accordance with theory. Unexpectedly, however, in pure nitrogen, the particle produced ranges as long as those produced in pure hydrogen. As the nitrogen atom has several times the weight of the helium atom, by control experiments, he eliminated all explanations except that the nucleus of the nitrogen atom had been broken up by the swift alpha particle and a hydrogen nucleus detached from the nitrogen nucleus.

The long-range atoms were detected by absorbing screens of metal which stopped the alpha particles but permitted the higher speed hydrogen atoms to pass to the scintillating screen. In any case, a new method of research has met with success and for the first time the positive nucleus has by intent and under control broken up. Other light atoms have yielded to similar bombardment.

Harkins and Shadduck discuss the synthesis

and disintegration of atoms as revealed by their photographs of Wilson cloud tracks. Thirty-four thousand photographs (total atom paths exceeding 400,000) were made showing alpha tracks in nitrogen. Two-thirds were 8.6-centimeter, and the rest were 4.9-centimeter, ranges. Fast alpha particles from thorium C attach themselves to nitrogen nuclei, forming fluorine momentarily. The ejection of a hydrogen atom then changes the atom to oxygen—the three tracks, fluorine, oxygen, and hydrogen, all lie in one plane. Results of great interest were obtained by these and other experimenters. To catch the infinitesimal atomic nuclei on the wing, with bullets moving 12,000 miles a second and transmuting the elements by the impact, is surely a glimpse of a coming technique which will give new power to the physicist.

Rutherford finds that alpha particles (helium nuclei) may be captured by atomic nuclei in collisions which eject a proton. The length of path of the proton and of the recoil nucleus are in harmony with this view. The alpha particle would increase the nitrogen nuclear mass from 14 to 18, and its charge from 7 to 9, decreasing each by 1, leaving the mass 17 and the charge 8 (isotope of oxygen).

The positive-ray spectrograph of Thomson, Goldschmidt, Dempster, and Aston projects and deflects the positive parts of atoms or molecules after disruption, so that they leave traces on the photographic plate at distances which indicate their mass. This measures not only the masses of different elements, but the variant masses of atoms of the same element. Neon atoms of mass 20 and 22, in the ratio of 9 to 1, were detected. The elements have been studied and the isotopes of each weighed ballistically with an accuracy of 1 part in 15,000, disclosing the packing fractions for slight variation from whole-number atomic weights.

The first verification of Prout's hypothesis of a common building material, the whole-numbered multiples of which constitute the elemental atoms, was achieved in 1915, based upon the thoughts of Crookes, Soddy, and others, who had suggested that the usual atomic weights are not fractional, but average weights of variant atoms. Atoms of the same element which differ in mass are isotopes occupying the same place in the atomic system, and having the same identical behavior. Atoms of different elements may have the same weight and different behavior; for example, lead and bismuth atoms resulting from thorium (disintegration) have the same atomic weight, 208, but display then characteristic elemental behavior notwithstanding. Positive-ray analysis resulted also in the discovery of undissociated groups of atoms, radicals, and molecules unknown before. The method is a powerful research tool for the physicist.

Soddy has summarized transmutation in radioactive changes, the disintegration of radioactive material, ultimate products, radiations, average life, branch series, and chemically nonseparable elements. He concludes that radioactive changes are quite distinct from the usual chemical changes. Perrin notes that chemical reactions are accelerated by rise in temperature, being doubled in rate for each 10-degree rise. The reaction at this rate would be 10 billion times faster for each elevation of 300 degrees; but the radium disintegration remains absolutely unaffected by any such change of temperature. In spite of recent attempts, it appears to be im-

possible at present to affect the rate of radium disintegration. Heat, light, magnetic field, high concentration, or extreme dilution produce no effect on the rate. The alpha particle is ejected with prodigious speed, 20,000 kilometers per second from the radioactive atom. This particle is the nucleus of the helium atom (mass 4) but radon, the residual product, recoils with a velocity of several hundred kilometers per second. The alpha particle passes through 100,000 aluminum atoms before it is stopped. The initial energy of such a projectile is more than a hundred million times greater than that of a molecule in ordinary thermal agitation.

Atoms. Hundreds of notable names suggest themselves as adding to the steady stream of atomic knowledge which formed the atomic theory. Faraday discovered the law of electrolysis; Berzelius had developed his electrochemical theory; and Arrhenius, the theory of electrolytic dissociation. Then came Lenard, J. J. Thomson, Crookes, and others concerned in disclosing the electron itself as a discrete entity. Curie found radium from which electrons and helium nuclei were ejected and gave a dynamic example to the physicist of the disintegrating atoms. Soddy advanced the thought, foreshadowed by Crookes, that the atoms might vary in weight, even for the same element, and examples were afforded in radioactive transformations. Variant-weight atoms of the same element were called isotopes. Thomson and Aston perfected the means of studying them and the latter provided proof that the atoms, except hydrogen, usually had integral atomic weights.

At this juncture, Planck's quantum theory became, in 1900, an essential factor in the field of radiation. Balmer, Rydberg, and Ritz had given an equation for computing the spectral lines of the Balmer series. The outstanding question remained: Why were specially favored frequencies alone possible, say, in the Balmer series of hydrogen? On classical assumptions and electrodynamic theory, no explanation was forthcoming. Planck found complete agreement on the assumption that the energy of the vibrating electrons could not change continuously but always in whole numbers of what he called "energy-quanta." Thus, Planck's constant took its place as the factor which, multiplied by the frequency, gave the energy quantum. This latter relation was pointed out by Einstein, who based upon it his theory of the photoelectric effect. Not yet, however, was it possible to reconcile interference phenomena with the theory of quanta, and it is just such phenomena that reveal the meaning of the frequency thus computed.

Bjerrum's prediction, verified by Eva von Bahr, that rise in temperature would cause spectrum lines to split up into discrete components, became a vivid proof of the reality of the quantum. Then came Rutherford's development of Rutherford's suggestion and Nagaoka's theory that the nucleus of the atom would be found to be positive, since the electrons were negative. We can fairly attribute the establishment of this fact to Rutherford in the year 1911.

In 1913, a young physicist at Copenhagen, Niels Bohr, attempted the final step of postulating certain conditions which might account for the stability of atomic structure and the properties of radiation from the atoms in accordance with the observed relations. The essence of this is that certain favored orbits alone could exist and that these bore such relation to each other

that the radii are proportional to whole numbers. For simplicity, suppose these represented by circles. The favored series within which alone stability existed were circles having radii $1^2, 2^2, 3^2, \dots, n^2$. An electron might jump only by whole-number intervals. No radiation takes place while an electron is moving in one of these orbits. If an electron jumps from one of these to another, the difference in energy is equal to Planck's constant times the frequency.

Bohr borrowed from astronomy the concepts of orbits. He showed that for hydrogen the spectral series (Balmer, for example) could be computed from theory, assuming Coulomb's law and the discrete stable orbits (nonradiating). For example, the hydrogen alpha line of the Balmer series of hydrogen represents a release of energy equal to the difference between the energies of the third orbit and the second orbit having equivalent radii, respectively, 3^2 and 2^2 , or equivalent ellipses of similar energy content. The characteristic of the Balmer series is that the orbit of arrival is No. 2, the orbits of departure being, respectively, 3, 4, 5, 6, \dots, n, \dots theoretically, on to infinity. Naturally, the electron fall from infinity to orbit No. 2 would give the maximum energy release—just equal to the ionization potential. The latter is the voltage required to give electron speeds sufficient to drive an electron from an atom permanently. The ionization potential becomes one of the great basic constants affecting not only spectroscopic theory, but all chemical reaction as well. If the ionization potential is divided by the Planck's constant (6.555×10^{-27} ergs) the result is the frequency of the shortest wave emitted by the atom in the Balmer series. Such, very simply, was Bohr's theory. It has had much brilliant supporting evidence, notably the work of Sommerfeld, in accounting for the fine structure of the spectral lines in 1916.

In 1914, Lyman discovered the series in which the orbit of arrival was orbit No. 1. Paschen had long before found the spectral series, for which the orbit No. 3 was the orbit of arrival. In 1922, Brackett observed several lines of the series terminating in the fourth orbit. The simplicity of the theory may be stated thus: all emitted or absorbed radiation is produced by change of orbit. For hydrogen, the difference of the inverse squares of the orbit numbers gives the ratio of their frequencies. A falling electron emits, a departing one absorbs, energy. The mathematical treatment of the hydrogen orbits is now relatively simple. Such treatment of the helium orbits is still impossible, except for special cases of assumed structure. The problem of three bodies (hitherto insoluble) now assumes great importance in the further study of the atom and its spectra.

Epoch making for atomic physics of the year 1926 is the spinning electron. Pauli showed that each electron has four quantum numbers, no electron in a given atom having all four numbers like those of any other electron. Uhlenbeck and Goudsmit conceived the fourth degree of freedom might be rotation. The idea was a happy inspiration. In spite of difficulties, the spinning electron is now part of atomic theory. It seems to account for the ratios of magnetic moment to angular momentum, optical and X-ray doublets, anomalous Zeeman effects, and so on. The last is a triumph of the new atomic mechanics. The fine structure of hydrogen, empirically proposed, is closely accounted for by in-

ternal spin. Not only points of accord, but those of divergence as well, lend strength to the new mechanics.

Three independent systems give illuminating insight into the quantum concept. Born, Heisenberg, and Jordan use the Hamiltonian system, in which the coördinates are matrices rather than series. Each element in a matrix is identified with a transition between two stationary states of the old theory, with an imaginary exponential factor determining the frequency, and the amplitude factor determining the probability of transition. Schrodinger's wave equation is the latest form seeming to be even more powerful than the matrix mechanics. He uses energy levels as the characteristic value in an equation which Eekhart shows accords with the matrix method, in which each element can be expressed as a volume integral. The new mechanics gives automatically details which were hypotheses in the old quantum theory. For example, the new dynamics incorporates logically and simultaneously both frequency and intensity. The Bohr frequency condition follows naturally from quantum conditions in the Hamiltonian form. It gives the quantum shift, spectroscopic stability, and the selection principle. The new mechanics gives different energy values only where the old were not in accord with experiment.

If a free electron is considered a fluid with a resonance frequency, this implies that the free electron is attended by a wave train going in the same direction as the electron with wave length dependent on its speed. An experimental discovery of the utmost significance is that of Davison and Germer, who find that free electrons are actually found to behave like wave trains, diffrangible by crystals and carrying their electrons wherever they are diffracted. A suggestive analogy is the system of resonance of a vibrating box full of air. It may be recalled that Lodge long ago pointed out that the radial variation of the natural period frequency of a vibrating circular disc follows a law—the equation of which resembles and suggests the radial inverse frequency relations of the Bohr atom. Generalizing de Broglie's theory that corpuscles are accompanied by waves, G. P. Thomson also concluded that electrons should have a wave system. Thomson's experiments actually show that such waves produce diffraction rings when electrons pass through a gold film. Motions of pure point-charge electrons would not produce such waves. The electron behaves like a group of waves whose velocities and wave lengths depend on the speed and mass. For electrons falling through 25,000 volts, he computed the electron wave length as 0.75×10^{-9} centimeters, about that of hard X-rays. He obtained Laue crystal-lattice patterns from electrons sent thus through films of aluminium, gold, and platinum.

Crystals. The progress in crystal structure analysis has been remarkable. The beautiful X-ray patterns formed by the space lattices of crystals disclose the distribution of the atoms in the crystal. The significance of crystal-lattice methods today is that it is possible to study the fundamental fine structure of crystals as carefully as once we studied the external form. Amorphous solids have been likened to an orchestra at practice, each musician playing the same tune, but at different points in the piece; but in single crystals, the atoms, like the players, all play the same piece at the same place in

the piece, so that at once the harmony and melody are apparent. Something like this is the view of the crystal gazer of today who allocates the ions and atoms in space configuration to form the geometrical figures characteristic of crystals.

The crystal structure appears to depend upon the number of outer electrons, the crystal-lattice pattern being of the same type for any given column of the periodic table. Crystal structure thus becomes a periodic function of the atomic number, as are the other properties of the elements. As a result of the determination of the intracrystal orientation of the atoms, the crystal forms arrived at suggest simple and natural explanations of certain physical properties of these substances. Aluminium and other face-centred cubic arrangement of atoms (an atom at each angle and at each face-centre) are soft and ductile. The reason is simple. There exist four planes in such cubes in which the atoms are so closely packed that one plane slips easily over the one below without elevating it, hence with minimum changes in the attractive distances between the atoms. Less ductile are the body-centred cubic metals (an atom at each angle and one at the cube-centre) since they are more fully interlocked and the interatomic attractive distance must change during gliding. This group includes such metals as iron and tungsten. The correlation of crystals is thus throwing new light on the behavior of the metals.

The hardness of the diamond is quite naturally attributable to the tetrahedral arrangement in which gliding is impossible since the atoms in this type are interlocked in the most stable manner. Shore has found that the diamond under good conditions can support a load of two million pounds per square inch. Hull states that simple cubic salts, such as lithium fluoride and sodium chloride, do not permit gliding since the atoms are bound electrostatically, each ion being surrounded by six opposite charges.

The study of lattice energies, both theoretically deduced and experimentally observed, is actively under way. Space-lattice studies have been made on the large organic structures such as cellulose, rubber, and the complex carbon group compounds. A notable study is the space-lattice and molecular chain model for ramie fibre structure (cellulose) in which Sponsler and Dore are enabled to give with the most minute detail the location of all the atoms, and account for the fibre structure itself as a natural outcome of the structural relations.

The methods developed for crystal analysis seem capable of disclosing the distribution of every atom, ion, or molecule—perhaps of the elections themselves in solids. Laue patterns give us a means of studying such inner crystal structure just as the spectra have enabled us to analyze the detail structure of the atom.

Applied Physics. Applied physics is today well illustrated by Allen's achievement in giving the "versatile vacuum tube" the rôle of micrometer caliper and scale. The device on Wheddington's principle is a resonant circuit tuned by change of capacity of one or two condensers. It is used to control the thickness of manufactured paper. Varying amounts of material will change the electrostatic capacitance, and alter the current through the meters. The electric micrometer has become a useful research tool. Rotating shafts have shown by this means vibrations as

small as one ten-thousandth inch. The U. S. Bureau of Standards built an improved electric linear micrometer sensitive to a motion of one-billionth of an inch.

Hardy devised a recording color analyzer which, with an integrating device, computes automatically the color-sensation values while the spectrophotometric curve is being traced.

The arrival of television for the people is signalized by the fact that essential elements for the reception of television are on the market at low prices and that several firms are broadcasting regular programmes. Laboratories are busy developing the new art which in 1928 reached the broadcasting stage. The first demonstration of perfected television by wire, developed under Dr. Ives and his chief, Dr. Jewett, was made between New York and Washington. See TELEVISION.

Quite as astonishing is the feat of applied acoustics displayed in Wensley's televocal system by which operatorless machinery is controlled by human voice, so that the spoken words, "Open sesame," and no other combination of sounds will cause a certain door to open by a system of selective sound-sensitive relays. It is possible thus, also, to start or stop machines, open or close switches, or perform any other operations at will. Limitless controls are thus made possible by "televox," which may fairly be called epoch making.

Coblentz has greatly improved the sensitivity of his star-heat apparatus, which would respond to the heat of a candle at a distance of several hundred miles.

The New English *Journal of Scientific Instruments* is issued by the Institute of Physics in co-operation with the National Physical Laboratory. Science is recognizing the basic importance of instrument design and construction. Instruments make possible discoveries which otherwise could never be made. They accelerate, sometimes hundreds of times, the rate of gathering precise data. We may soon expect some physicist to do science the great service of writing a stimulating account of the place of the instrument in physics. This would doubtless inspire scientists and instrument makers alike in the production of new types of apparatus for experimental use. The *Journal of the Optical Society of America* has established an instrument section and added to its name the words *Scientific Instrument Review*. Hitherto, *Instrumentenkunde* has held the field unrivaled. America, now in the instrument field in full earnest, will surely take a high place in developing not merely new technical, but new scientific, instruments as well, designed and built upon the most advanced scientific data and theory. American ingenuity is already in evidence in the later catalogues. Examples may be found in almost every branch of physics and applications in almost every branch of industry. In fact, the present tendency toward the completely measured control of industrial processes is almost without a parallel. Accurate temperature and heat controls are now established in scores of industries. In many cases, high temperatures are maintained automatically at predetermined values. The combustion of fuel is now automatically regulated in modern steam plants by apparatus which continuously and automatically corrects the air supply, so that the CO₂ content in the flue gases is kept at an optimum percentage.

There are many examples of the instruments used by the physicist becoming tools of industry. Applied science is rapidly transferring the methods and principles and apparatus of the physicist into control instruments for the measured guidance of each part of the industrial process. In electricity, the advance from the laboratory to practical uses has been rapid and steadily increasing. Electrical devices in endless variety are being developed for regulating the production, distribution, and utilization of heat, light, and power. Light buoys are being electrically equipped with selenium cells so that, when the sky reaches a prescribed minimum brightness, the buoy is lit automatically. Automatic heat control and humidity control are being extended to almost all kinds of manufacturing operations. The indoor atmosphere of schools and theatres is being conditioned by devices first used in the conduct of physical research.

Airplane engines are tested in altitude chambers where the conditions of high altitudes are duplicated. Testing laboratories are equipped with standard rooms having prescribed humidity and temperature, so that the results may be comparable and standard. The vacuum tube has developed into a powerful engineering tool capable of sending messages to all parts of the world. In short, the variety of scientific devices developed by the physicist and transplanted to the industries is too great to enumerate. The scientific journals and the latest instrument catalogues must be consulted for details which cannot be touched in this general survey.

Sound. The faintness of radiotelephone sounds even at moderate distances led to the development of amplifying electron tubes. The uses of electron tubes are unique in the annals of invention and are in a state of rapid development at this moment. Their design and construction command exacting theoretical and experimental physics. Research engineers have developed the amplifier which can magnify sound trillions of times. In fact, to the point where their volume cannot be endured and where structural materials would collapse if the sound were continued. Ives radio-vision transmission required 5000 million million fold amplification. The microphone is now supersensitized and, connected to an amplifier, permits the human heart-beat to be heard across the ocean.

Jewett has announced that it is possible both to transmit and to amplify by radio without distortion. There remained the final step, now being taken, to perfect the reproduction of sounds at the receiving end without distortion. The amplification of the inaudible sounds of the insect world, too faint or of too high a frequency to be normally heard, opens up the dramatic possibility of vastly extending aural perception much as the microscope and telescope and camera have extended our vision to the infinitesimal, and the infinitely remote.

The study of "sound spectra" of musical instruments awakened an interest which should soon be fruitful in practical application. This analysis gives the respective wave lengths and relative intensities of the simple sounds component of any musical note revealing quantitatively the causes of the characteristic quality of the sounds of musical instruments.

Hearing in three dimensions, by analogy with binocular vision, has excited scientific experimenters in radio. By broadcasting on 68 meters

for one ear, and on 237 meters for the other ear, using properly placed microphones and ear phones, a remarkable effect is produced as of hearing with both ears in a room, orienting to the perception the sound sources in all directions. If the transmitting microphones are six or seven inches apart, like the ear of the listener, normal impressions of space orientation of the source result.

Loomis and Hubbard, using super-sonic waves and a sonic interferometer, determined sound velocity through liquids, finding, for example, that sound waves travel through pure water at 60° F. at a speed of 4850 feet per second. The production of high-frequency ultra-sonic waves has awakened recent interest through the work of Wente on the electrostatic transmitter, of Hewlett and his electrodynamic oscillator, and Hartmann and his air-jet oscillator. Woods and Loomis produce such rays by use of a quartz oscillator. Loomis and Harvey show that super-sonic waves may be studied under the high-powered microscope.

Interesting effects of high-frequency supersound are reported, some of them attributed to heat effects. Burns are caused when the vibrating glass thread is held between the fingers. Small organisms like frogs and paramecia are killed; benzol is atomized into a fine mist; emulsions otherwise impossible may be produced; and dust figures of great delicacy and beauty are formed. Exploratory researches are planned for possible practical uses of short-wave supersound, in both science and industry.

Applied acoustics had great opportunities in the World War. It was active notably in the production, transmission, and reproduction of sound, exemplified notably in the use of acoustical devices for detecting enemy planes, locating enemy batteries, and discovering sappers at work underground. Huge parabolas used as reflectors with sensitive sound receivers detected planes approaching Paris 30 miles away. Apparatus was promptly devised to locate enemy batteries with high precision. Sensitive geophones effectively disclosed enemy mining, and sound ranging was developed to a point where the length of the type of gun had to be taken into account, so accurate was the location of enemy batteries by sound-wave triangulation. Battle firing permitted the study of sectors of sound, and speeds of concussive sounds were measured as high as three kilometers per second and pressures as great as 300 atmospheres. The gradient was so steep that, 30 meters from the sound source, the speed dropped to 400 meters and the pressure to two or three atmospheres.

At Munich, the technical physicist is already studying vibrations in connection with mechanism with a view to enhance efficiency in the transmission and use of mechanical power. The possibilities of utilizing resonance are just beginning to be adumbrated. Every object, every cavity has its natural period of resonance-wave forms. Such forms may be complex. Atomic physics is largely the study of rhythms and resonances. In fact, the new wave atom may almost be described as a bundle of rhythms and resonances.

As yet, the entire field, from earthquakes to the still imperceptible oscillations of the insect world, are in an empirical, even legendary state. With the supermicrophone and amplifier, the study of the sound spectrum of a given object or cavity set in vibration or resonance becomes

possible. Any characteristic tone is thus reproducible by giving the harmonics their proper relative intensities. The field is thus wide open for the creation of a harmonic synthesizer capable of reproducing sounds of any possible tone quality or frequency.

Physical research has perfected the phonograph to the point where the distinction between the original rendering and the reproduction from the shellac disc is difficult or impossible. Astonishing developments in this field have resulted from the application of acoustical physics, theoretical and experimental, to radio. The talking-film is another triumph of applied acoustical physics.

Electricity. Sheppard announces a process for electroplating rubber direct from the latex on a suitable material, such as wire, cloth, wool, or sheet metal. Ammonia is added with the ingredients needed to make the rubber usable. The ammonia adds negative charges to the colloidal rubber of the latex. The particles readily absorb the needed ingredients, so that milling is entirely eliminated and a better product results. The rubber particles have a negative contact potential of .035 volt and a mobility of 2.7 microns per second. Thick deposits may be built up, since they are permeable, and fillers, added as colloidal suspensions to the latex, may be deposited with the rubber.

The diffusion of physical methods is revolutionizing the sciences, as well as the industries. Some examples will illustrate. The photoelectric cell is already in widespread use—classifying products by color, recording sound waves without distortion, translating the printed page directly into musical chords identifiable by the blind, transmitting pictures by radio and by wire, measuring the light of the stars and planets, and making television possible. By a polarization method, Johnsrud measures films of metal rubidium as thin as one atom to ascertain at which thickness the photoelectric current produced was a maximum. The purpose is to construct photoelectric cells of the utmost responsiveness. The maximum effect was found with films one atom thick.

Feussner, showing the relation between atomic number and electrical conductivity, points out that the alkali metals show a maximum conductivity notably in cesium and rubidium, in which one electron circulates in the orbit group just formed. There are also maxima for Cu, Ag, and Au. Copper and nickel have identical electronic structure except that, in copper, one electron has been added in a new $4s$ orbit system.

A theory of ferromagnetism based on atomic magnetostriction confirms the ideal quality of permalloy. Magnetization is found to alter the size of a specimen by a few parts in a hundred thousand, heating the metal, wasting energy as hysteresis loss. Iron lengthens, while nickel shortens, in the direction of the magnetic axis, so that a rightly proportioned alloy should show no magnetostriction. So it proves. The easy magnetization of permalloy seems due to the conspiring of iron and nickel atoms to make their magnetic changes in harmony, avoiding shock and energy loss, to which iron and nickel are separately subject.

Honda holds that ferromagnetism is caused by high-speed electronic revolutions in the nucleus of the atom. Radioactivity shows that such intranuclear electrons exist, revolving with nearly

the speed of light. His computed values for the magnetic moments of the iron atom, 2.4×10^{-20} , is close to the observed value and the observed facts of ferro-, para-, and dia-magnetism follow from his theory.

Breit and others in Washington secured (1925) excellent photographs of received "radio echoes" from the Kennelly-Heaviside layer. Discrete radio impulses were sent and recorded a few miles away. The recorded trace is accompanied by a follower satellite trace of each impulse. The satellites are the reflections from the Kennelly-Heaviside layer, 100 miles up, as confirmed by the fact that the follower satellite trace was 001 second after the main impulse was received.

A new cathode-ray high-speed camera automatically records lightning flashes, the surges of which reach a maximum in 10 millionths of a second. Boys shows that a lightning discharge may start from ground and cloud at the same time, meeting in mid-air.

Breit and Tuve, using a Tesla oscillator in oil under high pressure, have produced 5,200,000 volts for research on the atomic nucleus and high-frequency radiation in the hard X-ray and gamma-ray range. The production of 5,000,000 volts, the maximum at this writing, foreshadows the attainment of artificially produced voltages equal to those of natural lightning. Model villages are now being experimentally struck by artificial lightning under measured control to study protection from lightning. In General Electric researches, artificial lightning has been produced at a tension of 3,500,000 volts.

Before the National Academy of Sciences in 1928, Crile gave his experimental results on excitation, exhaustion, and death in terms of physical constants, showing that when the cell potential difference becomes zero, death ensues. This is an extension of his remarkable work in support of his bipolar theory of living processes, which applies equally well to the potential difference between the positive-atom nucleus and the negative electrons around it, to the positive-cell nucleus and the negative cytoplasm around it, and to the potential difference between bodily organs.

The epoch-making achievement in 1924 was the closing of the gap in the continuity of the gamut of electromagnetic waves from two billionths centimeter (gamma wave lengths) to 60 kilometers (radio wave lengths) and over. This was done most ingeniously by Nichols and Tear, who produced electric waves a millimeter in length. Glagolewa-Aikadiewa of Moscow, with a unique device, produces waves one-fifth millimeter long.

Light. Ives revived interest in the firefly, stating that if the light of the firefly were spread over the entire visible spectrum, it would still excel many times the efficiency of an artificial light source. It will be recalled that Coeblentz found that the luminous equivalent of radiant energy was about 50 candles per watt. The "least mechanical equivalent of light," as determined in 1915 was 00163 watts per lumen for the monochromatic green radiation of the mercury arc (wave length, 6461). Ives later found the value .001605 watt/lumen. Colorimetry, for which physicists such as Priest, Gibson, Ives, and others are laying basic principles, is fast taking a high place as an exact science.

Harvey has completed the first big step toward the production of artificial light from organic materials after the manner of animal light production. He obtained one candle power

from 30 square inches of luminous solution of luciferine. Dubois and Harvey have extracted "luciferose and luciferine," two substances supposed to cause animal light. Luciferine emits no light on agitation, but luciferose bursts into a momentary brilliancy if shaken. When mixed, the two substances emit continuous light, apparently requiring oxygen or moisture.

Waidner and Burgess proposed that the unit of light be defined in terms of blackbody radiation at the temperature of melting platinum. Ives found this value to be 554 candles per square centimeter, believed to be accurate to within $\frac{1}{4}$ per cent. The U. S. Bureau of Standards is now engaged on the problem of realizing this unit with high accuracy.

The modified scattering effect is a notable recent discovery. Monochromatic light impinging on a gas, fluid, or certain solids, gives rise, viewed transversely, to polarized wave lengths not in the incident beam but spaced symmetrically on both sides of the spectral exciting line. Many have studied the effect. Ramsden found the effect in ether vapor, Langer, in water; Brickwedde and Peters, in carbon tetrachloride. Raman found that the modified spectrum of monochromatic light diffused by fluids is a powerful and precise method for exploring molecular spectra in the infra-red. For example, the mercury-4358 line gives in carbon tetrachloride three new frequencies corresponding to three computed (but previously unknown) infra-red lines in the carbon-tetrachloride spectra.

It appears that Landsberg and Mandelstan had detected changes in wave length when light is scattered by some transparent media, anticipating the first note by Raman on the subject. German workers report that the characteristic basic vibration of the C-H group at 3.3 microns can be found superposed on the incident light by all compounds tested. Not all infra-red rays give rise to modified scattering, but all such modified lines from organic liquids can be referred to known infra-red vibrations. Venkateswaren's results on modified scattering show that the transformation of monochromatic rays into general or white radiation is caused by the special state of molecular aggregation giving high viscosity. Morton adds that a wide glycerin band suggests that the broadening out of the modified lines to bands is caused by the OH group.

The continuous spectrum of the zodiacal light was photographed by Ramdas and showed prominently the 4227A absorption line of calcium. He obtained no record beyond 5000A suggesting that the scattering is from matter in atomic or molecular state, and believes that the Raman modification of the light may account for the apparently weak polarization and special character of the zodiacal light.

Cosmic rays have been studied for 15 years, at first by Hess, then by Kolhorster, later by Millikan. Jouncey and Hughes recompute the range of wave lengths to be between 2.4 and 3.2 milliangstroms. After extensive observations and computations, using Einstein's mass-energy equation, Dirac's absorption equation, and Aston's positive-ray measurements, Millikan and Cameron conclude that cosmic rays seem to result from the creation from hydrogen "in a single step" of such elements as helium, oxygen, silicon, and perhaps iron, in interstellar space. Their observations in the Andes show that cosmic rays are independent of geographical position.

At sea level, thunder storms did not affect the cosmic-ray action, namely the production of 1.4 ions per centimeter per second. No excess was observed from the Milky Way, as compared with the plane perpendicular to it. Using Compton's formula, the wave length varies from .525 to .32 milliangstroms.

Rutherford points out that X-rays from radium have a quantum equivalent of 4,000,000 electron volts; that the total quantum from the helium-hydrogen transformation is 27,000,000 electron volts, and the proton itself represents an equivalent of 940,000,000 electron volts. The absorption coefficient of the most penetrating rays, deduced by Millikan and Cameron, agrees with the Klein-Nishina relativistic form of wave mechanics for a quantum of 940,000,000-volt energy dissipated from the transformation of the internal energy of the proton into radiation. A billion-volt transformation would thus account for the highest frequency ultra-penetrating rays observed.

Meggers, Kiess, Catalan, Sommerfeld, Russell, and others have aided in unraveling the secret of atomic structure through furnishing the metrics of energy levels and transitions. Each spectrum line represents the transition of one electron from one energy level to another. The energy difference of the two is the energy quantum of the spectrum line.

Bohr himself, on the basis of spectra and other considerations, published a summary of the electronic distributions in each atom of the periodic system. Later, Stoner and Mainsmith gave a revised distribution similar to Bohr's, but in closer agreement with experiment. Kossel in 1916 developed the idea, and G. N. Lewis and Langmuir postulated statcal equilibria, of the tetrahedral atoms of column IV, and cubic configuration for those of column VIII, of the periodic system. Valency on this view is positive, and negative for each atom, the sum being 8, and is the number of electrons either furnished or needed to complete the outer electron octet.

The astonishing linearity of the X-radiations of the K and L orders enabled the prediction of the existence of Atom 72, and its subsequent discovery in zirconium and titanium ores, and its isolation in quantity. This new element was named by its discoverers "Hafnium" after the ancient name for Copenhagen (Copenhavn). Workers in the atomic field are many, and the detailed works are found in the physical journals, for the subject is of outstanding interest in science, full of promise for epoch-making discoveries.

Birge states that "the energy levels associated with the valence electrons of molecules agree in all respects with those associated with the valence electrons of atoms," thus clearing the way for the great field of molecular spectra with its evident possibilities. That the problem is not easy is evidenced by the fact that the neutral nitrogen molecule has more than 50,000 lines in its known band spectra. Spectra, then, are a potent tool in the study of the energy and structure of atoms and molecules. The eccentricities of the elliptical orbits appear to give rise to the so-called principal, diffuse, sharp, and fundamental series in conjunction with the principal quantum number (row number of the periodic system). The work of Catalan, Meggers, Walters, Kiess, and Russell, and many others carried the analysis of special frequencies and frequency relations into the most difficult ele-

ments of the period system—the so-called long periods.

The impact of electrons at controlled speeds has become a means of throwing light on the energy required to change the state of energy of the atom and experimentally checking up the magnitude of the spectral terms. Frank, Foote, Mohler, and others have done notable work in this direction.

In 1914 Stark discovered a remarkable splitting up of the hydrogen lines when subjected to an electric field. Two years later, Schwarzschild and Epstein accounted for this effect and in 1917 Sommerfeld and Debye worked out the explanation and details of the Zeeman effect on the basis of Bohr's theory of atomic orbits. In 1922 Stern and Gerlach split a stream of atomic silver by a magnet into two streams, showing that the single outer electron of the silver atom in its rotation makes each atom an electromagnet and, when passing a sharp-edged magnetic pole, it is repelled by like pole or attracted by the unlike pole, making the two streams as graphic demonstrations of the Bohr theory. Later, the newer mathematical attacks upon the atomic problem assumed the central position to supplement the Bohr picture and give mathematical solutions where it permitted none on account of the limitations imposed on the solutions of orbital systems of three or more bodies. At this writing, like the wave and quantum theories of light, the wave and planetary theories of the atom are in the field, one useful for its ease of mathematical handling, the other for its graphic picture.

The importance of "available energy" is stressed by Lotka in a study of the energetics of evolution. He refers to Boltzmann's principle that the fundamental objective contention in the life struggle in the evolution of the organic world is available energy. The advantage in the struggle goes to those whose energy-capturing devices are most efficient in directing available energy into channels favorable to the preservation of the species. Intra-atomic energy, now well measured and vast, is accepted by physics as a fact of profound significance for future experiment. Four grams of hydrogen atoms exceed by three centigrams the helium produced, corresponding, according to Einstein's formula, to the liberation of 7×10^{12} calories. It is wise to face the possibility of the synthesis by inciting exothermic combination of hydrogen atoms into helium atoms. Young experimenters, who tomorrow will hold the field, may be stimulated by the possibilities which this and other atomic reactions present.

Physics has been so productive in the period under review that only a few of the more important researches can be even named. It could be spoken of as almost the golden age of the physicist with super forces and mechanisms at his command. The immediate future presages discoveries of far-reaching kinds. Fortunate is that physicist who sees the inspiring view of the re-creation of the world by the sciences touching the cosmic essence we call energy, the tangible aspect of which we call matter.

The literature on the new physics is growing so rapidly that any list would be out of date before reaching the reader. The journals report advances and are reviewed more thoroughly by *Chemical Abstracts*, *Science Abstracts* (physics), and the various technical indexes. For the latest books in this prolific field, consult current

numbers of *Science, Nature, and Science Progress*. See CHEMISTRY.

PHYSIOLOGICAL CHEMISTRY. See BIOCHEMISTRY; FOOD AND NUTRITION.

PICARDY, BATTLES IN. See WORLD WAR, *Western Front*.

PICASSO, pé-käs'só, PABLO (1881-). A Spanish figure and genre painter who resides in Paris (see VOL. XVIII). Regarded as the leader of French Cubists, his work after 1917 became increasingly neo-classical, stressing form rather than motif. Outstanding among his later works were *La famille au suage*; *La Mort de l'arlequin*, and *Femme et enfant*. See PAINTING, under *France*.

PICCIRILLI, pèt'ché-rél'è, ATTILIO (1866-). An Italian sculptor residing in the United States (see VOL. XVIII). He designed one of the pediments of the State Capitol at Madison, Wis., and the war memorial for the city of Albany, 1923. He was awarded a gold medal at the Panama-Pacific Exposition in 1915; the Widener Gold Medal of the Pennsylvania Academy of Fine Arts, 1917; the Salsus Gold Medal of the National Academy of Design, 1926; and the Ellin P. Speyer Memorial Prize of the National Academy of Design for his "Seal" in 1929. His brother, **FURIO** (1868-) (see VOL. XVIII), in 1920 executed the entire sculptural decoration of the Parliament House at Winnipeg, Canada.

PICKETING. In 1914, the Congress of the United States passed the Clayton Act which, among other things, provided that no restraining order may be granted by any Federal court or judge to prohibit labor, singly or in concert, from peacefully persuading others to work or to stop work or from attending any place where they may lawfully be. Labor regarded this as the opening of a new era in which the right of peaceful picketing would become generally recognized and accepted.

Prior to 1914, there were laws in only two States—Alabama and Colorado—making picketing a misdemeanor. Beginning with 1915, however, several States took vigorous action. Washington enacted a law making picketing a misdemeanor. Texas followed with a sweeping act which provided that anyone who in conversation or otherwise with a person engaged in transport and commerce, or with any member of his family, at work or at home, attempts to cause him to desist from work through fear of violence is deemed guilty of intimidation. A Nebraska law made practically any form of picketing unlawful, including persistent communication with a man's family. Hawaii also enacted a strict law against picketing. Utah, in 1923, passed a law against use of force, threats, intimidation or violence, but an earlier law of 1917 limiting injunctions, forbids any injunction from interfering with peaceful persuasion. Wisconsin, in 1923, liberalized a law against picketing, which involved intimidation, by specifically allowing peaceful persuasion to be carried on outside the working premises during the strike or lockout.

Meanwhile, picketing cases found their way frequently into the courts. In some States, all picketing was condemned, as in Oregon and Washington decisions of 1917. In other States, the right of peaceful picketing was held to be lawful, as in Arizona, Indiana, Minnesota, and Montana decisions of 1916 and 1917. However, not only in directly deciding against picketing but also in indirectly limiting its practice

through definition, the courts have, as a general thing, rendered decisions against labor.

In 1922, the United States Supreme Court, in *American Steel Foundry v. Tri-City Central Trades Council*, upheld the provisions of the Clayton Act permitting peaceful persuasion but attempted to draw the line between legal and illegal acts in a way that would considerably limit picketing. The American Steel Foundry decision has been generally held as authority for the proposition that peaceful picketing may be lawful and that it is the duty of the court to examine all the facts in each case and determine and definitely prescribe what conduct is permissible under the particular circumstances presented.

One of the most sweeping blows that was struck at picketing was the injunction secured in 1922, and made permanent in 1923 by the Federal court in Chicago, against the Railway Shop Crafts strike. The attorney general brought this action on behalf of the United States on the ground of protecting the United States mails and interstate commerce. Although the Clayton Act authorizes peaceful persuasion, nevertheless this injunction, in addition to the customary prohibition of violence, intimidation, and unlawful picketing, restrains peaceful picketing and persuasion, argument and entreaties, newspaper interviews and the use of union funds "in aid of or to promote or encourage the doing of any of the matters or things heretofore restrained and enjoined." The terms of this injunction against picketing, however, drew vigorous criticisms in decisions of other Federal courts in cases arising out of the railway shopmen's strike, particularly in Montana and North Dakota, where the full right of peaceful persuasion was reaffirmed.

Wholesale arrests of pickets at factory gates continue from year to year. Legislation to curb the employers' use of the police and courts in this connection is frequently proposed. Dramatic instances of violence in connection with picketing shocked the public during the textile strikes in North Carolina in 1929.

PICKFORD, MARY (MRS DOUGLAS FAIRBANKS) (1893-). An American actress, born in Toronto, Canada. She made her stage debut at the age of five and her first marked moving-picture success in *Hearts Adrift*. She returned to the stage in *A Good Little Devil* and then devoted herself to the screen. Among her successes are *Tess of the Storm Country*, *Cinderella*; *Pancho-Cricket*; *Madame Butterfly*; *The Bishop's Carriage*, *Rosita*, *Pollyanna*, *Rebecca of Sunnybrook Farm*, *Poor Little Rich Girl*, and *Little Lord Fauntleroy*. In the later "talkies," she made her debut in *Cocktyle*. She has been one of the most popular screen actresses in the United States.

PICK-MANGIAGALLI, RICCARDO (1882-) An Italian composer, born at Strakonitz, Bohemia. He was trained at the Milan Conservatory under Appiani (piano) and Ferroni (composition). His earliest works were written under the influence of Wagner and Strauss, especially in regard to the handling of the orchestra. Later, the influence of the French impressionists made itself felt. His most important works are the ballets, *Il Salve d'Oro* (Milan, 1914); *Il Carillon Magico* (ib., 1918; New York, 1920); *Mahit* (ib., 1923); *Sumitra*, and *Casanova a Venezia* (Milan, 1928); a symphonic poem, *Sortilegi*; *Preludio e Rondo Fan-*

tastico; two preludes for orchestra; a string quartet; and several pieces for piano. An opera, *Basi e Bote*, was produced in Rome (1927).

PICRIC ACID EXPLOSIVES. See EXPLOSIVES.

PIERCE, GEORGE WASHINGTON (1872-). An American physicist, born at Webberville, Tex., and educated at the University of Texas, Harvard and Leipzig. In 1903 he became instructor in physics at Harvard, in 1917 full professor of physics and director of the Cruft Laboratory there and in 1927 chairman of the division of physical science. During the World War, he conducted experiments at the Naval Experimental Station at New London, Conn. Among his more important researches were his experiments in resonance in wireless telegraph circuits and crystal rectifiers for electric currents and electric oscillations. In addition to many papers contributed to various scientific publications, he is author of *The Principles of Wireless Telegraphy* (1910) and *Electric Oscillations and Electric Waves* (1919). He is a member of the National Academy of Sciences and other learned societies.

PIEZO-ELECTRIC OSCILLATORS. See RADIO TELEGRAPHY.

PIGMENTS. See LEAD.

PIGOU, ARTHUR CECIL (1877-). A British economist, educated at Harrow and King's College, Cambridge. He lectured in economics at University College, London (1903-04) and at Cambridge (1904-07) and became professor of political economy at Cambridge in 1908. He was a member of the committee on currency and foreign exchange (1918) and of the Royal Commission on Income Tax (1919). In 1927 he was made a fellow of the British Academy. His works include *The Riddle of the Tariff*, *The Principles and Methods of Industrial Peace*, *Protective and Preferential Import Duties*, *The Policy of Land Taxation*; *Wealth and Welfare*; *Unemployment*; *The Economy and Finance of the War*; *Industrial Fluctuations* (1926), and *A Study in Public Finance* (1928).

PILES, SAMUEL HENRY (1858-). An American diplomat. He was born in Livingston County, Ky., and trained in private schools at Smithland, Ky. In 1883 he began the practice of law at Snohomish City, Washington Territory, removing to Seattle, Wash., three years later. He was city attorney of Seattle and assistant district attorney for the counties of King, Kitsap, and Snohomish, Wash. He served a term as United States Senator from the State of Washington (1905-11). Since 1922 he has been Minister to Colombia and he was special ambassador for the Colombian presidential inauguration of 1926.

PILES. See FOUNDATIONS.

PILOT CABLE. See NAVIGATION.

PILSUDSKI, JOSEPH (1867-). A Polish general and administrator, first Marshall of Poland (1920), who was born in Zulow of Lithuanian parents and educated at Kharkov University. In 1888, because of accusation of complicity in a plot against Alexander III, he was banished to Siberia, and on his return to Poland in 1892 he joined the Social-Democratic Party. In the World War, he commanded the 1st Polish Legion against Russia, resigning in 1916 because of trouble with the Austrian commanders. Later he was arrested by the Germans and imprisoned at Magdeburg. When he returned to Poland in 1918, he found the Government weak. November 14, the Council of Regency abdicated,

and Pilsudski, backed by his army, then held supreme power, being President of the new Polish State from November, 1918, until December, 1922. During 1919 Paderewski was Premier and Pilsudski was engaged in wars with the Ukrainians, the Czechoslovaks, and the Bolsheviks. The next two years were stormy, and after he was forced out of the Presidency he was chief of the General Staff for a short time. On May 12, 1926, a *coup d'état*, after several days fighting, made him virtual Dictator of Poland. He refused to accept his election as President, but became Minister of War, and in October also Premier, ruling Poland for two years. During a severe illness in May, 1928, he lost his majority block in Parliament, and on attacking his cabinet for permitting this, most of its members resigned. He followed their example on the following day (June). He then became Minister of War in the cabinet of Bartel. See POLAND, *History*.

PILTOWN MAN. See MAN, PREHISTORIC RACES OF.

PINCHOT, GIFFORD (1865-). An American forester and public official (see Vol. XVIII). In 1920 he was appointed Commissioner of Forestry of Pennsylvania. He was nominated for governor in May, 1922, by the Progressive wing of the Republican Party in the State and was elected in the following November, serving until 1927. During the threatened anthracite coal-miners' strike in 1923, Governor Pinchot drew up a plan of settlement which was accepted by both miners and employers. During the early part of 1923, he took an aggressive stand in regard to prohibition enforcement and severely criticized President Coolidge and the administration for alleged laxity in the enforcement of the law. He was defeated as delegate to the Republican National Convention in May, 1924, and as candidate for the Republican nomination for United States Senator in 1926.

PINE BLISTER RUST. See PLANTS, DISEASES OF, FORESTRY.

PINE SHOOT MOTH. See ENTOMOLOGY, ECONOMIC.

PINERO, pi-nâi'ô, SIR ARTHUR WING (1855-). A British dramatist (see Vol. XVIII). Throughout the World War, he was chairman of the United Arts Rifles. His later plays include *The Big Drum* (1915); *Mr. Livermore's Dream* (1917); *The Freak: an Idyll of Suburbia* (1918); *A Scat in the Park* (1922); *The Widow of Wasdale Head* (1924); and *A Private Room* (1928). Clayton Hamilton edited *The Social Plays of Arthur Wing Pinero* (4 vols., 1917-22).

PINK BOLLWORM. See ENTOMOLOGY, ECONOMIC.

PINTNER, RUDOLF (1884-). An American psychologist, born at Lytham, England, and educated at the Edinburgh University and the University of Leipzig. In 1912 he removed to the United States and was for several years on the faculty of the Ohio State University. In 1921 he became professor of education at Teachers College, Columbia University. He was the author of several books on psychology, including *The Picture Completion Test* (1917); *A Mental Survey* (1918); and *Intelligence Testing* (1923). He also translated several books on psychology.

PIRANDELLO, LUIGI (1867-). An Italian author and dramatist, born in Girgenti. In the United States, he was best known by *Six Characters in Search of an Author*, played in New York in 1922, where *Florian's Wife* was

staged the following year. Other plays include *Liola* (1917); *Così e' asc vi pare* (1918, trans. 1922); *Tutto per bene* (1920); *L'Innesto* (1921, trans. 1923); *Enrico IV* (1922, trans. 1922); *Vestire gli ignudi* (1923, trans. 1923); *La vita che ti diedi* (1924); *La nuova colonia* (1925), and *L'amica delle moglie* (1927). In 1928 translations of *The One-Act Plays of Luigi Pirandello*, edited by A. Livingston, appeared, and a new Italian edition of his many short stories was begun in 1921, 12 volumes having been published by 1928. He also wrote the novels *L'Isclusa* (1901); *Il fu Mattia Pascal* (1905, trans. 1923); *I vecchi e i giovani* (1923, trans. 1928); *Si Gira* (1916, trans., 1927), and *Uno, nessuno e centomila* (1919). His few volumes of poetry include *Mal Giocondo* (1889) and *Fuori di chiari* (1912). His critical work, *L'umorismo*, appeared in 1915. Consult *Italian Sketches*, by Ruth S. Philips (1924) and *Luigi Pirandello*, by Walter Starkie (1926) and F. Pasini, in *Italian* (1927).

PIRQUET, pĕr'kâ', CLEMENS, BARON VON (1874-1929). An Austrian pediatricist (see VOL. XVIII). During the World War, von Pirquet devised a new notation for nutrition, intended to improve on the calory. The unit is termed the *nm*, representing a cubic centimeter of mother's milk. He published *System der Ernährung* in 1917, with an addendum in 1920, devoted to this idea. He assisted the American Relief Administration in the work of feeding starving Austrian children during post-war years. His nutrition unit facilitated the utilization of the food supplied by the relief organization. In 1922 appeared in English *An Outline of the Pirquet System of Nutrition*. His death was self-inflicted.

PIRRIE, pĭr'ĭ, WILLIAM JAMES, FIRST BARON (1847-1924). An Irish shipbuilder (see VOL. XVIII). During the World War, he was of valuable service to the British government as commercial adviser to Lord Derby, and in March, 1918, he was appointed Controller General of Merchant Shipping. When the North of Ireland was separated from the new Irish Free State, he was one of the first senators elected to the Parliament at Belfast (1922). Lord Pirrie was created a viscount in 1921.

PITCHBLEND. See RADIUM.

PITHECANTHROPUS ERECTUS. See ANTHROPOLOGY.

PITT, PERCY (1870-). An English conductor and composer, born in London. He studied under Reinecke and Jadassohn at the Leipzig Conservatory (1886-88) and under Rheinberger at the Akademie der Tonkunst in Munich. In 1896 he was appointed organist at Queen's Hall; in 1902, coach at Covent Garden; in 1906, assistant conductor; and after Messenger's resignation (1907), principal conductor, a post which he filled until 1914. In 1920 he became principal conductor of the British National Opera Company. In 1927 he was appointed musical director of the British Broadcasting Corporation. His works include a symphony; *Le Sang des Crépules*, symphonic poem; *Anactoria*, a symphonic poem for viola and orchestra; *Ballade*, for violin and orchestra; an overture, *The Taming of the Shrew*; *English Rhapsody*, *Oriental Rhapsody*, *Fêtes Galantes*, *Cinderella*, *Dance Rhythms*, *Coronation March*, for orchestra; incidental music to Phillips' *Paolo and Francesca*, Austin's

Flodden Field, and Shakespeare's *Richard II*; *Hohenlinden*, ballad for male chorus and orchestra; *Swerting the Saxon*, cantata; *Sakura*, ballet-pantomime, and chamber music, piano pieces and songs.

PITTMAN, Key (1872-). A United States Senator (see VOL. XVIII). He was re-elected to the Senate from Nevada in 1916, 1922, and 1928. In that body, he has been a member of the committees on foreign relations, interstate commerce, irrigation and reclamation, mines and mining, public lands, and territories and insular possessions. He was Democratic caucus candidate for President pro tempore of the Senate for four successive Congresses. In the Democratic National Convention of 1924, Senator Pittman was secretary of the platform committee and in the convention of 1928, he was chairman of that committee.

PITTMAN ACT. See SILVER.

PITTSBURGH. A city of Pennsylvania. The population increased from 533,905 in 1910 to 594,297 in 1920 and to 673,800 in 1928, by estimate of the Bureau of the Census. The population of the metropolitan district of Pittsburgh, or Allegheny County, was estimated in 1926 to be 1,297,800. The area of the city was increased by the annexation of Spring Garden in 1920 and Chartiers in 1921; a zoning ordinance was adopted in 1923. In June, 1929, a referendum on the adoption of the metropolitan-charter plan, whereby the surrounding boroughs and townships of Pittsburgh would become part of a municipality covering 725 square miles, was defeated. In 1919, \$21,996,000 was voted for municipal improvements, as follows: highways, including the Boulevard of the Allies overlooking the Monongahela River, \$9,579,000; subway, \$6,000,000; parks and recreation grounds, \$1,815,000; water works, \$1,401,000; sewerage systems, \$1,314,000; public health, safety, and charities, \$1,110,000; highway bridges, \$750,000. Between 1919 and 1926, four of the bridges across the Allegheny River were rebuilt in accordance with the order of the U. S. War Department that they be altered to afford greater underclearing for navigation.

Two subway projects were also undertaken on the recommendation of the city transit commissioner. One was to connect the South Side district with the East End, chiefly by elevated tracks, a distance of 7.28 miles, at an estimated cost of about \$7,000,000, the other was to connect the North Side with the East End, mostly by subway and tunnel, at a cost of about \$11,000,000. In 1923 the Liberty Tunnel, a twin vehicular tunnel 5715 feet long extending under Mt. Washington and connecting the South Hills district with the business section, was completed at a cost of nearly \$6,000,000. In 1928 a bond issue of \$1,500,000 was approved for the construction of a municipal airport.

The school properties of Pittsburgh are valued at more than \$38,000,000. The large high-school buildings erected since 1916 include the Schenley, Langley, South Hills and Westinghouse high schools. A new administration building for the Board of Education was constructed in 1928 at a cost of \$960,000. In 1927 the city of Pittsburgh had 1620 industrial establishments employing 78,138 persons; the value of products manufactured was \$513,425,500. The same year, Allegheny County had 2577 industrial establishments employing 197,231 persons; the value of products manufactured was \$1,519,478,900. Building per-

mits issued in 1928 were valued at \$40,254,060, an increase of 8.3 per cent over 1927. Among Pittsburgh's notable new buildings are the Rowland & Clark Office Building, Plaza Office Building, Grant Building, Law and Finance Building, Koppers Building, American State Bank Building, Montefiore Hospital, Presbyterian Hospital, Pittsburgher Hotel, Roosevelt Hotel, Pittsburgh Press Building, and the Cathedral of Learning of the University of Pittsburgh. The clearings of Pittsburgh's 79 banks in 1928 amounted to \$9,452,672,000. The assessed valuation of property in 1927 was \$1,108,842,000; the net debt was \$116,470,000.

PITTSBURGH, UNIVERSITY OF. A nonsectarian coeducational institution of higher learning at Pittsburgh, Pa., founded in 1787. The university increased its enrollment with great rapidity between 1914 and 1928, from 2830 in the former year to 9960 in the latter. The faculty was increased in the same period from 329 to 851 members and the library from 20,000 to about 115,000 volumes. Productive endowment in 1928 amounted to \$1,708,402. The annual budget in the same year was \$3,622,768, while income from the legislature of Pennsylvania was \$414,799. Alumni Hall was built through gifts of the alumni in 1920. In 1925-26 a five-year college-dental-school course was opened, the length of the course for the Ph.D. degree in the College of Pharmacy was increased from two to three years, the department of economics was transferred from the college to the school of business administration, and the department of geology from the school of mines to the college. During 1924-25, \$6,303,399 was given for the "Cathedral of Learning," a skyscraper building to contain all the university's departments; by bequests from Mary O'Hara Darlington, income amounting approximately to \$1,000,000 was made available for a Darlington Memorial Library to house the general university library and the Darlington Collection. The children's hospital, the first unit in the medical centre, was completed, at a cost of \$1,500,000; and an athletic stadium costing \$2,100,000 was dedicated. In 1926-27 a department of fine arts was established; the division of research in higher education was organized; a total of \$2,600,000 was subscribed for the Presbyterian Hospital Unit of the medical centre; and the establishment of a junior college at Johnstown, Pa., was effected. In 1928, various other extension centres were organized; \$750,000 was received for the Falk Clinic; \$50,000 from Elbert H. Gary to establish a scholarship; \$210,000 for building purposes from Gardiner Steel, and \$90,000 for general endowment from David L. Gillespie. Chancellor, John Gabbert Bowman, LL.D.

PIUS XI (ACHILLE RATTI), POPE (1857-). He was born in Desio, Italy, and studied at the diocesan seminary and at the Lombard College of Rome, where he obtained a doctor's degree in theosophy, theology, and common law. He was ordained priest in 1879 and was professor of dogmatic theology and sacred eloquence in the seminary of Milan from 1882 to 1888, when he joined the staff of the Ambrosian Library, of which he became head in 1907. In 1914 he was appointed prefect of the Vatican Library. He went to Poland as Apostolic Visitor in 1918, in the following year became Papal Nuncio, and titular Archbishop of Lepanto, and in 1921 Cardinal Archbishop of Milan. In 1922 he succeeded Benedict XV as Pope. He made concordats with

Latvia (1922), Bavaria (1924), Poland (1925), and Lithuania (1927). In 1925 he received daily the many pilgrims brought to Rome by the 220th Jubilee year, and in the same year, he proclaimed the Feast of the Kingdom of Christ for the last Sunday in October. By far the most important event was the signing on Feb. 11, 1929, after over two years of negotiations, of a treaty with Italy, which was part of a larger Concordat, ending the 59-year imprisonment of the Pope, and making him temporal Sovereign in "Vatican City." See ITALY, History, and ROMAN CATHOLIC CHURCH.

PIZZETTI, ILDEBRANDO (1880-). An Italian composer, born at Parma, Italy. After receiving his first instruction from his father, he entered the Parma Conservatory in 1895 and graduated with honors in 1901. In 1909-18 he taught composition at the Instituto Musicale in Florence, when he succeeded Tacchinardi as director. In 1924 he was called to succeed Galignani as director of the Milan Conservatory. He wrote the operas, *Gulietta e Romeo*, *Le Cid*, *Debora e Jael* (Milan, 1922), *Fra Gherardo* (Milan, 1928; New York, 1929); incidental music to Sophocles's *Edipo Rè* and d'Annunzio's *La Nave*, *Fedra*, and *La Pisanelle*; *Requiem*, in memory of King Humbert; *Poema Emiliano*; *Orcitura per una Farsa Tragica*, *Sinfonia del Fuoco*; *Lamento*, for tenor and orchestra; a violin sonata, a cello sonata, and a string quartet; and piano pieces and songs. He also wrote many essays for various periodicals, a biography of Bellini (1916), and *Intermezzi Critici* (1921).

PLAGUE. See BUBONIC PLAGUE; INFLUENZA.

PLANCK, plank, MAX (1858-). A German physicist (see VOL. XVIII). He was professor at the University of Berlin from 1889 to 1923 and director of the Institute for Theoretical Physics there. He received the Nobel Prize for physics in 1919 and the Copley Medal in 1929. His later publications include *Die Entstehung und bisherige Entwicklung der Quantentheorie* (1920); *Vorlesungen über die Theorie der Wärmestrahlung* (1921), and *Einführung in die theoretische Physik* (1921-26). See PHYSICS.

PLANT QUARANTINE. See ENTOMOLOGY, ECONOMIC; HORTICULTURE

PLANTS, DISEASES OF. An annual plant-disease survey of the United States was initiated in 1917. This survey was authorized by Congress and is carried on by the U. S. Department of Agriculture in cooperation with agricultural colleges, experiment stations, and various specialists in plant diseases, and it brought to light many new diseases, as well as old parasites on new hosts. There was also much study of the causes of diseases of plants and of means for their control. Among the diseases of great economic importance reported in the United States are blister rust of white pine and related species; leaf and stem rusts and smuts of wheat; rusts and smuts of oats; stripe, rusts, and smuts of barley; ear and root rots of corn; mosaic, leaf roll, and late blight of potatoes; anthracnose, leaf spot, and wilt of cotton; and bitter rot, blotch, and scab of apples. The losses attributed to plant diseases in the United States were very great. According to estimates made by the Plant Disease Survey, the losses of a few of the

leading crops in 1926 were: wheat, 63,840,000 bushels; barley, 12,153,000; oats, 144,123,000; corn, 388,199,000; apples, 27,089,000; peaches, 4,720,000, and cotton, 3,256,000 bales. The value of the crops destroyed was well over half a billion dollars.

The chestnut blight due to *Endothia parasitica*, which made its appearance in the vicinity of New York City about 1904, was probably introduced from Asia. It spread with great rapidity, and at the end of 1923 practically all the native chestnut trees in New England, eastern New York, New Jersey, Pennsylvania, and Maryland had been destroyed, and the disease is spreading toward the South and West where it is expected all the native chestnut trees will be destroyed by 1940 or sooner.

Citrus canker caused by *Bacterium citri* was discovered in Florida and other Gulf States in 1916. This disease was believed to have been introduced from Japan, where it does comparatively little damage except to navel oranges. In the Gulf States, it soon became very destructive, especially to oranges and grapefruit. Congress appropriated more than \$1,850,000 for studies of this disease and means for its control. This sum was supplemented by State and other contributions, and the work on control was carried on coöperatively with the States where the disease occurred. Florida was most severely affected and many thousands of trees were ruined. As a result, citrus canker appeared to have been eradicated from the State, for no new infestations have been reported since 1927. The same disease was reported in South Africa, where similar methods of control were applied with gratifying success.

The Plant Disease Survey found the black-wart disease of potatoes caused by *Chrysophlyctis endobiotica* in Pennsylvania in 1917. Later, it was discovered in a few localities in Maryland and West Virginia. This disease is believed to have been brought from Europe, where it is considered a serious trouble. All the localities where it was found in the United States are mining communities which are not important producing centres. Strict quarantines were established about them, and by the growing of immune varieties of potatoes, the disease has been practically stamped out.

The white pine blister rust continued to be a subject of much concern not only to plant pathologists but to important industries dependent on the white pine and related species for timber. The fungus, *Peridermium strobi*, which causes this disease, has a complex life cycle. It spends different phases of its existence on the white pine and on currants and gooseberries. This parasite, probably introduced from Europe on white pine seedlings, was first reported in the United States about 1906. All the five-needle pines and most species of currants and gooseberries are subject to attack. The blister rust occurs quite generally throughout parts of New England and southern Ontario, and in parts of Minnesota and Wisconsin, with scattered infections on either white pines or currants in New York, Pennsylvania, and Michigan. It was reported in Washington and British Columbia in 1922 and it had spread to Idaho, Montana, and Oregon in 1928.

The fungus cannot infect pine trees from other pines but must pass through its alternate hosts, wild or cultivated species of *Ribes*. Advantage has been taken of this fact and control

measures are based on the destruction of all species of *Ribes* occurring in the vicinity of white pines, and in the northeastern part of the United States about one-third of the white pine area has been cleared of currants and gooseberries at a cost of only about \$.30 an acre. This method of control appears entirely practicable, and the cost is insignificant as compared with the value of the white-pine timber of the country. Since 1916 Congress has appropriated about \$3,500,000 for cooperative work with the States in attempting to control the spread of blister rust.

Another disease of great agricultural importance, in the control of which some progress has been made, is the stem rust of wheat due to *Puccinia graminis*. The relation of this fungus to the common barberry has long been known, and in some European countries attempts have been made to control the rust on wheat by the destruction of barberries in the vicinity. About 1918 an active campaign was begun in the United States for the destruction of all common barberry bushes in a number of the leading wheat-producing States. Since then, Congress appropriated more than \$3,200,000 toward the expense of eradicating barberries in 13 of the North Central States, the work being carried on coöperatively with State officers. The bushes were grubbed out of the ground or destroyed by the application of coarse salt or arsenates about them. In this way, many millions of barberry bushes were destroyed in the hope that by the removal of one of the alternate hosts, epidemics of rust infection would be avoided. Whether this will be entirely successful over wide areas is problematical, for recently spores of the form capable of infecting wheat were caught in spore traps exposed on airplanes at 7000 feet elevation, indicating the possibility of infection from regions where the uredospores retain viability throughout the winter. Several local infections have been avoided in many regions through the destruction of the barberry bushes. In connection with studies of the wheat-rust problem, varieties of wheat have been found that are immune to the stem rust, and reliance on them seems to offer a means of control.

The so-called virus or mosaic diseases of plants took on importance, not only on account of their wide distribution and destructive effect but through the various hypotheses presented regarding their origin. These diseases are characterized by a certain dwarfing of the plants, abnormal coloring and blotching of the foliage, and in some cases marked changes in the form and texture of the leaves. A considerable number of important crop plants are subject to attacks of this character, among them sugar beets, sugar cane, maize, tobacco, tomatoes, potatoes, beans, etc. In the case of the potato, the disease manifests itself in a number of ways that have given rise to special names, such as mosaic, leaf roll, crinkle, streak, spindling sprout, etc. They are also called degeneration diseases from their effect on subsequent generations of infected plants. On some plants, there is a distinct yellowing of the foliage, as in the peach, or a mottling, as in the leaves of sugar cane, corn, tobacco, beans, cucurbits, etc. In the sugar beet, the disease causes a curling and mottling of the leaves which produces a condition known as curly top. The cause, or causes, of mosaic diseases were not definitely determined. By some investigators, they were called virus diseases, since the

causal agent readily passes through a porcelain filter and sound plants may be infected by the introduction of the filtrate into their tissues. Others considered them to be due to organisms so minute as to escape detection by the best microscopes. Still others claimed they were due to protozoan parasites, and a number of investigators, following Lafont, who was the first to find protozoa in living plants, reported the presence of flagellates and similar bodies in diseased tissues, and causal relations were attributed to them. Quite a number of investigators have reported the presence of definite bodies in diseased cells, but their relationship to the incidence of the disease was not established.

Nelson reported in 1922 the discovery of protozoa-like bodies in plants affected with mosaic diseases. The accuracy of the determination was questioned, but in 1923 McKinney and his coworkers reported the occurrence of intracellular bodies in wheat plants affected with mosaic which are claimed to be stages in the life of some organism. Iwanowski reported such bodies in 1903, but did not associate them with mosaic, and Palm in 1922 considered them as possible causes of tobacco mosaic. In 1924 Kunkel added further evidence to their probable causal relations. He considered that at certain stages they may pass through a filter. So far as was known, there had been no disease successfully produced with cultures of these organisms, with the possible exception of that reported by McWhorter, who claimed to have produced the Fiji disease of sugar cane by the introduction of cultures of amoeba. Oltsky claimed he had grown the causal agency of tobacco and tomato mosaic in culture media, but Purdy, Mulvania, and others found no evidence to substantiate the claim.

The means by which mosaic diseases are transmitted from plant to plant are quite varied. Perhaps the most are distributed by insects, mostly aphids, which act as mechanical carriers of the infection, but in the case of curly top of sugar beets the infective material must remain for a definite period in the body of a leaf hopper, *Eutettix tenella*. Some of these diseases are not limited to a single host plant but pass readily to unrelated species. A number are known to winter over on perennial weeds and infect crops the next season. Some are carried from crop to crop in the seed, while, in the potato, some forms of mosaic are undoubtedly carried in the tubers used for planting. The active principle is known to remain effective in dry tobacco leaves for 24 years. Avoiding the use of infected material for planting, the growing of resistant varieties, of which there are many, and combating the insects that act as carriers are the most hopeful methods of controlling mosaic diseases of plants.

The number of diseases of plants caused by bacteria has greatly increased and there are probably a hundred species of bacteria known to cause such diseases, and as some of them are capable of infecting a large range of plants, the total number of affected species is considerable.

PLATINUM. Inasmuch as Russia was the chief source of the world's supply of platinum previous to the World War, it was inevitable that many changes should develop in the mining and refining of this essential metal, which already had become more valuable than gold, as well as in its marketing. In 1912 the world's production of platinum was estimated at 313,529 ounces, of which amount 300,000 ounces was credited to Russia. At this time, Colombia, which was destined to become an important source of production, produced 12,000 ounces, while between 700 and 800 ounces of crude platinum were produced in New South Wales and Tasmania and in the United States, respectively. In the period following, there was an increased demand for platinum in jewelry and, during the War, for use in the chemical industries. As early as 1914, an embargo was placed on platinum in Russia, and from that time the production declined, dropping from 202,000 ounces in 1914 to 53,000 ounces in 1916, and to probably about 5,500 ounces in 1921. The effect of this shrinkage was to reduce the world's production in 1921 to less than 60,000 ounces, which probably marked the lowest ebb in the production of this valuable mineral.

With the decline in production in Russia, there was an increase in the output from Colombia which was 34,000 troy ounces in 1921 and 55,000 in 1926. About 1921, an international platinum syndicate was formed, consisting of strong financial organizations in New York, London, Paris, and Hanau. This syndicate agreed to take from the Soviet Government of Russia 60,000-70,000 ounces a year on the condition that no Russian platinum be sold directly; but when the Russian production in 1925 and 1926 materially exceeded this amount, the Soviet representatives desired a larger allotment, whereas the syndicate desired to reduce the Russian quota because of increased production elsewhere. As a result, the agreement was not renewed upon its expiration in March, 1927, and the Soviet output was put on the market directly in competition with that of the syndicate. Demoraliza-

tion of the market followed and the average price declined from \$119.09 per ounce in 1925 to \$78.58 in 1928. Early in 1929, numerous unofficial reports were given publicity to the effect that the Soviet representatives were making overtures for re-admission to the syndicate, but verification of these rumors was lacking.

Production of platinum in Canada and in South Africa has increased rapidly in recent years. Virtually all of Canada's production is obtained from the treatment of the Sudbury nickel ores. In 1928 Canada produced 24,139 ounces of platinum, palladium, iridium, rhodium, and ruthenium, valued at \$1,330,742. The first direct production of platinum in South Africa was early in 1926, and in 1927 the output totaled 10,431 ounces. Metallurgical problems in the treatment of platinum native ores of the Transvaal, of which there is reported to be a tremendous tonnage available, are being solved in the laboratory and, when application of the process evolved is made on a commercial scale, the amount of platinum available from South Africa should be considerable and will add to the complexity of the present marketing situation.

The demand for platinum in the jewelry trade was reported to have slackened considerably with the recent lowering in prices, and inasmuch as the consumption of platinum in the jewelry trade is more than 70 per cent of the total, as is indicated in the accompanying table of industrial consumption, the importance of this trend becomes readily apparent.

The average prices of platinum in the New York market from 1914 to 1928 are summarized in the table following

AVERAGE MONTHLY PRICES OF PLATINUM, NEW YORK MARKET ^a			
Year	Price	Year	Price
1914	\$ 45.14	1922	\$ 97.618
1915	47.13	1923	116.537
1916	83.40	1924	118.817
1917	102.82	1925	119.093
1918	105.95	1926	113.269
1919	114.61	1927	84.616
1920	110.90 ^b	1928	78.580
1921	75.033 ^c

^c Minimum monthly average \$70.227

NEW PLATINUM METALS RECOVERED BY REFINERS IN THE UNITED STATES, IN TROY OUNCES

Year	Platinum	Palladium	Iridium	Osmiridium	Others	Total
1919	40,220	3,807	401	402	279	45,109
1920	36,015	4,309	418	409	393	41,544
1921	51,791	2,686	286	581	1,026	56,370
1922	54,142	1,943	210	1,301	122	57,718
1923	46,780	1,934	280	787	16	49,797
1924	57,827	6,065	680	1,261	174	66,007
1925	41,300	7,358	283	648	54	49,643
1926	76,154	6,477	234	2,113	43	84,981
1927	41,121	3,879	256	631	163	46,050
1928	51,427	5,148	1,658	458	348	59,039

The platinum refiners of the United States in 1928 purchased 365 ounces of crude placer platinum of domestic origin and 57,962 ounces of foreign crude platinum, according to the U. S. Bureau of Mines. In 1927 these refiners purchased 236 ounces of domestic crude platinum and 48,907 ounces of foreign crude platinum. Domestic material purchased in 1928 included 299 ounces from California and 66 ounces from Oregon. Purchases of foreign crude platinum in 1928 were Australia, 1086 ounces; Canada, 14 ounces; Colombia, 53,744 ounces; and from other countries not specified, 3118 ounces. Refined platinum metals recovered in 1928 from crude platinum, from ore and concentrates, and from gold and copper refining amounted to 59,039 ounces, of which 321 ounces was reported to have come from domestic materials.

SECONDARY PLATINUM METALS RECOVERED IN THE UNITED STATES, IN TROY OUNCES

Year	Platinum	Palladium	Iridium	Others	Total
1919	54,545	3,467	3,504		61,516
1920	51,255	3,100	3,355		57,710
1921	39,131	4,887	1,776	229	46,023
1922	40,062	4,193	1,937	496	46,688
1923	39,152	6,246	2,021	453	47,872
1924	45,471	5,784	2,200	1,013	54,471
1925	35,578	4,680	1,827	1,189	43,274
1926	38,795	5,647	1,478	217	46,137
1927	46,127	4,241	1,810	891	53,072
1928	47,157	4,156	2,090	2,428	55,831

In the United States, the considerable consumption of platinum has to be met by extensive imports, though some is obtained from the refining of gold, copper, and nickel ores (see accompanying tables).

IMPORTS OF THE PLATINUM GROUP METALS INTO THE UNITED STATES (From *Mineral Industry*)

Metal	1926		1927		1928	
	Troy ounces	Value	Troy ounces	Value	Troy ounces	Value
Platinum	114,968	\$11,803,609	128,544	\$11,187,931	108,447	\$7,696,599

PLATONISM. See PHILOSOPHY.

PLATOON SCHOOL ORGANIZATION.

See EDUCATION IN THE UNITED STATES.

PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA. An organization founded in Washington, D. C., in 1906. Its

work for the development and improvement of playgrounds and neighborhood recreation schools was continued actively throughout the period after 1914. Through the employment department of the association, many officials were enabled to select workers with training and experience. During the War, the association sent community organizers into each of the cities near the training camps to organize social and recreational life for the benefit of the soldiers in their free time. This was known as the War Camp Community Service, and over 400 community organizers were engaged in the work. The result of this service was that men in the service were given home hospitality, community singing, athletic activities, and other forms of amusement. During 1919 the association sent field workers to the communities desiring their services, to help plan their work and to secure municipal appropriations. In the same year, the National Physical Educational Service was inaugurated to assist states in securing adequate compulsory physical education laws; this department was still in existence in 1929, and as a result legislation and appropriations had been secured in many states and cities for recreational purposes.

Special effort was made in 1921 for the passage of a Federal physical education bill; a continuation service, established in 1921, and continued in 1922 and 1923, proved itself of value by giving help and advice on recreation problems to many cities already having recreational systems. During 1923 the association aided approximately 200 communities by conducting summer playgrounds and municipal year-round systems through the service of its continuation field secretaries. It gave further service by helping to secure, in five States, home-rule bills giving cities power to establish year-round recreation systems. In 1924 the association compiled *21 Fundamentals in Community Recreation* and published in a manual the results of a summer camp study, in 1925 appeared its *Normal Course in Play*, useful to educational institutions in the training of recreation workers; and among the publications distributed in 1926 were the *Community Drama Handbook*, *Community Music Handbook*, *The Christmas Book*, and programmes for the celebration of holidays and special days.

In 1926 the association established the National Recreation School, which conducts a graduate course in professional recreation training. The outstanding publications of the association in 1927, in addition to its regular monthly publication, were, *A Nature Almanac*, and *88 Successful Play Activities*. During 1928 a full time worker was assigned, in cooperation with the U. S. Department of Agriculture, to help in the training of rural leaders for recreation. *A Manual of Municipal and County Parks*, begun in 1927, was issued during 1928; also *Play Areas—Their Design and Equipment*, and a game book, *Recreation Games and Programs*. The 1928 recreation congress, which was the fifteenth annual meeting of the association, was held at Atlantic City, N. J., in October. The officers for 1928 were: President, Joseph Lee; treasurer, Gustavus T. Kirby; and secretary, Howard S. Braucher.

Headquarters of the association were at 315 Fourth Avenue, New York.

PLIEKSANS, JANIS. See RAINIS, JANIS.

PLOWING. See TRACTOR.

PLUMB PLAN. See INDUSTRIAL DEMOCRACY.

PLUMER, HERBERT CHARLES ONSLOW, FIRST VISCOUNT OF MESSINES AND OF BILTON (1857–). A British soldier. He entered the army in 1876 and served in the Sudan and in South Africa, where he commanded a corps of mounted rifles, and took part in the South African War (1899 to 1902), in the latter year being promoted to major general. He became lieutenant general in 1908 and was in charge of the Northern command from 1911 to 1914. In 1915 he was made commander of the 5th Army Corps in France and from 1915 to 1917, of the 2d Army. He was promoted as general in 1916. From November, 1917, to March, 1918, he commanded the Italian Expeditionary Force, returning in the latter year to France to resume his position at the head of the 2d Army, which he led until the close of the World War. He was credited with the defeat of the army under Prince Rupprecht of Bavaria. After being commander of the Army of the Rhine, in 1919 he was appointed Governor and Commander-in-Chief of Malta (resigned 1924), was made field marshal and created first Baron of Plumer. He was High Commissioner for Palestine (1925–28) and in 1929 was made a viscount. He received many decorations from Great Britain and foreign governments.

PLUNKETT, GEORGE NOBLE, COUNT (1851–)

An Irish poet and writer on art and antiquities, who was born in Dublin and educated at Nice, Clongowes College, and Dublin University. He was director of the National Museum of Science and Art in Dublin (1907–16), was a member of Parliament from 1917–27, and served as Minister of Foreign Affairs and of Fine Arts in the Free State Government. Pope Leo XIII created him Count of Rome. His writings include many scattered poems, *Sando Botticelli* (1900); *Pinelli* (1904); *Architecture of Dublin* (1908); *Arrous* (1921); and *Echoes* (1928). He edited *Hibernia*, a literary and artistic review (1882–83), and Stokes's *Early Christian Art in Ireland* (1911–15).

PLUNKETT, RT HON SIR HORACE (CURZON) (1854–).

An Irish public official and writer (see Vol XVIII). During the agitation in Ireland following the rebellion of 1916, he tried to bring about an understanding with the British government. In 1917–18 he was chairman of the Irish Convention which attempted to find a peaceful solution of the Irish Question. Always interested in the agricultural problem of Ireland, he created and endowed the Horace Plunkett Foundation, a trust for the promotion of agricultural development, in 1919. He was Senator of the Irish Free State (1922–23), and in 1923 visited the United States in the interests of his Government. During his absence, his home was burned by an Irish republican mob. He wrote *Tendencies of Modern Medicine* (1913); *A Better Way—An Appeal to Ulster not to Desert Ireland* (1914); *Home Rule and Conscription* (1918); and *Oxford and the Rural Problem* (Sidney Ball Memorial Lecture, 1920). Consult *Sir Horace Plunkett and His Place in the Irish Nation*, by Edward E. Lysaght.

PNEUMONIA. Ordinary seasonal pneumonia, which attacks the young and middle-aged, as well as the old, has been studied intensively in the Rockefeller Institute and it has been found that the fatal outcome is due largely to a specially deadly strain of the pneumococcus, while other strains have a considerably lower mortality or are more amenable to treatment. For the pneumonic complications of the pandemic of influenza, see INFLUENZA.

In May, 1924, Dr. L. D. Felton, working in a Harvard University laboratory under the auspices of the Metropolitan Life Insurance Company, announced the discovery of a serum, which had been freely tested in various types of pneumonia with an apparent reduction of mortality of from 25 to 50 per cent of those treated. Unlike various similar announcements made from time to time, this one had the indorsement of several conservative pathologists and health officers. It is of special significance because such a serum can be applied in any pneumonia without awaiting a bacteriological diagnosis.

One of the oldest drug remedies for pneumonia—quinine or its synthetic derivatives—still retains its position and Dr. John, a German physician, with other well-known practitioners, insists that it has all the force of a specific in pneumococcus cases, although they do not wait for a bacteriological test, at once administering quinine hypodermically. John claims that he does not require the usual heart stimulants for his patients under the quinine treatment. For the past few years, physicians in different parts of the world have claimed remarkable results for the diathermic high-frequency current in pneumonia cases, the method having originated with Dr. H. E. Stewart, of the U. S. Marine Hospital Service. Naturally, it can be carried out only by skilled hospital attendants.

POFFENBERGER, ALBERT THEODORE (1885–). An American psychologist, born at Dauphin, Pa., and educated at Bucknell and Columbia universities. He joined the faculty of Columbia as instructor in psychology in 1912 and became professor in that subject in 1927. He wrote *Experimental Psychology*, a laboratory manual (1916); *The Sense of Taste* (1917); *Applied Psychology* (1917, rev., 1923); *Psychology in Advertising* (1925); and *Applied Psychology—Its Principles and Methods* (1927).

POINCARÉ, pwān'k'ará', RAYMOND (1860–). A French statesman (see Vol. XVIII). He was President of the French Republic from 1913 to 1920. In August, 1914, at the outbreak of the World War, President Poincaré, by a speech appealing to the patriotism of the French lawmakers, brought about the formation of a political *union sacrée* which maintained the Viviani cabinet in power for over a year, until accumulation of the country's misfortunes and discontent with the prosecution of the War defeated it, and Viviani gave place to Briand. Poincaré at all times urged vigorous prosecution of the War, and after the Armistice, he insisted that there should be no relaxation of the terms of the Treaty of Versailles for Germany. On his retirement from the Presidency in 1920, he was elected to the Senate, and in January, 1922, he formed another cabinet, taking the portfolio of Foreign Affairs. To insure the payment of reparations,

he ordered the French military occupation of the Ruhr, Germany's most important industrial area, in 1923. After the fall of his ministry in June, 1924, he remained comparatively inactive until he again became Premier and Minister of Finance on July 23, 1926, when the franc was so low in value that national bankruptcy was threatened. With firmness and insight, he stabilized the currency and ably led the country to financial recovery. Weakened in health, he resigned on July 26, 1929, after securing ratification of the Mellon-Bénérger and Caillaux-Churchill debt agreements. His later writings include *Messages, discours, allocutions, lettres, et télégrammes* (3 vols., 1919-21); *Histoire politique* (4 vols., 1920-22); *La victoire et la paix* (1921); *Les origines de la guerre* (1921; trans. 1922); *Au service de la France, 1912-1921* (4 vols., 1926-27; 3 vols. trans. as *The Memoirs of Raymond Poincaré*, 1926-29); and *Paroles françaises* (1927).

POINDEXTER, MILES (1868–). An American legislator and diplomat (see Vol. XVIII). He served in the United States Senate from Washington from 1911 to 1923, but was defeated for reelection in 1922. From 1923 to 1928, he was United States Minister to Peru.

POLACCO, GIORGIO (1875–). A distinguished Italian operatic conductor (see Vol. XVIII). In 1918 he became principal conductor of the Chicago Opera Company, and after its reorganization as the Chicago Civic Opera Company, in 1922, he also was made artistic director. In 1919 he married the dramatic soprano, Edith Mason, from whom he was divorced in 1929.

POLAND. A European republic erected by the Treaty of Versailles in 1919. Poland has an area of 149,958 square miles, the principal sections being Congress Poland (formerly Russian Poland), Posen, Pomerania, Galicia, Upper Silesia, and Vilna, and a population of 30,213,000 (Jan. 1, 1928), of which 65 per cent was engaged in agriculture, 14 per cent in mining, and the balance either in trade or other pursuits. As for religion, the population is preponderantly Roman Catholic, other religions being the Greek Catholic, Jewish, Russian Orthodox, and Protestant. The Polish language is spoken universally. The principal towns, with their populations in 1927, are Warsaw, 1,028,982; Lodz, 578,069; Lemberg, 233,596; Crakow, 191,385; Poznan, 226,827; and Vilna, 200,000. Emigration in 1927 totaled 147,614, the principal countries of destination being Germany (68,779), Canada (22,031), Argentina (20,189), and France (16,211). In 1928 there were 26,642 elementary schools with 70,585 teachers and 3,379,967 pupils; 796 secondary schools with 14,808 teachers and 215,470 pupils; 204 colleges for teachers with 1931 teachers and 37,420 pupils; and 850 technical and professional schools with 110,000 pupils. The universities and institutions of university rank numbered 16 with 950 professors and 36,590 students in 1926.

Agriculture. In 1926 there were reported 45,239,000 acres of arable land, or 47 per cent of the total area. The principal crops, based on a five-year pre-war average from 1909 to 1913, and for 1922 and 1927, are shown in the table, on page 1266, with figures in thousands.

Poland is self-sufficient in major food products, and exports considerable quantities of grain, potatoes, sugar, alcohol, and eggs. There were

many large land holdings in the country, but these are gradually being broken up into small farms through the agrarian reform law of July 6, 1920, limiting the size of estates, and through high taxation. The live-stock census for 1928 showed: horses, 4,128,000; cattle, 8,571,000; sheep, 1,917,000; hogs, 6,397,000. About 25 per cent of Polish territory is covered by forests, or 22,323,630 acres. The biggest and finest forests are in the eastern part of Poland. There is also the famous Bialowiez reservation, which covers about 600,000 acres. The Government itself owns several million acres of forest lands, with an approximate value of one-half billion dollars, which is more than the combined internal and external debt. There are also large forests in the Carpathian Mountains, in some districts covering more than half of the total area. The principal varieties of trees found are oak, ash, pine, spruce, and pitch pine.

in the province of Galicia. The industry fell off considerably after the World War, refinery for 1923 being 603,190 tons. Total petroleum production for 1927 was 720,000 metric tons, and for 1928 742,800 metric tons, as compared with 1,114,000 tons in 1914. Reserves of petroleum are estimated at 200,000,000 tons.

Communications. Poland possesses a very well-developed railway system. Nearly all lines are state owned and operated. Total of standard trackage in Poland in 1929 was 16,726 miles. In 1928 there were 5333 locomotives, 11,685 passenger cars, 138,974 freight cars. Poland had a merchant marine of 21 vessels with a gross tonnage of 47,000 on Jan. 1, 1929, and was largely dependent for port facilities upon the Free City of Danzig, on the Vistula. The vessel tonnage entering Danzig in 1928 was 4,045,000; cleared, 4,027,000. In 1927-29 Poland was pushing the development of an all-Polish port at Gdynia,

	Sowing Area in hectares			Crops Metrics tons		
	1909-13 average	1922	1927	1909-13 average	1922	1927
Wheat	1,353	1,046	1,087	1,704	1,160	1,678
Rye	5,087	4,578	4,773	5,749	5,066	5,711
Bread grains	6,440	5,623		7,433	6,226	
Barley	1,265	1,147	1,225	1,517	1,304	1,489
Oats	2,749	2,404	2,558	2,051	2,548	2,814
Potatoes	2,644	2,284	2,379	25,300	33,754	24,790
Sugar beets	178	109	199	4,828	2,671	4,113

Mining. Through the acquisition of Upper Silesia in 1922, Poland became the possessor of one of the richest mining sections of Europe and from an importer of coal became an exporter. The estimated reserve was put at 63,000,000,000 metric tons. Coal production for 1928 was estimated at 40,800,000 metric tons and the output for 1927 was 38,152,550 metric tons, including 78,464 tons of lignite, of which 10,919,000 metric tons were exported. Of iron ore, there is an estimated reserve of 300,000,000 tons of 27 to 32 per cent ore, located principally in Silesia. The output in 1928 totaled 690,000 metric tons and in 1927, 618,203 metric tons. There are also large areas of zinc and lead in Polish Silesia, the country ranking sixth in the world production of these minerals. The principal salt mines are located in Galicia and the reserves of this commodity are considered inexhaustible. Salt production totaled 396,000 metric tons in 1928 and 378,261 in 1927; potash, 343,200 metric tons in 1928 and 276,062 in 1927.

Industry. The section of Poland formerly belonging to Russia was one of the principal manufacturing sections of that empire. The principal industries in approximate order are textile, heavy iron and steel, petroleum refining, zinc, lumber, machinery, chemicals, sugar, glass, cement, leather, alcohol, paper, and starch. The city of Lodz is the centre of the textile industry, with an estimated annual capacity at normal operation of 80,347 tons of cotton yarn, 82,000 tons of wool yarn, 78,740 tons of cotton fabric, and 27,300 tons of wool fabrics. The metallurgical industry production for 1928 was: pig iron, 678,000 metric tons; steel, 1,437,600 metric tons, rolled materials, 1, 521,600 metric tons; zinc, 162,000 metric tons. Production for 1927 was: pig iron, 624,000 metric tons; steel works, 1,248,000 metric tons; rolling mills, 936,000 metric tons; zinc, 156,000 metric tons. Poland is one of the principal petroleum-producing countries of Europe, the oil-bearing land being located

which had entrances of 985,000 tons in 1928 and clearances of 974,000 tons. The Polish port of Tezew was also being developed. One-half of the total area of Poland is located in the drainage basin of the Vistula River, which is one of the most important waterways in Europe. Rising in the Carpathian Mountains in the extreme south of Poland, this river flows through the great Polish plain and into the Baltic Sea. Approximately 650 miles in length, the Vistula drains over 75,000 square miles of territory. With but two exceptions, the larger cities of Poland are situated on the Vistula River and its tributaries. River transportation, however, fell off considerably after 1919. The water-power resources of Poland are very great. It is estimated that 1,000,000 horse power could be developed. Sixty per cent of this is in the Province of Galicia. In 1928 Poland had 26,458 miles of telegraph line and 68,824 miles of telephone wire, with 210,255 instruments.

Finance. In 1927-28 state revenues and expenditures reached a record of \$310,555,000 and \$280,927,000, respectively, leaving a surplus of nearly \$30,000,000. Receipts and disbursements exceeded by 39 and 26 per cent, respectively, the revised budgetary estimates for the year. The budget for 1928-29 provided for revenues of \$283,669,000 and expenditures of \$297,892,122. Actual receipts were \$337,457,544 and actual expenditures \$315,109,548 (figures for last 2 months of fiscal year subject to slight correction). The budget for 1929-30, as adopted by Parliament, carried a total of 2,054,967 zlotys of anticipated revenues, and 2,787,778,000 zlotys of proposed expenditures. The total public debt on July 31, 1928, was \$460,533,090, of which \$427,856,523 was external. On the same date, obligations due to the execution of the Protocol of Innsbruck totaled \$36,485,873. The unit of currency is the zloty, established in June, 1924, with a par value of \$0.1930, but revalorized on Oct. 13, 1927, at \$0.1122. In the stabilization

plan put into effect in 1927, provision was made for an American financial adviser.

Commerce. Statistics on Polish foreign trade, prior to 1922, were not available and, even though they were, would not form a correct basis of comparison for data from that date on, due to the acquisition of Upper Silesia in that year, with its pronounced effect on the foreign trade of the country. The outstanding feature of the Polish foreign trade of 1928 was the adverse balance of \$95,838,322 as compared with a favorable balance of \$78,659,000 in 1926. In 1927 the adverse balance was \$42,707,000. The favorable balance in 1926 had been the result of drastic restriction of imports and reduced buying power on the one hand, and of exceptionally large exports of coal during the British coal stoppage on the other. The sharp adverse turn in 1927-28 was caused by the increase of imports, which more than doubled, while exports increased by only 11.7 per cent in 1927 and dropped slightly in 1928. The five leading imports in 1928 were: raw cotton (\$36,538,266); machinery (\$35,908,488); chemicals and allied products (\$4,262,962); metals and metal manufactures (\$27,445,915); wheat (\$23,201,838). Total imports in 1928 were valued at \$377,234,800. The five leading exports were wood and manufactures (\$66,203,946); coal and coke (\$40,282,605); metals and metal manufactures (\$31,394,000); swine (\$23,349,717); textiles (\$16,757,631). Total exports in 1928 were valued at \$281,396,478. In 1927 the United States supplied 12.9 per cent of the imports and purchased 0.8 per cent of the exports, Germany, 25.5 and 32; the United Kingdom, 9.4 and 12.2, Austria 6.5 and 11, and Czechoslovakia 5.8 and 10.1. Imports in 1928 were purchased principally from Germany, the United States, United Kingdom and Ireland, Austria, Czechoslovakia, and France in the order named. The heaviest purchasers of Polish products in 1928 were Germany, Austria, Czechoslovakia, and the United Kingdom and Ireland in the order named.

History. In Russian Poland, prior to the World War, there was a very marked division of sentiment. Following the ill-starred Polish revolutions in the middle of the nineteenth century, Russia had applied herself sedulously to the task of breaking the Polish national spirit. Use of the Russian language was required, the Roman Catholic Church was opposed, and more insidiously, the Government at St. Petersburg sought to divide the country by inciting the peasants to uprisings. The Polish peasants were emancipated in 1864 and given a share in local government, but the effect of these measures was reduced by the advance of industrialization, bringing with it a socialism strongly tinged with nationalism, which was much in evidence down to the War. By 1914 many Poles gravitated toward Austria, some toward Germany, and some toward Russia, while a large number still clung to nationalistic aspirations. In Galicia (Austrian Poland), the Austrian government sought to gain the adherence of the Poles through a policy of studied kindness, permitting them the use of their own tongue in schools and law courts and granting them wide political and educational privileges, but, at the same time, covertly encouraged the Nationalist agitation of the Ruthenian minority, whom the Poles—it is charged—oppressed. Galician Poles were thus divided, some favoring Russia and others Austria.

In Prussian Poland, the Poles had firmly in-

trenched themselves economically and many of them had become successful members of the middle class. The fire of Polish nationalism was kept burning for the most part by the Catholic clergy, and the educational institutions in the former Austrian provinces—chiefly by the Cracow University. Aided by money and power, they created a strong nationalistic sentiment, against which Bismarck's Germanization campaign, characterized by an attempt to suppress Polish culture and to settle German colonists on the land, operated in vain. In spite of official animosity, Poles under Austria maintained their economic preponderance and their nationalistic unity and were almost completely mobilized for political independence by 1914.

When the World War broke out, there was thus no common sentiment to hold the loyalty of all the Poles. One group gravitated toward Russia, hoping for autonomy under the Russian Crown, another, under Josef Pilsudski, looked to Austro-German aid for the erection of a republican Poland that could serve as a buffer state against the Russian advance. A Polish legion was formed and offered to Austria, but no definite pronouncement of policy occurred until November, 1916, when the Central Powers recognized the independence of the Russian Poland but accorded autonomy only to Galicia. In the ensuing years, however, Poland came completely under German domination, which crushed all opposition. The Austrian Poles were suppressed, Pilsudski was arrested, and the Polish legion used merely as an auxiliary for the German Army.

With Russia no longer a menace, Polish hopes could conveniently be ignored. Not until the close of the War did the hope of an independent Poland definitely materialize. In October, 1918, a really National Polish Diet met, and at the same time the Austrian Poles quit the Reichsrat to assemble at Cracow. Meanwhile, a Polish Army, recruited in the United States and other countries, had been fighting as a recognized national unit on the western front, while the Polish National Council at Paris kept the Polish aspirations before the Allied leaders.

From Nov. 14, 1918, on, Pilsudski, who had been released by German revolutionists, was invested with full powers of a dictator. His known radical sentiments for a time threatened to disrupt Polish unity, and, had it not been for his political astuteness, the problem of creating a Polish state might have been well-nigh insuperable; but the conservatives were won over by the appointment to the Premiership of M. Paderewski, the musician and composer, who stood high in the favor of the Allies as a result of his work with the Polish National Council. A Constituent Assembly was next provided for and this body met at Warsaw on Feb. 9, 1919. Something of the divergent loyalties in the new nation may be gauged from the political grouping. There were 91 National Democrats, 51 Polish Peasants, 19 Peasants' Unionists, 14 Socialists, 7 Workmen's Unionists, 8 Jews, 6 United Polish Peasants, 2 German Colonists. A Conservative bloc supported the Paderewski government.

The problems before the administration were complex enough to try the strongest minds. The marking out of the frontiers in accordance with the Peace of Versailles and to the satisfaction of the Polish nationalistic aspirations led to a whole series of minor struggles in which, at one time or another, Poland saw herself engaged with almost

all her neighbors; while the erection of a constitution, the economic rehabilitation of the country, the problem of racial minorities, in particular, the Jewish question, all brought in their wake domestic difficulties of the most serious import. These matters must all be considered in some detail.

The peace treaties, as brought back to Poland in 1919 by M. Paderewski, made the following provisions: on the west and north, the boundary followed fairly closely the ethnographic frontiers; the greater part of Posen and part of West Prussia were granted to Poland, while the disposition of Masuria and Upper Silesia was made to depend upon plebiscites. Danzig (see DANZIG) was made a Free City, though the "corridor" and the administration of the Vistula River were to be turned over to the Poles. In the south, by a supplementary treaty signed on Aug. 10, 1920, Poland received West Galicia, with a slightly readjusted southern frontier. Eastern (Ruthenian) Galicia was to be provisionally assigned to Poland for a term of years. On the east, no definite frontier was established by the treaties, owing to uncertainty regarding Russia's future status; but the Peace Conference merely recommended a tentative minimal eastern boundary, based largely on linguistic statistics, leaving details to be settled subsequently by Russia and Poland. Furthermore, the Peace Conference required Poland to sign a minority treaty, June 28, 1919, which provided for religious freedom; equal civil and political rights for all inhabitants regardless of race, language, or religion; and freedom of transit on Polish waterways and railways for Allied Powers.

The number of hostilities in connection with the peace settlement was really astounding. With Czechoslovakia, a dispute arose over the disposition of the border districts of Teschen, Zips, and Orava, and some fighting actually took place in January-February, 1919. The first, Teschen, occupied a peculiar importance, having rich coal and iron deposits, as well as an important railway running through the heart of the district. In the west, the population was Czech, in the east, Polish. The wrangling dragged on over a year until finally, by the intervention of the Council of Ambassadors in the middle of 1920, an agreement was reached whereby most of the coal mines and the railway were given to Czechoslovakia, while the city of Teschen was left in Polish territory. By the same decision, the other two districts were similarly divided, the greater proportion of each going to Czechoslovakia. With the Ruthenians in Galicia, feelings were so bitter that actual warfare broke out in 1919. The conflict was waged intermittently, attacks being sporadic and as a rule, on defenseless populations. The Jews of Lemberg, in particular, suffered. Not until April, 1920, did hostilities cease. By the agreement reached, Poland gained *de facto* possession of East Galicia.

It was the war with Russia, however, that occupied most of Polish attention and diverted consideration from the more pressing domestic problems. Incited, it is now generally admitted, by the French, but as much motivated by her own nationalist ambitions, Poland, early in 1920, after some fighting in the previous year, launched a large-scale offensive against Russia. Her aim was to establish the frontier of 1772, and having gained the Ukraine as an ally, the moment was deemed propitious for the realization of the Polish hopes. Allied preoccupation elsewhere, and

the desire on the part of the French to use Poland in a "sanitary cordon" against Bolshevism, gave spur to the adventure. The Poles pressed forward for more than 300 miles, took Kiev in May, 1920, and threw their line south into the northwestern Ukraine. A Russian counteroffensive, however, soon swept the Poles back to Warsaw's gates (August, 1920). Only the severity of the terms proposed by the Russians prevented the closing of the war with a Russian victory. Confronted by a desperate situation, Poland turned at bay and, aided by French leadership and Allied munitions, once more resumed the attack. The Russians had pressed too far beyond the lines of their communications. By the end of August, the Russians were in retreat and General Pilsudski had reached the line held by the Germans in 1918 on the eve of Brest-Litovsk.
